## **EFFECT OF BOARD DIVERSITY AND CORPORATE GOVERNANCE STRUCTURE ON OPERATING PERFORMANCE: EVIDENCE FROM THE NEPALESE ENTERPRISES**

**Radhe S. Pradhan, Ph. D., Ritu Kumari Gupta, Rupa Chand,  
Sabeena Sadaula, Sangita Saud, and Sapana Ambai**

**Introduction:** Corporate governance is defined as the set of procedures laws, policies and institutions influencing the way a corporation is administered or managed. Corporate governance has been referred to as a collective group of people united as one body with power and authority to direct, control and rule an organization (Ruin, 2001). Corporate governance is the system by which businesses are directed and controlled (Cadbury, 1992). It is a set of relationships between a company's management, its board, its shareholders and Stakeholders. Hilland Jones (2001) asserted that corporate governance from a managerial perspective refers to the control used to ensure that managers' actions are consistent with the interest of key constituent shareholders. The conflicts of interest among the contractual parties in a firm are a main focus of corporate governance literature. According to Jensen and Meckling (1976), the three main parties with the potential for such a conflict are the directors, the shareholders, and debtors. The aim of corporate governance is to protect the shareholders from self-interest of the directors so that they can get fair return on their investment. There will be greater agency problem, where corporate governance mechanisms are weak (Guli *et al.*, 2012). According to Kang *et al.* (2007) and Ferreira (2010), corporate board structured along with demographic diversity such as gender, age, ethnicity etc. is efficient in protecting the interest of the shareholders and other stakeholders better and add value to the performance of the firm. Board diversity as a corporate governance concept has recently caught the attention of policymakers, managers, directors, shareholders, and academia (Johansen, 2008). Shrader *et al.* (1997) examined firm financial performance with gender diversity at the middle and upper management, and at the board of director levels for large firms. The result found that there is positive relationship of board diversity on operating performance. Kang and Shivdasan (1995) examined the role of corporate governance mechanisms during top executive turnover in Japanese corporations. And the study found that the likelihood of non-routine turnover is significantly related to industry-adjusted return on assets, excess stock returns and negative operating income, but is not related to industry performance. Burke (2000) found significant correlation coefficients between the number of women directors and revenue, assets and profit margins for Canadian firms. Fondas (2000) argued that the presence of women directors helps a board execute its strategic function because their experience is often closely aligned with company needs. Farrell and Hersch (2005) found that women tend to serve on better performing firms. Smith *et al.* (2006) revealed that the proportion of women in top management tends to have positive effects on firm performance. Adams and Ferreira (2009) found that female director have a positive impact on board inputs and firm outcomes. According to Jensen (1993) and Yermack (1996), as the board size increases there arises the problem of communication and coordination and decreased the ability of the board to control management, thereby leading to agency problems. The result also found that larger boards can make coordination, communication, and decision making more cumbersome than the smaller board. Sami *et al.* (2011) found that composite measure of corporate governance is positively and significantly associated with firm performance and valuation. Dalton *et al.* (1998) revealed the mixed findings on the relationship between board independence and CEO duality and firm performance. The result revealed that neither board composition (proportion of independent directors) nor board leadership structure (CEO duality) has been consistently linked to firm performance. Rhoades *et al.* (2001) found a significant relationship between CEO duality and firm performance. Chen *et al.* (2005) examined the relationship between the partnership structure, company performance and dividend policies in companies operating in

Hong Kong and found a negative relation between duality and Tobin Q (for large companies). But no relation has been found between duality and ROA or ROE. Abdul *et al.*(2006) argued that lesser number of audit committee meetings improve financial performance of the firm as it reduced the additional cost that incurred with every meeting. Majumdar (1997) revealed that there is negative and significant relationship between leverage and corporate performance. Peni and Vahamaa (2012) investigated that firm size has a significant positive influence on firm profitability. Burson (2007) found negative relationship between firm size and profitability. Shleifer and Vishny (1997) argued that large block shareholders have a positive effect on firm value and be an effective device to monitor management. Javid and Robina (2007) found that there is a positive relationship between ownership concentration and firm performance. Finch and Shivdasini (2006) revealed that the boards that meet more frequently are valued less by the market. Mangena and Tauringana (2008) argued that a positive relationship between the frequency of board meetings and corporate performance of a firm. Further, frequent meetings intermingled with informal side line interactions can create and strengthen cohesive bonds among directors and thereby impact positively on corporate performance (Lipton and Lorsch, 1992). Adnan *et al.* (2011) found that among the corporate governance variables, smaller the board size and higher the ratio of block ownership consistently seems to have better efficiency. However, the rest of the corporate governance variables do not seem to have significant and consistent impact on efficiency. In the context of Nepal, Pradhan and Adhikari (2009) showed that there exist a positive relationship between corporate governance practice and firm performance. Shah *et al.* (2013) found that bigger board and audit committee size and lower frequency of board meeting and lower proportion of institutional ownership lead to better efficiency in the commercial banks. Poudel and Hovey (2012) revealed that positive relationship of audit committee size with bank efficiency. The result also explained positive relationship of board size with bank efficiency while negative relationship of board meeting with bank efficiency. Silwal (2011) revealed that corporate governance has significant impact on firms' performance based on return on assets as well as board size, and leverage have negative and significant effect on firm performance however, age of the firm and audit committee have positive effect on firm performance based on return on equity. Guragain *et al.*(2016) argued that firm size has a positive significant impact on the ROA in the financial institutions in Nepal. Sharma *et al.* (2014) found that there is positive impact of corporate governance on ROE in the financial institutions mainly commercial banks and also concluded that the impact of board size and firm size are positively significant with ROE. Lama *et al.* (2015) concluded leverage has a negative impact on ROE, whereas board size has a positive impact on ROE. Thapa *et al.* (2013) argued that leverage has positive relation with return on asset while negative relationship with the return on equity of Nepalese enterprises. Thagunna and Poudel (2013) revealed that there were no differences in the efficiency levels of banks according to their asset size. The above discussion reveals that there is no consistency in the findings of various studies concerning the impact of board diversity and corporate governance on operating performance. The major objective of this study is to find out the impact of board diversity and corporate governance on operating performance. More specifically, it examines the impact of duality, outside directors, board diversity, board size, audit committee, board meeting, block shareholders, firm size, and leverage on operating performance. The remainder of this study is organized as follows. Section two describes the sample, data and methodology. Section three presents the empirical results and the final section draws conclusion and discuss the implications of the study finding.

**Methodology:** The study is based on secondary data of 20 enterprises consisting of 10 banking and 10 insurance companies with 100 observations for the period of 2011/12 to 2015/16 in Nepal. The data are collected from the Banking and Financial Statistics and Bank Supervision Report published by Nepal Rastra Bank and annual reports of selected Nepalese enterprises. The data were collected on board size, board meeting, audit committee, board diversity, block shareholders, CEO duality, leverage and firm size.

Table 1 shows the list of enterprises selected for the study along with study period and number of observations.

**Table 1: Number of enterprises selected for the study along with study period and number of observations**

S.N	Name of enterprises	Study period	Observation
<b>Insurance companies</b>			
1	National Premier Insurance Company	2011/12-2015/16	5
2	Himalayan General Insurance Company	2011/12-2015/16	5
3	Asian Insurance Company	2011/12-2015/16	5
4	Guras Life Insurance Company	2011/12-2015/16	5
5	NBNational Insurance	2011/12-2015/16	5
6	Shikhar Insurance Company	2011/12-2015/16	5
7	Sagarmatha Insurance Company	2011/12-2015/16	5
8	Surya Insurance Company	2011/12-2015/16	5
9	Nepal Life Insurance Company	2011/12-2015/16	5
10	National Life Insurance Company	2011/12-2015/16	5
<b>Commercial banks</b>			
11	NMB Bank Limited	2011/12-2015/16	5
12	Laxmi Bank Limited	2011/12-2015/16	5
13	Nabil Bank Limited	2011/12-2015/16	5
14	SBI Bank Limited	2011/12-2015/16	5
15	Nepal Investment Bank Limited	2011/12-2015/16	5
16	Bank Of Kathmandu Limited	2011/12-2015/16	5
17	Everest Bank Limited	2011/12-2015/16	5
18	Sanima Bank Limited	2011/12-2015/16	5
19	Himalayan Bank Limited	2011/12-2015/16	5
20	Kumari Bank Limited	2011/12-2015/16	5
	<b>Total</b>		<b>100</b>

Thus, the study is based on 100 observations.

### The Model

As the first approximation, the model estimated in this study assumes that the operating performance depends on several independent variables. Therefore, the model takes the following form:

#### Model 1

$$ROE = \beta_0 + \beta_1BDV_{it} + \beta_2BSIZE_{it} + \beta_3AUCOM_{it} + \beta_4BMET_{it} + \beta_5BHS_{it} + \beta_6DUAL_{it} + \beta_7FMZ_{it} + \beta_8LEV_{it} + e_{it}$$

#### Model 2

$$MPS = \beta_0 + \beta_1BDV_{it} + \beta_2BSIZE_{it} + \beta_3AUCOM_{it} + \beta_4BMET_{it} + \beta_5BHS_{it} + \beta_6DUAL_{it} + \beta_7FMZ_{it} + \beta_8LEV_{it} + e_{it}$$

Where,

ROE= Return on equity is defined as net income to shareholder equity.

MPS = Market price per share is defined as average of beginning and ending year market price per share.

BDV= Board diversity is defined as the proportion of women directors to the number of directors on the board of company.

BSIZE= Board size is defined as the absolute number of directors on the board of a company.

AUCOM= Audit committee is defined as the number of member in audit committee.

BMET= Board meeting is defined as the absolute number of meeting held by board of directors.

BHS= Block shareholders is defined as the proportion of board members who have at least 5% company's shares to the number of directors on the board.

DUAL= Duality is defined as 1 if CEO and chairman are same or 0 if it is different.

FMZ= Firm size is defined as the total assets of a company.

LEV= Leverage is defined as the ratio of total debt to total equity.

**Board diversity:** Board diversity is defined as the proportion of women directors to the number of directors on the board of companies. Erhardt *et al.* (2003) argued that correlation and regression analyses of board diversity are positively associated with the financial indicators of firm performance. Adler (2001) showed a strong correlation between women-friendly firms and high profitability. Carter *et al.* (2003) found a positive relationship between board diversity (in terms of women and minorities) and firm value. Based on it, this study develops the following hypothesis.

*H1: There is the positive relationship between board diversity and operating performance.*

**Board size:** Board size is defined as the absolute number of directors on the board of a company. Jensen (1994) revealed that large board is less effective than small board. Gill and Mathur (2011) found negative association between board size and firm performance. However, Johl *et al.* (2015) indicated that board size is positively related to firm performance. Dalton *et al.* (1999) showed positive relationship between board size and firm performance. Nuryanah and Islam (2011) showed that larger the board size better would be the firm performance. Based on it, this study develops the following hypothesis.

*H2: There is the positive relationship between board size and operating performance.*

**Audit committee:** Audit committee is defined as the number of member in audit committee. DrorParnesa (2011) found that effective audit committee measured by a high number of experts on the committee enhances the reporting quality. Abbott and Parker (2000) showed that a significant inverse relationship between audit committee and firm performance. Kyereboah-Coleman (2008) established favourable outcome of frequent audit committee meetings on market measures of firm performance. Based on it, this study develops the following hypothesis.

*H3: There is positive relationship between audit committee and operating performance.*

**Board meeting:** Board meeting is defined as the absolute number of meeting held by board of directors. Ntim (2009) found that a higher frequency of board meetings can result in a higher quality of managerial monitoring and thereby impacts positively on corporate financial performance. Peng *et al.* (2007) revealed that regular meeting attendance is considered a hallmark of the conscientious director. Karamanou and Vafeas (2005) found a positive association between board meeting frequency and the accuracy of management earnings forecasts. Based on it, this study develops the following hypothesis.

*H4: There is positive relationship between board meeting and operating performance.*

**Block shareholders:** Block shareholders is defined as the proportion of board members who have at least 5% company's shares to the number of directors on the board. Block holders are shareholder owning a large amount of stock generally institutional investors. Shleifer and Vishny (1997) found that firm performance is positively related to the presence of larger shareholder. The result also revealed that large block shareholders have a positive effect on firm value and be an effective device to monitor management. Shleifer and Wolfenson (2002) showed that concentration of ownership is considered as a

solution to solve the agency conflicts. Agrawal and Mandelker (1990) explained that firm performance could be improved by merging ownership and managerial interests through concentration of ownership. Based on it, this study develops the following hypothesis.

*H5: There is positive relationship between block shareholders and operating performance.*

**CEO Duality:** CEO duality is defined as 1 if CEO and chairman are same and 0 if it is different. Sheikh *et al.* (2013) found no significant difference in performance of companies with and without role duality. The results were found to be mixed in sign and statistically insignificant. Brickley *et al.* (1997) also found no systematic link between duality status and organizational performance or market value. Abdullah (2004) showed that no relation has been found between duality and company performance. Velnampy and Pratheepkanth (2012) revealed that duality has negative effect on company performance in a section of the study concerning the structure of corporation leadership. Based on it, this study develops the following hypothesis.

*H6: There is negative relationship between CEO duality and operating performance.*

**Firm Size:** Firm size is defined as the total assets of a company. Majumdar (1997) investigated the impact that firm size has on profitability and productivity of a firm and found that firm size has positive impact on the performance. Burson (2007) revealed that firm size has positive significant relationship with the return on assets (firm performance). Ekwe and Duru (2012) argued that there is a strong positive relationship between firm size and financial performance. Based on it, this study develops the following hypothesis.

*H7: There is positive relationship between firm size and operating performance.*

**Leverage:** Leverage is defined as the ratio of total debt to total equity. Abor (2007) indicated the positive relationship between corporate governance (CG) and leverage and identified that the firms having a good corporate governance practices has more chances to get debt financing than those have not implement the good corporate governance practices. The result also found that firm with good corporate governance are able to pay off their dues, interest and debt on time. Kyereboah-coleman and Biekpe (2006) found that leverage has positive and significant association with performance. Based on it, this study develops the following hypothesis.

*H8: There is positive relationship between leverage and operating performance.*

### 3. Result and discussions

#### Descriptive statistics

Table 2 presents the descriptive statistics of selected dependent and independent variables during the period 2007/08 to 2014/15.

#### Table 2: Descriptive statistics

*(This table shows the descriptive statistics of dependent and independent variables. Dependent variables are MPS (market price per share defined as average of beginning and ending year market price per share, in rupees), ROE (return on equity defined as net income to shareholder equity, in percentage) and independent variables are BSIZE (board size defined as the absolute number of directors on the board of a company, in number), BMET (board meeting defined as absolute number of meeting held by board of directors, in number), AUCOM (audit committee defined as number of member in audit committee, in number), BDV (board diversity defined as the proportion of women directors to the no of directors on the board of company, in number), BHS (block shareholders defined as the proportion of board members who have at least 5 % interest in company's shares to the number of directors on the board, in percentage), DUAL (CEO duality defined as 1 if CEO and chairman are same or 0 if different CEO and chairman), LEV (leverage is defined as the ratio of total debts to total assets, in percentage) and FMZ (firm size defined as the total assets of a company, in rupees). The descriptive statistics are based on panel data*

of 20 enterprises (10 banks and 10 insurance companies) with 100 observations for the period 2011/12-2015/16 in Nepal).

	Minimum	Maximum	Mean	Std. Deviation
ROE	-.01	46.20	9.46	11.40
MPS	66.00	4351.00	818.40	827.89
BDV	.00	2.00	0.27	0.58
BSIZE	5.00	11.00	7.32	1.32
AUCOM	1.00	4.00	3.07	0.62
BMET	8.00	106.00	16.83	14.95
BHS	.00	0.50	0.07	0.14
DUAL	.00	1.00	0.05	0.22
LEV	11.87	94.49	72.45	24.09
FMZ	-1.32	3.81	1.55	1.50

**Correlation analysis:** Having indicated the descriptive statistics, Pearson's correlation coefficients are computed and the results are presented in Table 3. More specifically, it shows the correlation coefficients of dependent and independent variables of Nepalese enterprises.

Table 3 reveals the positive relationship of board size and audit committee with operating performance. This indicates that increase in board size and audit committee leads to increase in operating performance. Similarly, the result also shows the positive relationship firm size and leverage which means that increase in firm size and leverage leads to increase in operating performance. However, board diversity and block share holder have negative relationship with operating performance. This reveals that increase in board diversity and block shareholders leads to decrease in operating performance. Likewise, the result also shows the negative relationship of CEO duality with performance which denotes that increase in duality leads to decrease in operating performance. The result also shows the negative relationship of board meeting with return on equity. This reveals that increase in board meeting leads to decrease in return on equity whereas board meeting has positive relationship with market price per share.

**Table 3: Pearson's correlation coefficients matrix for Nepalese enterprises**

(This table reveals the bivariate Pearson correlation coefficients of different dependent and independent variables. The coefficients are based on the data from 20 Nepalese enterprises (10 banks and 10 insurance companies) with 100 observations for the period 2011/12 to 2015/16. Dependent variables are ROE (return on equity defined as net income to shareholder equity, in percentage) and MPS (market per share defined as average of beginning and ending year market price per share, in rupees) and independent variables are BSIZE (board size defined as the absolute number of directors on the board of a company, in number), BMET (board meeting defined as absolute number of meeting held by board of directors, in number), AUCOM (audit committee defined as number of member in audit committee, in number), BDV (board diversity defined as the proportion of women directors to the no of directors on the board of company, in number), BHS (block shareholders defined as the proportion of board members who have at least 5 % interest in company's shares to the number of directors on the board, in percentage), DUAL (duality defined as 1 if CEO and chairman are same or 0 if different CEO and chairman), LEV (leverage is defined as the ratio of total debts to total assets, in percentage) and FMZ (firm size defined as the total assets of a company, in rupees).

Variables	ROE	MPS	BDV	BSIZE	AUCOM	BMET	BHS	DUAL	FMZ	LEV
-----------	-----	-----	-----	-------	-------	------	-----	------	-----	-----

<b>ROE</b>	1									
<b>MPS</b>	.269**	1								
<b>BDV</b>	-.066	-.030	1							
<b>BSIZE</b>	.037	.101	.189	1						
<b>AUCOM</b>	.380**	.298**	.059	.022	1					
<b>BMET</b>	-.027	.023	.094	-.033	-.115	1				
<b>BHS</b>	-.337**	-.132	-.134	-.137	-.150	.097	1			
<b>DUAL</b>	-.191	-.154	-.107	-.231*	-.396**	.021	.158	1		
<b>FMZ</b>	.604**	.345**	.132	.195	.283**	-.155	-.487**	-.280**	1	
<b>LEV</b>	.593**	.009	.092	.245*	.159	-.180	-.301**	.105	.639**	1

Note: The asterisk signs (\*\*) and (\*) indicate that coefficients are significant at 1 percent and 5 percent levels respectively.

**Regression analysis:** Having indicated the Pearson's correlation coefficients, the regression analysis has been carried out and the results are presented in Table 4. More specifically, the table shows the regression results of CEO duality, outside directors, board diversity, board size, board meeting, audit committee and block shareholders, firm size and leverage on return on equity. Table 4 shows that the beta coefficients are positive for board size. It indicates that larger the board size, higher would be the return on equity. This finding is similar to the findings of Johl *et al.* (2015). However, the beta coefficients are negative for audit committee. It denotes that higher the number of member in audit committee, lower would be the return on equity. This finding is similar to the findings of Abbott and Parker (2000). On the other hand, beta coefficients are negative for board diversity which means that higher the proportion of women directors in board, lower would be the return on equity. This finding is not consistent with the findings of Carter *et al.* (2003). Similarly, beta coefficients are negative for block shareholders. This reveals that higher the block shareholders, lower would be the return on equity. This finding is not consistent with the findings of Shleifer and Vishny (1997). The beta coefficient for the CEO duality is also negative which indicates that higher the CEO duality, lower would be the return on equity. This finding is similar to finding of Velnampy and Pratheepkanth (2012). Furthermore, the beta coefficients are negative for board meeting which means that higher the number of board meeting, lower would be the return on equity. This finding is not consistent with the findings of Karamanou and Vafeas (2005).

**Table 4: Estimated regression results of BSIZE, BMET, BDV, BHS, DUAL, LEV, and FMZ on ROE**

(The results are based on panel data of 20 enterprises (10 banks and 10 insurance companies) with 100 observations for the period of 2011/12 to 2015/16 by using linear regression model. The model is  $ROE = \beta_0 + \beta_1 BDV_{it} + \beta_2 BSIZE_{it} + \beta_3 AUCOM_{it} + \beta_4 BMET_{it} + \beta_5 BHS_{it} + \beta_6 DUAL_{it} + \beta_7 FMZ_{it} + \beta_8 LEV_{it} + e_{it}$  where, the dependent variable ROE (return on equity defined as net income to shareholder equity, in percentage) and independent variables are BSIZE (board size defined as the absolute number of directors on the board of a company, in number), BMET (board meeting defined as absolute number of meeting held by board of directors, in number), AUCOM (audit committee defined as number of member in audit committee, in number), BDV (board diversity defined as the proportion of women directors to the no of directors on the board of company, in number), BHS (block shareholders defined as the proportion of board members who have at least 5 % interest in company's shares to the number of directors on the board, in percentage), DUAL (duality defined as 1 if CEO and chairman are same or 0 if different CEO and chairman), LEV (leverage is defined as the ratio of total debts to total assets, in percentage) and FMZ (firm size defined as the total assets of a company, in rupees).

Model	Intercept	Regression coefficients ROE								Adj R <sup>2</sup>	S.E. E	F
		BSIZE	BMET	AUCOM	BDV	BHS	DUAL	LEV	FMZ			
1	7.14	0.32								0.00	11.4	0.13

	(1.1)	(0.36)								1	5	2
<b>2</b>	9.81 (5.7)**		-0.29 (-0.26)							0.001	11.45	0.07
<b>3</b>	-11.85 (-2.22)*			6.94 (4.06)*						0.14	10.6	16.51
<b>4</b>	9.81 (7.78)*				-1.3 (-0.66)					0.004	11.43	0.43
<b>5</b>	11.33 (9.44)*					-27 (-3.55)**				0.11	10.78	12.6
<b>6</b>	9.96 (8.63)*						-9.92 (-1.92)			0.03	11.25	3.7
<b>7</b>	-10.85 (-3.7)**							0.28 (7.28)**		0.34	9.23	53.03
<b>8</b>	2.35 (1.78)								4.6 (7.5)*	0.35	9.14	56.16
<b>9</b>	10.07 (5.64)*		-0.02 (-0.2)		-1.26 (-0.63)					0.01	11.49	0.24
<b>10</b>	-8.15 (-1.04)	0.11 (0.13)		6.25 (3.78)*	-2.52 (-1.41)	-24.2 (-3.29)**				0.21	10.14	7.53
<b>11</b>	-17.55 (-3.46)**			3.84 (2.62)*	-3.27 (-2.3)*	-5.73 (-0.87)	-4.48 (-0.99)	0.19 (3.95)**	1.91 (2.23)*	0.49	8.14	16.84

Note: The asterisk signs (\*\*) and (\*) indicate that coefficients are significant at 1 percent and 5 percent levels respectively.

The beta coefficients are positive for the leverage. This reveals that higher the leverage, higher would be the return on equity. This finding is similar to the findings of Abor (2007). Likewise, the beta coefficients for the firm size are positive which indicates that larger the firm size, higher would be the return on equity. This finding is similar to the findings of Ekweand Duru(2012).

Similarlry, the estimated regression of OUD, BSIZE, BMET, AUCOM, BDV, BHS, DUAL, LEV and FMZ on MPS are presented in Table 5.

**Table 5: Estimated regression results of OUD, BSIZE, BMET, AUCOM, BDV, BHS, DUAL, LEV and FMZ on MPS of Nepalese enterprises**

(The results are based on panel data of 20 enterprises (10 banks and 10 insurance companies) 100 observations for the period of 2011/12 to 2015/16 by using linear regression model. The model is  $MPS = \beta_0 + \beta_1BDV_{it} + \beta_2BSIZE_{it} + \beta_3AUCOM_{it} + \beta_4BMET_{it} + \beta_5BHS_{it} + \beta_6DUAL_{it} + \beta_7FMZ_{it} + \beta_8LEV_{it} + e_{it}$  where, the dependent variable MPS (market price per is defined as average of beginning and ending year

market price per share, in rupees) ) and independent variables are *BSIZE* (board size defined as the absolute number of directors on the board of a company, in number), *BMET* (board meeting defined as absolute number of meeting held by board of directors, in number), *AUCOM* (audit committee defined as number of member in audit committee, in number) , *BDV* ( board diversity defined as the proportion of women directors to the no of directors on the board of company, in number), *BHS* (block shareholders defined as the proportion of board members who have at least 5 % interest in company's shares to the number of directors on the board, in percentage), *DUAL* (duality defined as 1 if

*CEO* and chairman are same or 0 if different *CEO* and chairman), *LEV* (leverage is defined as the ratio of total debts to total assets, in percentage) and *FMZ* (firm size defined as the total

assets of a company, in rupees).

Note: The asterisk signs (\*\*) and (\*) indicate that coefficients are significant at 1 percent and 5 percent levels respectively.

Table 5 shows that the beta coefficients are positive for board size. It indicates that larger the board size, higher would be the market price per share. This finding is similar to the findings of Johl *et al.* (2015). The beta coefficients are positive for audit committee. It denotes that higher the number of member in audit committee, higher would be the return on equity. This finding is similar to the findings of Kyereboah-Coleman (2008). On the other hand, beta coefficients are negative for board diversity which means that higher the proportion of women directors in board, lower would be market price per share. This finding is not consistent with the findings of Carter *et al.* (2003). Similarly, beta coefficients are negative for block shareholders. This reveals that higher the block shareholders, lower would be the market price per share. This finding is not consistent with the findings of Shleifer and Vishny (1997). The beta coefficient for the CEO duality is also negative which indicates that higher the CEO duality, lower would be the return on equity. This finding is similar to finding of Velnampy and Pratheepkanth (2012). Furthermore, the beta coefficients are positive for board meeting which means that higher the number of board meeting, higher would be the return on equity. This finding is similar to the findings of Karamanou and Vafeas (2005). Likewise, the beta coefficients are positive for the leverage. This reveals that higher the leverage, higher would be the return on equity. This finding is similar to the findings of Abor (2007). The beta coefficients for the firm size are positive which indicates that larger the firm size, higher would be the return on equity. This finding is similar to the findings of Burson (2007).

**Summary and conclusion:** Corporate governance is the mechanisms, processes and relations by which corporations are controlled and directed. Governance structures and principles identify the distribution of rights and responsibilities among different participants in the corporation (such as the board of directors, managers, shareholders, creditors, auditors, regulators, and other stakeholders) and include the rules and procedures for making decisions in corporate affairs. Corporate governance includes the processes through which corporations' objectives are set and pursued in the context of the social, regulatory and market environment. A critical factor in good corporate governance appears to be the relationship between board diversity and shareholder value creation. The study attempts to examine the effect of board diversity and corporate governance structure on operating performance in the Nepalese enterprises. This study is based on secondary data of 20 enterprises for the period 2011/12-2015/16. The variables that examine the effect of board diversity and corporate governance structure on impact of operating performance are board size, board meeting, audit committee, board diversity, block shareholders, CEO duality, leverage and firm size. The study shows that audit committee and firm size has positive and significant impact on operating performance. It indicates that higher the audit committee and firm size, higher would be operating performance. The study also reveals that there is positive impact of board size, leverage and board meeting on operating performance. However, board diversity, block shareholder and CEO duality have negative impact on the return on equity. It indicates that higher the board diversity, block shareholder and CEO duality, lower would be the operating performance.

## **THE STATUS AND MANAGEMENT OF CORPORATE SOCIAL RESPONSIBILITY (CSR): THE CASE OF MAURITIUS**

**Rajen Suntoo**

*Senior Lecturer in Sociology, University of Mauritius*

### **Introduction:**

Mauritius has been a success story in nearly all domains – social, economic, environmental and political – since its independence in 1968. It is a fact that democracy is vibrant in the society. Frankel (2010) rightly points out that, “*Mauritius has made some wise policy decision*’ during the past decades. The Mauritian state has been very proactive in many areas to develop policies and institutionalizing same to cater for the needs of the population. According to the 2017 Mo- Ibrahim Index, Mauritius retains its first rank regarding good governance among the African countries. This is so for the last few years. There is the perception that the established companies and businesses of the private sector – economic and financial institutions, hotels, EPZ firms and the offshore businesses – lay lot of emphasis on good governance as they are the backbone behind the economic success of the country. The private sector has most of the time responded positively to the demand of the government. Its contribution to make Corporate Social Responsibility a reality was well received by the population of the island in 2009. When the government in 2009 decided to make CSR mandatory, the private sector resisted at first before accepting to cooperate. Nevertheless, there have been constantly criticisms levelled on the operation and management of the CSR by many stakeholders, more particularly by the civil society organisations. Consequently, the Mauritian state has taken several steps to review the management of CSR. The recent one was in 2016/17 budget. Given that, the proper management of CSR will be beneficial to all stakeholders – Government, Private Sector and the Public - it is highly recommended that any country embarking on such an activity should set up the proper institutions so that funds are judiciously spent with a view to bring further socio-economic justice within the society. The main aim of this paper is to provide an overview on the status and management of Corporate Social Responsibility (CSR) in Mauritius. This paper will also discuss what has been done and what needs to be done to have an efficient and effective CSR institution which meets the expectations of the population in areas like poverty reduction, supporting the poor to achieve academically, conservation of green environment, building of houses for the needy, combatting environment pollution and catering for vulnerable old age, sick and handicapped people. The paper will now provide the methodology used to do this piece of research followed by a literature review on the subject matter. The findings and analysis of the data collected will help us to come up with few important ideas and opinions that will add some new knowledge in the CSR domain and its management. Finally, the way forward will be stated.

**Methodology:** In this paper, both primary and secondary data have been used. The analysis and discussion of secondary data, from journals and government documents and some important primary data, obtained from interviewing eight respondents from the CSR field or who have knowledge on it, contribute to come up with certain views and opinions to be considered by the authority for improvement of CSR activities and services.

### **Literature Review:**

The literature review below will enlighten the CSR concept through the relevant studies on the subject matter. An overview of the CSR, which is mandatory in Mauritius, is also provided for readers to understand better its implementation in the Mauritian context.

Howard R. Bowen (1953) can be regarded as the pioneer to have discussed business ethic and social responsibility in his publication entitled, 'Social Responsibilities of the Businessman'. Carroll (1999) referred to Bowen as the, "Father of Corporate Social responsibility".

For Milton Friedman (1970), the primary responsibility of a business is to profit making and in particular, increasing the firm's value and maximising shareholders' revenue. In Society, the only responsibility of businesses is to operate without deception or fraud. Carroll agrees with Milton on the ground that the main aim of businesses should be profit maximization and increasing the firm's value.

In his model of social responsibility, Carroll (1991) lays emphasis on the ethical and discretionary responsibilities of businesses in addition to their economic and legal ones. For him, a responsible business enterprise should also undertake social responsibility over and above its economic and legal responsibilities. Businesses need to avoid doing harm to the environment where it operates, for instance avoiding polluting the area. The surrounding community needs to be looked after by the business enterprises. Through social roles, the private sector may take social projects to improve the lives of the population in the community.

Carroll (1991) argued that there are four kinds of social responsibilities which constitute the CSR. They are Economic, Legal, Ethical and Philanthropic which may be summarized as a firm operating in such a way to make profits, abide by the law, follow ethics, and be a good corporate citizen.

The term CSR became more popular by late 1990s. The German company Betapharm, faced with a fall in its sales of pharmaceuticals products in 1998, decided to adopt and implement a CSR programme whereby it helped the vulnerable and sick children allowing them to regain their health by promoting healthy ways of expressing feeling. Shortly after, this CSR activity resulted into an increase in the sales of the company (Habisch et al, 2008).

It is a fact that since the past few decades, the world has witnessed a slow rise in voluntary societal responsibilities by private businesses. Companies have embarked on social investment with a view to increase their sales, consolidate their goodwill and retain skilled employees.

The European Commission (2001) defines Corporate Social Responsibility (CSR) as 'a concept whereby companies integrate social and environmental concerns in their business operations and in their interaction with their stakeholders on a voluntary basis'. For the World Business Council for Sustainable Development (1998), CSR is the confining commitment by business to behave ethically and contribute to economic development while improving the quality of life of the workforce and their families as well as the local community and society at large. On the other hand, Ismael (2009) refers to corporate social responsibility as strategies for corporations or firms to conduct their business in a way that is ethical, society friendly and beneficial to community in terms of development. In fact, Corporate Social Responsibility is mostly understood to be the way firms combine social, environmental and economic concerns into their values, decision making, culture, strategy and operations in a transparent and accountable way.

The social responsibility of an organization is that it needs to assess the impact of its decisions on society and the environment through ethical and transparent behavior that is in line with the welfare of the society as well as sustainable development. This responsibility shows that the organizations have to comply with legislation of the host country and to be consistent with the international norms of behaviour and voluntarily take initiatives to improve the well-being of their employees and their families as well as for the local community and society.

Furthermore, according to World Bank (2006) (Cited in Idowu, S.O. & Filho, W. L. 2008) , CSR refers to the "*commitment of business to contribute to sustainable economic development, working with employees, their families, local community and society at large to improve the quality of life in ways that are both good for business and good for development*". Thus, CSR is seen as a sustainable process which helps in

balancing the three pillars of sustainable development which are the economic growth, social development and environmental protection.

The Indian Government introduced the corporate social responsibility in the Company Law in 2013 enabling larger companies to spend 2% of their profits for the welfare of the population, more particularly for the poor in areas like poverty alleviation, promoting education and improving health amongst others which are defined in the Bill. However, the law does not force the companies to undertake such activities. A study carried out by Ovais & Singh (2013) states that although many companies abide by the provision of the Company Law, yet almost all of them are against any move to make corporate social responsibility mandatory which is thought to be counterproductive.

From the above, we find that the social component attached to CSR, whereby businesses have a moral obligation to help the society and its members in various ways, is slowly becoming widely acceptable in businesses by international organisations. We also notice that CSR still remains a voluntary engagement on the part of business operators.

**Overview of CSR in Mauritius:** Mauritius is a rare country in the world where Government took the decision to make CSR mandatory during its introduction in 2009. All registered companies, had to abide by the 2009 Income Tax Act, to contribute 2% of their book profits towards approved social programmes which were thought to bring socio-economic justice towards the population, mostly the vulnerable ones. Although there were some resistance initially on the part of the business community yet the latter finally agreed to play the social roles for the benefits of the citizens. By 2010, the Government authority reviewed the social programmes of 2009 and came up with a new list of social programmes on which the CSR fund could be utilized. The priority areas included, amongst others, social housing, combating absolute poverty and community development, looking after the welfare of children from vulnerable groups. In January 2012, further amendments were brought to manage the CSR. The basis of the 2% CSR contribution was modified to 'profits chargeable to income tax' as compared to book profits. In addition to, a new area of intervention was added to the list of social programmes namely 'prevention of non-communicable diseases'. Consequently, profitable businesses could utilize 50% of its CSR fund on projects and social programmes as defined by the National Empowerment Fund which operated under the aegis of the Ministry of Social Integration. A major change took place in 2015 when the government authority removed all guidelines to manage CSR and the registered companies were given the freedom to utilize their CSR fund according to their own CSR framework. This led to an abuse and misuse of the fund by the companies as they solely decided on the projects to be realized and through which organizations. There were a lack of transparency on the allocation of projects according to various stakeholders. Consequently, the state had to intervene in the following year to redress the situation. During the 2016/17 budget, Government announced a new CSR framework. Thus, followed the creation of the National Corporate Social Responsibility Foundation, under the aegis of the Ministry of Social Integration and Economic Empowerment, for the good management of the CSR by ensuring transparency and proper outcomes of the approved social programmes. With the application of the new CSR framework, profitable companies were required to contribute at least 50% of their CSR money, through the Mauritius Revenue Authority, to the National CSR Foundation.

The National CSR Foundation is managed by a council comprising members from the government, private enterprises, civil society and academic community.

The National CSR Foundation aims to deal with programmes and projects to maximize the social benefits and welfare of those vulnerable population registered under the Social Register of Mauritius (SRM) and of vulnerable groups in the following priority areas:

- (i) Socio-economic development as a means for poverty alleviation;
- (ii) Educational support and training;

- (iii) Social housing;
- (iv) Supporting people with disabilities;
- (v) Dealing with health problems;
- (vi) Family protection including gender-based violence;
- (vii) Leisure and sports;
- (viii) Environment and sustainable development;
- (ix) Peace and nation-building;
- (x) Road Safety and Security.

The CSR Foundation has also the responsibility to monitor and evaluate the social programmes to ensure proper implementation of same. Companies and the CSR Foundation can partner to finance certain NGOs which will carry out the social projects as defined in the established priority list of the Foundation. On the other hand, most of the big companies have their own CSR Foundations through which they meet the societal responsibility on social projects, which are in line with those areas of intervention as defined by the National CSR Foundation. Such an approach help them to keep connected with the society and local communities. This strategy support the companies to consolidate their goodwill. The Omnicane Group, Rogers Group and ENL Group are appropriate examples.

#### **Some examples of companies undertaking CSR activities**

**Omnicane Limited:** The Omnicane Group is dedicated to help the community and society. Besides, making its contribution to the Government authority as stipulated by law, the Omnicane CSR Foundation engaged itself in projects, like social housing, poverty alleviation, educational support to the needy, promotion of healthy living and conservation of environment, amongst others.

**ENL Group:** For the ENL Group, the corporate social responsibility (CSR) has become an integral part of its business. ENL regards it as a moral obligation to have social investment for the socio-economic and environmental development of the Mauritian Society. Since 2009, ENL has made a huge contribution in building social capital. Some areas of its invention include youth development, poverty alleviation, child welfare, sports activities and care for environment.

**Rogers Group of company:** The Rogers Foundation engaged itself towards the protection of the Coastal ecosystem. It supports projects which influence, educate and change the behaviour of the population regarding protection of ecosystems. Thus, in a way it helps to create awareness among the members of the public on the impacts of the degradation of the marine ecosystem. The Foundation also caters for poverty alleviation and promotion of local talents through financial and technical supports.

**Airports of Mauritius Limited (AML) CSR Unit:** AML is conscious of its social responsibility and as such, its budget for corporate social responsibility is being used to implement several social projects at both regional and national level in the fields of health, education, environment protection, poverty alleviation and protection of women and Children from violence. The CSR Unit has contributed to the realisation of an endemic mini-park at Ebène, which can be used for leisure by those working in the vicinity. The above examples show how big companies use their foundations to keep connected with the society. On the other hand, some companies collaborate with different Non-Governmental Organisations throughout the island to bring about more awareness through their CSR activities.

#### **Findings and Analysis**

Four questions were directed to the 8 respondents, 2 from the private sector and 2 from the public sector, 2 from civil society and NGOs and 2 from the public. The questions were as follows:

- Tell me about your views/opinions on mandatory CSR.
- What do you have to say on the management of the National CSR Foundation and its funding strategy?
- What can you say about the operation of CSR units or Foundations of the companies?

- What improvement do you think needs to be done to have more transparency regarding CSR management?

Although one or two questions seem to be leading ones to the respondents from public sector and private sector, for instance, Question 2 directed to the former and Questions 1 and 3 directed to the latter, yet I wanted to have their views/opinions given the importance of the subject matter. When asked about views on mandatory CSR, all respondents without any exception gave a positive reply by stating that it has been a good initiative by the government authority to require all companies making profits to contribute to a CSR fund for the socio-economic development of the society and improving the welfare of the vulnerable population. However, one respondent from the private sector disagreed about the quantum paid by companies. He argued that larger companies need to pay a relatively lower percentage of the contribution given that in absolute terms they pay a very high amount. When I probed further, the respondent added that big companies make far more effort to achieve higher profits which should be used instead to pay dividend to investors who make sacrifices through risky investment. Nevertheless, he agreed that CSR had to be mandatory. On the second question, there were lot of criticisms made by the respondents from the civil society and those from the public. They talked about lack of transparency when it came to allocating funds to Non-Government Organisations (NGOs), and also they doubted on the process followed to evaluate social projects submitted by NGOs and other civil society organisations. Besides, few respondents stressed that there was a perception among the population that influential members from the authority had their say as to who or which groups should be given certain services or fund. It was a surprise that the members of the private sector found everything in order with the management of CSR by government authority. Nevertheless, one respondent argued that the deliberation on the evaluation of social projects need to be done in public or in front of all those who submitted their projects. Another one from the public sector stated that written feedback needs to be provided to the unsuccessful institutions enabling them to improve their request in future. When I asked question 3, relating to management of CSR Units or Foundations of companies, similar criticisms were levelled by the respondents from the civil society as to lack of transparency in allocation of funds and doubts in the process of evaluation of projects. One of them went further to state that there is a perception that favouritism is practiced in certain cases by certain companies. Few organisations regularly benefit from funding for their social programmes while many have never got any sponsorship for their projects nor any feedback on the weaknesses of same. On the last question, almost all respondents viewed transparency and good governance should prevail in all activities performed by CSR body, be it governmental or owned by Companies. Two respondents, one from the civil society and one from the private sector strongly believed that CSR managed by the Government should have more autonomy and should not be under any Ministry. One respondent from the public was of opinion that so long Ministers or the Government nominate people to sit in such an organisation, there would never be transparency or good governance. When I probed, one respondent stated that nominated persons have an obligation to listen to their masters and they would do things accordingly which may be detrimental to the ethical way of operation. He added that CSR organisation should have its autonomy. The findings reveal that stakeholders lay much importance to CSR and its management. Given that all stakeholders appreciate that CSR is mandatory, it seems that they all understand the positive contributions that can be made to uplift the welfare of the population and the society if all stakeholders play their roles in an ethical and transparent manner. This is one way to bring an all- inclusive development of the society. Although it has a good initiative made by the Government recently to come up with the National CSR Foundation, under the aegis of the Ministry of Social Integration and Economic Empowerment, yet in the near future, it is crucial to have an autonomous institution to manage the CSR Fund, where professional qualified staff undertake the CSR activities in a more transparent way. As a result, they will be subject to accountability of their actions and relevant

sanctions applied by law if ever they fail in their duties due to conflict of interest or corrupt practices, amongst other.

**The way forward:** From the above, we find that CSR matters a lot to the different stakeholders. Consequently, the authority should regularly improve its operation and management. The important thing is funds devoted for CSR should be wisely used for the welfare of the population. Although both Government and the Private sector have joined hands for a good cause yet, the management of the CSR activities is constantly under criticism. The Authority needs to recruit professionally qualified people in the CSR domain to perform the CSR task. Companies and even Government authority have to ensure that such a noble duty is not left totally in the hands of volunteers or inexperienced people. Given that the funds allocated for such activities emanate from profits made due to hard work of so many employees, and also from risky investment made by investors, all care needs to be taken to judiciously use the CSR money for common good of all citizens.

## **SOCIO ECONOMIC ROLES OF THE STATE: WELFARE STATE IN MAURITIUS**

**Dr Beedun Abba**

*Senior Lecturer, MGI, Moka, University of Mauritius.*

**Introduction:** Mauritius is a small island situated in the Indian Ocean with a population of about 1.3 million people. Mauritius was ruled by three powerful nations namely the Dutch, the French and the British. The Dutch landed on this virgin island by accident after a shipwreck in 1598. The island being uninhabited, they named it Mauritius. They made attempts to settle in the island but were forced to abandon the country because of frequent natural calamities, particularly cyclones. After the departure of the Dutch, formal settlement resumed in 1721 under the French colonial rule. With slave labor imported from Madagascar and Africa, the French brought about considerable changes in the island and they rapidly developed the country which they named 'Ile de France'. The French Governors started the sugar industry which was to become the backbone of the Mauritian economy. This island was known for its fertile soil, sugar cane and crops such as manioc, cotton and so on. During the 18<sup>th</sup> century, there was much rivalry between the France and England. During the Napoleonic wars the French organized successful raids from Port-Louis on British trade and commercial vessels. The British who were tired of these naval attacks decided to capture the island and in 1810 they conquered the island from the French and renamed it Mauritius. It became a British colony and remained so until 12 March 1968 when it achieved independence. The British conquest was followed by rapid demographic, social and economic changes. For this to happen, the British had to come to terms with the influential and economically powerful former French colonials. To win the allegiance of this group, the British had to guarantee the continuity of French Language, culture and the Catholic Christian religion in the island. The period of British rule was of great historical importance for Mauritius. Slavery was officially abolished thanks to the efforts of William Wilberforce throughout the British Empire in 1830. The abolition of slavery brought in its wake a heavy economic problem. The emancipated slaves refused to work any longer in the sugarcane fields. The problem of labor in the island was a severe blow to the sugar industry. The whole agricultural activity was paralyzed. It had to be saved at all costs. The sugar estate and mill owners turned to the Indian sub-continent for indenturing cheap workers. The year 1834 indentured Indians started arriving in Mauritius coincided with the abolition of slavery. The indentured period was regarded by the employers as more or less a continuum of slavery as far as conditions of work and treatment of the indentured workers were conditioned. It was under such difficult conditions that the Indians started life in this country. The employers bent on retaining power, wealth and privilege, refused to consider any proposal for improvement in the conditions of the workers who were exploited and living below the poverty line. Our first Prime Minister Sir Seewoosagar Ramgoolam returned back from England in 1935 after completion of his studies. He was greatly influenced by the inflammatory writings of firebrands' politics like Lala Lajpat Rai and was much interested in the world movement for securing the freedom of the subjected people and for providing a better life for the working classes. He got the opportunity to meet Mahatma Gandhi, Shrinivasa Shastri and other Indian Leaders and from that time he began thinking of plans for colonial freedom from imperial rule. Sir Seewoosagar Ramgoolam became the first Prime Minister of Mauritius and independence was achieved in March 1968. Sir S. Ramgoolam who had to fight every inch of the way for social improvement was in a position to give full expression to his ideas by carrying out the projects he had conceived as foundation in the building of a socialist welfare state within the framework of liberal democracy. Welfare state is a system which caters for the population. In Mauritius we have countless benefits from the Government such as free medical facilities for one and all.

**Pillars of the welfare State**

**Education:** Free educational facilities at pre-primary, primary and at secondary level including free transport facilities to all students even for those studying at tertiary level. All the examination fees at school certificate level and higher school certificate conducted by the University of Cambridge are being funded by the Government, so that every citizen gets the opportunity to have easy access to education. All students of primary schools are provided with books, Tablets and related educational materials on CD/DVD. Government is running ICT free course to enable every citizen to become computer literate. Government is providing loan at a very low rate of interest for the purchase of computer or laptop. In order to encourage students to pursue higher studies state offers scholarships for the 10 best candidates in each subject. Due to our good diplomatic relationship with other European countries and India, we are receiving around 150 scholarships annually. Government provides scholarships and financial help to the children of low income earners Government gives loan facilities to students at a very low rate of interest. They pay back the loan only after completing their studies and securing a job.

**Social Services**

- Old age pensions is given to all citizens reaching 60 years, whether they were employed or not. So that they get a better standard of living. Actually pensioners are receiving about Rs 5,800 monthly and one month bonus at the end of year. The rate of pensions increases depending on the age group.
- Each employee apart their old age pension they receive an additional monthly pension on the basis of their years of services.
- There is a provision for monthly pensions for all widows irrespective of their age.
- Monthly pensions are equally given to all mentally and physically handicapped people.
- Free transport facilities are also provided to all pensioners, senior citizens, widows and mentally or physically handicapped people.

**Housing scheme:** Each year under this scheme government construct houses for the poor and low income earners people.

**Grants to Cultural and religious organizations:** Mauritius is a multiracial country where different ethnic groups live in peace and harmony. They give respect to each other and participate in various activities organized throughout the island. Government gives subsidies to all communities so that religious and cultural activities can be performed. Moreover the Government has setup various Cultural Centre Trusts and Speaking Unions for each ethnic group such as Hindi, Marathi, Tamil, Telugu, English, French, Bhojpuri, and Creole Speaking Unions. Mauritius is a unique Country in the world giving grants to all linguistics groups for the preservation of Language and culture.

**Grants to NGO:** In Mauritius as in other countries, we have lots of benevolent organizations catering for the upliftment of vulnerable and needy people. Government supports all the NGO's by providing them fund to meet their day to day expenses.

**Health:** Ever since Mauritius got its independence, it provides free medical facilities and medical assistance to all citizens including heart surgery as well. All Government hospitals give free treatment and free medicines. Nearly all the villages have a health care centre. They get Doctors visits once or twice a week. Senior citizens are being given free spectacles and check up.

**Negative Income Tax:** Another positive step taken by the Government for the vulnerable people is the introduction of negatives income tax. Basically negative tax system is a progressive income tax where low income earners do not have to pay tax; instead the Government gives them money according to the rate of income of low income earners.

**Conclusion:** Since our Independence successive Governments have made constant progress through their policies and actions which has resulted into the success story of the Mauritian nation. Nowadays we find modernity and development in all places in the country. Welfare state has become a culture in Mauritius.

No Government wants to curb the facilities offered under this model of welfare. All heads of states in Mauritius stood up with determination to consolidate the welfare state. They lay emphasis on the welfare state to harmonize the society by giving equal chances and all essentials things such as old age pension, workmen's compensation, free health treatment, intensive extension of free education services and housing accommodation. Today after the setting up of a welfare state, Mauritius is one among the fast developing countries in the world. We are landed on the road of social justice, peace, harmony and economic progress. All these achievements could happen only by the grace of our strong socio-economic and political leaders who made the right decisions whenever they had to do with welfare and care for the population.

## GST TAX ON GOOD'S & IT'S IMPACT ON INDIAN ECONOMY

Dr. R.K. Datir

Principal, S.M.B.S.T. College, Sangamner Tal- Sangamner, Dist- Ahmednagar, State- Maharashtra

### GST Tax Structure

#### 1) Zero Percent Tax on Goods (No Tax)

**No tax will be imposed on items like** - jute, fresh meat, fish chicken, eggs, milk, butter milk, curd, natural honey, fresh fruits and vegetables, flour, besan, bread, prasad, salt, bindi. Sindoor, stamps, judicial papers, printed books, newspapers, bangles, handloom, Bones and horn cores, bone grist, bone meal, etc.; hoof meal, horn meal, Cereal grains hulled, Palmyra jaggery, Salt - all types, Kajal, Children's' picture, drawing or colouring books, Human hair, Khadi purchased from Khadi and Village Industries stores, Clay idols, brooms, Cotton seed oil cake, Charkha, Guar meal, hop cone, certain dried vegetables, unworked coconut shell and fish, and bangles of lac/shellac.

**Services:** Hotels and lodges with tariff below Rs 1,000, Grand fathering service has been exempted under GST. Rough precious and semi-precious stones will attract GST rate of 0.25 per cent, admission to "protected monuments",

- **0.25%** - Rough industrial diamonds including unsorted rough diamonds to face 0.25% instead of 3% GST.

**2) Five Percent Tax on Goods:** Items such as fish fillet, apparel below Rs 1000, packaged food items, footwear below Rs 500, cream, skimmed milk powder, branded paneer, frozen vegetables, coffee, tea, spices, pizza bread, rusk, sabudana, kerosene, coal, medicines, stent, lifeboats, Cashew nut, Cashew nut in shell, Raisin, Ice and snow, Bio gas, Insulin, Agarbatti, Kites, Postage or revenue stamps, stamp-post marks, first-day covers, Branded food, walnuts, dried tamarind, roasted gram, Dhoopbatti, Corduroy fabric, saree foll, Paper machetes, Oil, cakes, Duty Credit Scrips, Cotton quilts (quilts not exceeding Rs 1000 per piece), corals, Rosaries and prayer beads, Hawansamagri, Grass, leaf and reed and fiber products, including mats, pouches, wallets, mangoes sliced dried, Khakra and plain chapati / roti, branded Namkeens, Ayurvedic, Unani, Siddha, Homeopathy medicines; Paper waste or scrap; Real Zari; Plastic waste, parings or scrap; Rubber waste, parings or scrap; Hard Rubber waste or scrap; Cullet or other waste or scrap of Glass; E-Waste; Biomass briquettes; Desiccated coconut, Narrow woven fabric including cotton newer [with no refund of unutilized input tax credit; Idli and dosa batter; Finished leather; chamois and composition leather; Coir cordage and ropes, jute twine, coir products; Fishing net and fishing hooks; Worn clothing; Fly ash brick; aircraft tires, puffed rice chikki, flour of potatoes, chutney power, fly sulphur recovered in refining crude and fly ash.

**Services:** All restaurants, restaurants of hotels with room tariff of less than Rs 7,500, Food parcels, Textile job work, Transport services (Railways, air transport); Supply of e-waste.

**3) twelve Percent Tax on Goods:** Apparel above Rs 1000, frozen meat products, butter, cheese, ghee, dry fruits in packaged form, animal fat, sausage, fruit juices, Bhutia, namkeen, Ayurvedic medicines, tooth powder, agarbatti, colouring books, picture books, umbrella, sewing machine, cellphones, Ketchup & Sauces, All diagnostic kits and reagents, Exercise books and note books, Spoons, forks, ladles, skimmers, cake servers, fish knives, tongs, Spectacles, corrective, Playing cards, chess board, carom board and other board games, like ludo, rubber band, Wood, stone, metals, marble idols, Table and kitchenware, Batters, including idli / dosa batter, Textile caps, sprinklers, Cotton quilts (quilts exceeding Rs 1000 per piece), Statues, statuettes, pedestals, ceramic articles, porcelain items, ornamental articles, bells, gongs, non-electric of base metal, animal carving material, synthetic filament yarn, such as nylon,

polyester, acrylic, etc; artificial filament yarn, such as viscose rayon, Cup ammonium; Sewing thread of manmade staple fibers; Yarn of manmade staple fibers; On Nov 10, 2017, these items have been shifted from 18% to 12% tax bracket: Condensed milk, Refined sugar and sugar cubes, Pasta, Curry paste, mayonnaise and salad dressings, mixed condiments and mixed seasoning, Diabetic food, Medicinal grade oxygen, Printing ink, Hand bags and shopping bags of jute and cotton, Hats (knitted or crocheted), Parts of specified agricultural, horticultural, forestry, harvesting or threshing machinery, Specified parts of sewing machine Spectacles frames, Furniture wholly made of bamboo or cane

**Services:** State-run lotteries, Non-AC hotels, business class air ticket, fertilizers, Work contracts.

2) **Eighteen Present Tax on Goods:** Most items are under this tax slab which include footwear costing more than Rs 500, Trademarks, goodwill, software, Bidi Patta, Biscuits (All categories), flavored refined sugar, pasta, cornflakes, pastries and cakes, preserved vegetables, jams, sauces, soups, ice cream, instant food mixes, mineral water, tissues, envelopes, tampons, note books, steel products, printed circuits, camera, speakers, Kajal pencil sticks, Headgear and parts thereof, Aluminum foil, Weighing Machinery [other than electric or electronic weighing machinery], Printers [other than multifunction printers], Electrical Transformer, CCTV, Optical Fiber, Bamboo furniture, Swimming pools and padding pools, Curry paste; mayonnaise and salad dressings; mixed condiments and mixed seasonings, Tractor parts, raincoats, Medical grade disposable gloves, Computer monitors(up to 20 inch),Custard powder, Rice rubber rolls for paddy de-husking machine, Kitchen gas lighters, poster Color; Modeling paste for children amusement Fittings for loose-leaf binders or files, letter clips, letter corners, paper clips, indexing tags and similar office articles, of base metal; staples in strips; aircraft engines

3) **Twenty Eight Present Tax on Goods:** In total 50 luxury and sin products will be taxed at 28% which includes Bidis, molasses, pan masala, aerated water, paint, sunscreen, wallpaper, ceramic tiles, water heater, dishwasher, weighing machine, washing machine, ATM, vending machines, vacuum cleaner, automobiles, motorcycles, aircraft for personal use

**Services:** Private-run lotteries authorized by the states, race club betting, cinema will attract tax 28 per cent tax slab under GST.

6. **Tax rate 28% become a 18% on 178 items** - Wire, cables, insulated conductors, electrical insulators, electrical plugs, switches, sockets, fuses, relays, electrical connectors ,Electrical boards, panels, consoles, cabinets etc for electric control or distribution Particle/fiber boards and ply wood. Article of wood, wooden frame, paving block ,Furniture, mattress, bedding and similar furnishing Trunk, suitcase, vanity cases, brief cases, travelling bags and other hand bags, cases ,Detergents, washing and cleaning preparations ,Liquid or cream for washing the skin, Shampoos; Hair cream, Hair dyes (natural, herbal or synthetic) and similar other goods; henna powder or paste, not mixed with any other ingredient; Pre-shave, shaving or after-shave preparations, personal deodorants, bath preparations, perfumery, cosmetic or toilet preparations, room deodorizer ,Perfumes and toilet waters ,Beauty or make-up preparations ,Fans, pumps, compressors ,Lamp and light fitting Primary cell and primary batteries ,Sanitary ware and parts thereof of all kind ,Articles of plastic, floor covering, baths, shower, sinks, washbasins, seats, sanitary ware of plastic ,Slabs of marbles and granite Goods of marble and granite such as tiles ,Ceramic tiles of all kinds ,Miscellaneous articles such as vacuum flasks, lighters, Wrist watches, clocks, watch movement, watch cases, straps, parts Article of apparel & clothing accessories of leather, guts, foreskin, artificial fur and other articles such as saddler and harness for any animal Articles of cutlery, stoves, cookers and similar non electric domestic appliances Razor and razor blades, Multi-functional printers, cartridges ,Office or desk equipment ,Door, windows and frames of aluminum. Articles of plaster such as board, sheet, Articles of cement or concrete or stone and artificial stone, Articles of asphalt or slate, Articles of mica, Ceramic flooring blocks, pipes, conduit, pipe fitting Wall paper and wall covering ,Glass of all kinds and articles thereof such as mirror, safety glass, sheets, glassware ,Electrical, electronic weighing

machinery ,Fire extinguishers and fire extinguishing charge Fork lifts, lifting and handling equipment, Bull dozers, excavators, loaders, road rollers, Earth moving and leveling machinery, Escalators, Cooling towers, pressure vessels, reactors ,Crankshaft for sewing machine, tailor's dummies, bearing housings, gears and gearing; ball or roller screws; gaskets ,Electrical apparatus for radio and television broadcasting ,Sound recording or reproducing apparatus ,Signaling, safety or traffic control equipment for transports ,Physical exercise equipment, festival and carnival equipment, swings, shooting galleries, roundabouts, gymnastic and athletic equipment All musical instruments and their parts.

**Services:** Restaurants in hotel premises having room tariff of Rs 7500 and above, telecom services, IT services, branded garments and financial services, Outdoor catering "It is a step in the right direction to reduce 18 percent from 28 percent to 178 items, and a strategy shows the GST structure and what is appropriate for customers on the basis of 'equilibrium'. This is the biggest tax revolution in India, so that theft of any type of tax will not happen. Manufacturers, vendors and customers have been brought into the tax structure. GST is a major contributor to this.

#### **GST impact on the Indian economy -**

- 1) **Direct tax collection 14% increase** - During the April-November period of the current financial year, collection of direct taxes has gone up by 14 per cent to Rs 4.8 lakh crore. According to the Central Board of Direct Taxes, collection of direct taxes has reached Rs 4.8 lakh crore in the current financial year. It is 14.4 percent more than the collection during the same period of the previous fiscal. The target for direct tax collections for the current financial year is 9.8 lakh crore rupees. Till now, the compilation is 49% of this goal. Direct taxes include personal income tax and company tax. Total collections of direct taxes (before refunding) have risen 10.7% to 5.82 lakh crores till November. In the same period, the Central Board of Direct Taxes has stated that returns of Rs 1.02 lakh crore have been given. Indirect tax collection during April-November last year increased 26.2 percent; In terms of actual tax collection, 15.12 percent increase was reported.
- 2) Now the state VAT will be shut down from April 1, 2017. The state government lost 3000 rupees after 40000 The second result is that all the states have to depend on the financially centric centers. On the contrary, the Central Government's income will be expanded further. One advantage of this tax is that the tax burden will be shared equally in the production services sector. The Finance Minister is of the opinion that people may benefit from it for some degree. But in practice it seems that private companies will only benefit from it. It is pleasure for the common man to cancel the octroi. Central sales tax, state sales tax, entry tax, license tax, turnover etc. will be canceled. The 10-20% tax which the traders had to pay will automatically be closed. As a result, it will help to increase trade.
- 3) At present, the tax is levied by the developer for service tax, VAT and stamp duty. By collecting all three taxes, the customer had to pay 9.5 to 10 percent of the total amount. However, when GST is implemented, all taxes will be deducted and there will be a single tax system other than stamp duty. Under GST, there will be 12 percent tax for the real estate sector. The stamp duty imposed by the states after GST will be 5 to 8%, which will directly lead to a home buyer. Also, any transaction will require tax to be levied on every person, hence the real estate prices will go up. CREDAI's central organization CREDAI has now been asked to cancel stamp duty on real property. Because of the GST, there will be a single tax system indirectly, but stamps will be charged from the states. Therefore, this will result directly on the customers and the resultant developers.
- 4) **Railway travel will be expensive** - The goods and services tax (GST) will be implemented from 1 July and the GST will have to get rid of rail passengers. With GST, the service tax on first class and first class tickets will be increased from 4.5% to 5%. So passengers and passengers will have to pay more for AC and comfortable travel. The service tax is levied on the air-conditioned classes ie AC

coach and first-class tickets on the Railways. Service tax will be increased by half percent by GST. Previously, service tax was 4.5 percent. If GST is implemented, it will increase by 50 basis points. If the ticket price is Rs 2,000, then the traveler will have to pay Rs 2,010 from next month, a senior Railway official said. Railways have appointed a nodal officer in each state for the implementation of GST. Officials say that with the railway tickets, the catering service of the train will also affect GST.

- 5) **Sports sector receives inflation** - Due to the inclusion of goods and services, the sports sector is being considered for inflation. The Maharashtra Sports and Fitness Trade Association is worried that GST will increase sports prices by up to 2 to 5 times. According to Indian business classification, section 9 of sports material is included. The practice includes gymnastics, outdoor games, which include physical fitness. According to GST, 28 percent tax on these sports items will be taxed. Therefore, the price of sports goods will increase.
- 6) The Goods and Services Tax (GST) rate of 12 percent will be applicable on under-construction properties. This rate with input tax credit seeks to remove the inefficiencies of dual taxation in the form of value-added taxation (VAT), service tax and puts an end to multiple taxes.
- 7) Finance Minister Arun Jaitley on Tuesday released the country's maiden GST revenue data that surpassed government's internal expectation of Rs 91,000 crore revenue and recorded tax collection of Rs 92,283 crore from just 64.42 percent of the total taxpayer base. These tax collections are for July and the numbers are likely to go up when all the taxpayers file returns.

**SYSTEM SOFTWARE ANALYSIS & MODELING OF FOREIGN TRADE OF INDIA 1949 – 2015**

**Prof. Dr. Vijay Kumar Adwant**

R/o. 2-1-474/9, Anand Apartments, Street No; 07, Opp. Post Office, O.U. Road, Nallakunta, Hyderabad 500 044, Telangana State

**I: Introduction:**

**I. “Foreign Trade System Analysis of India” 1949 – 2015.**

I. MIS – Management Information System / DBMS & MIS

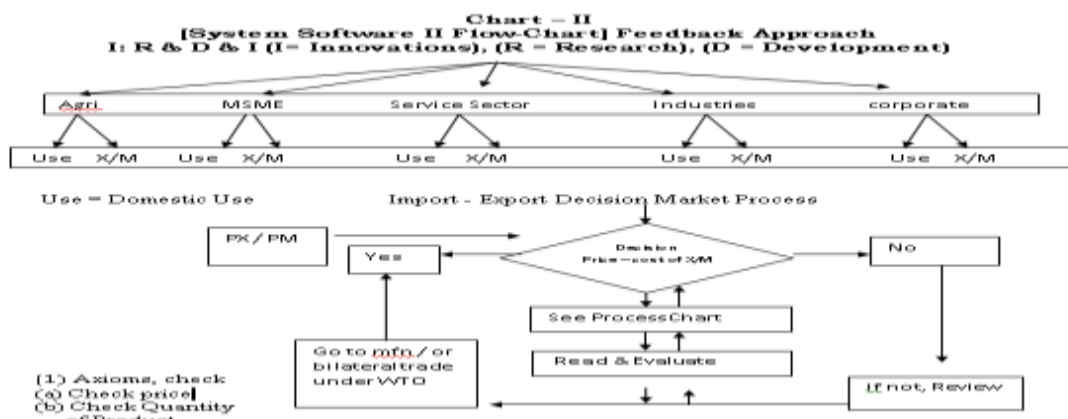

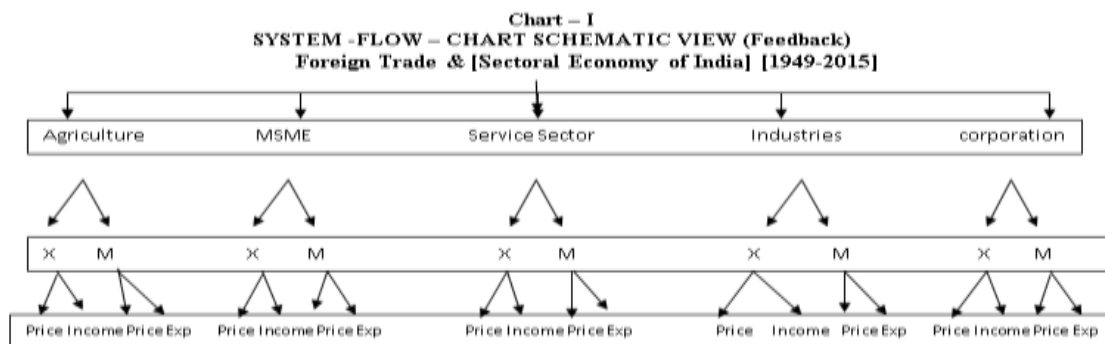

II. Banking, Postal and Insurance, Net Working, visiting various portals, sights and locations

**II. Internal Terms of Trade Factors and Rationalization of Water Management System in India (2014 onwards).**

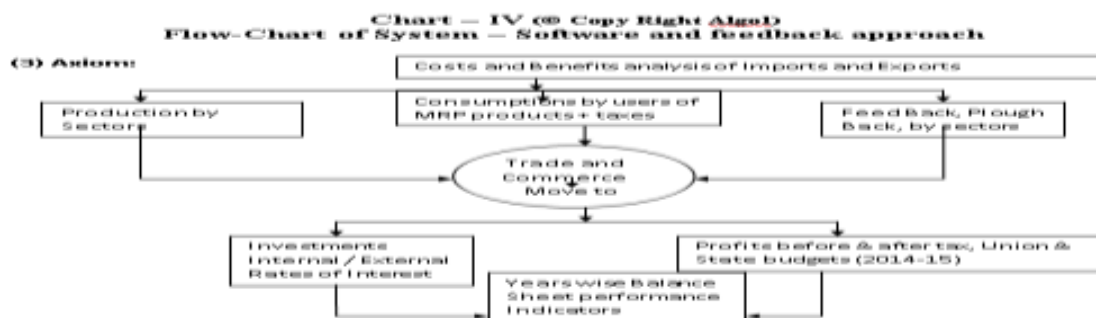

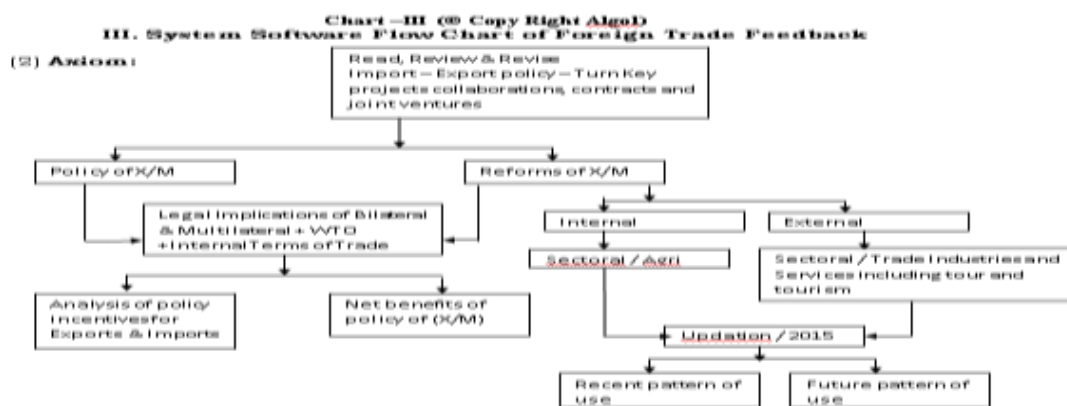

I. Challenges in Agriculture productivity, and Failure of Khariff and Rabbi Crops mostly in Southern States of India.

II. Variations in Rainfall indices and its effect on net crop sown area with losses in crops leading to farmers suicides in India from UPA I & UPA II & NDA with (14 Months) Rule, especially in Telangana, AP, Marath Wada, Vidhraba, Karnataka, MP and other states of India.

III. Linking of Rivers experiment in residuary AP (Krishna & Godavari) on partial fulfillment of K.L. Rao’s plan.

**III. Testing of Hypothesis:**

H<sub>0</sub>: MIS: Encourage changes in R & D, innovations in sectoral economics of India with data base acquisition techniques. It follows gain from trade.

H<sub>1</sub>: IT: Information Technology is exogenous and supplementary to MIS approach by cost and benefit analysis [Study by Turvey & Turvey]; criterion of Min Cost Vs Max Revenue. [Minima & Maxima Analysis] for welfare of masses

- I. Objective of this paper is to analyze MIS Vs IT
- II. IT must explore comparative advantage in trade practices of imports and exports by price competitiveness. Science and Technology set up in Social Frame work (2010 – 2015) is likely to have positive impact on India’s economic growth above 50%in real term. In feasibility analysis, it is better to define feasible sets of Information Technology, having permeation and percolation standards for social clause and its relative benefits.
- III. Stock – Flow Model of input – output approach for Foreign ,Trade of India 1949-50 to 2014-15 (Ratio – Analysis of Cost / Price) of exports/imports variables being replaced by imports cost / price – considerations.

**Causality & Reasoning (If, Then Rules, KBS = Knowledge Based System)**

**IV. Ratio – Analysis: Volume of Exports to Volume of Imports:**

1. Relative Export – Import price or cost. ➔ I. Reverse Ratios
2. Relative Import – Export price or cost.
3. Relative quantity of imports or relative quantity of exports or Vice Versa ➔ II Reverse Ratio
4. Relative income/Expenditure of Exports and Imports.
5. Relative Expenditure or income imports and exports. ➔ III. Reverse Ratios

I, II & III Reverse Ratios are used for causal factors; growth rates of double log followed by their respective elasticity’s.

- I. Compound Growth rates; Import to Export Relative of (Price & Expenditure) Vs Relative (Price & Income) in relation to quantity of imports to exports Vs exports to imports and Vice – Versa. [Causal – Ratios]
  - II. Reverse ratio X/M & M/X for (Relative Price & Income that is Export income & also for Income and expenditure for Elasticity, which also relates to import expenditure and export income.
  - III. If X = M (Equilibrium in BOP)  
If X < M (Deficit in BOP)  
If X > M (Surplus in BOP)
- Current and Capital account for analyzing FOB, CIF & TOT (Terms of Trade)
- # Causal factors of import substitution and a case
- IV. Data Analysis (trends in Imports & Exports of India) (1) 1950, (2) 1955, (3) 1960, (4) 1965, (5) 1970, (6) 1975, (7) 1980, (8) 1985, (9) 1990, (10) 1995, (11) 2000, (12) 2005, (13) 2010 & (14) 2015, after this computation for secular trends of 64 years and 64.6 years, shown in estimates tables.

1.  $t$  for  $\hat{b}, \hat{c} ] y = a + \hat{b} x$
2.  $y = a + \hat{b} m$
3.  $y = a + \hat{c} x$  Export
4.  $y = a + (\hat{c}^{\wedge}) m$  Import

Estimates of  $\hat{b}$  & in ratio or simple regression analysis and by components of DLG growth and Elasticities

# Ratio analysis and factor reversal tests for X/M or M/X to study causal factors, reasoning and associations.

#### Tests of Significance 't' = F

Test of significance for estimate of log b and anti log of the same (b) for 64 years and 64.6 years is not shown for above tests in this study but, one can attempt significance of double log growth and elasticity of Import and Export including its Vice Versa for aggregate import expenditure verses aggregate export income; showing throughout for deficits in the balance of payments for the period 1949-50 to 2013-14 and 1949-50 to 2014-15 for a period of 64 years and 64.6 years, except for 1 or 2 years, which is, negligible, in overall negative balance of payments on current and capital accounts of India's Foreign Trade. Estimates of elasticity in double log form in terms of ratio of export income to import expenditure is a reversible factor for analyzing causal effect of marginal and total changes in elasticity of Imports and Exports of India for secular trend of 64 years and 64.6 years. It can be rechecked by year to year changes in overall changes in export income of India and import expenditure in terms of Rupee Trade versus US Dollar Trade expressed in Crores of Rupees and million US Dollars as seen from the Economy Survey of India for the year 2014-15, The Union Ministry of Finance and Department Economics Affairs, Statement No. A84, A85 Table 7.1(A) and A86, A87 Table 7.1(B), for aggregate exports and imports for the above stated periods. Oxford University Press, New Delhi 110 001.

To check  $t^2 = F$  Tests: Analysis of Variance and Covariance.

$$(1) \text{ 't' test for } b = \frac{\hat{b}}{Se \text{ of } (b)}$$

$$(2) \text{ 't' for } b_1 = \frac{\hat{b}_1}{Se \text{ of } (b_1)}$$

$$(3) \sigma_y = \frac{\sqrt{\sum Y^2}}{n} \text{ and } Y - \bar{Y} = y$$

$$\sigma_x = \frac{\sqrt{\sum X^2}}{n} \text{ and } X - \bar{X}$$

**Table I Estimation****EXPORT capacity to Finance Inputs of India 1949-50 to 2014-15****Double Log Growth Pattern**

S. no	1949-50 to – 2013-14	N = 64 years	X/M Rupee Trade %	X/M US million dollar %
1	Rs Trade	64	$13.8/14.0 \times 100 = 98.57\%$	$9.37/9.57 \times 100 = 97.91\%$
2	1949-50 2014-15 Upto 6 months of this current year	64.6	$13.22/13.46 \times 100 = 98.21\%$	$8.24/9.07 \times 100 = 90.84\%$
3	US million \$ Trade		98.21%	90.84%

# (All Computation based on ORPATfx-100D, Super-FX, which is a format for next system software work of the proposed version Window 10, therefore, feedback is necessary in this regard).

Rupee Trade, Degrees of variability in Rupee term varies from the above table no.1= 98.21% to 98.57% = - 0.36%. (1949-50 to 2013-14); N = 64, and specifically for N = 64.6 years = 98.21% (1949 – 50 to 2014-15). The difference (98.57 – 98.21) = - 0.36%.

In US Million Dollar Trade, the degrees of variability from the above table no.1 varies from = 97.91% - 90.84% = - 7.07%. (1949-50 to 2013-14); N= 64

$$(90.84 - 97.91) = -7.07\%.$$

It shows that the value of US Dollar is dearer to Rupee Trade of India, so, is the case of Euro dollar and UK Pound. The rate of exchange value of Rupee is found to be weaker in daily exchange rate of Mechanism. 1 US dollar = Rs. 64.82, 1 Euro = Rs. 74.09, 1 UK Pound = Rs. 100.26, based on Exchange Rate of Currency of Rupee to US Dollar, Euro and UK Pound.

**Source:** Deccan Chronicle, Business, Friday 16<sup>th</sup> October, 2015, Hyderabad, P. 21.

Procedure of Estimation, Component Analysis of Double Log Growth and Elasticity Gradient based on Supply and Demand Functions of Imports Exports of India or Exports and Imports of India in ratio analysis for studying causal effects along with measures of variability for 64years and 64.6 years.

$(\log y - \log x) = \log b = \frac{\log b}{n} = \text{Estimate of } \hat{b}$ ; Anti log of  $\log b - 1 = \text{Gradient or Elasticity}$ , then  $(\hat{b} - 1) \times 100 = \text{Double Log Growth of Exports to Finance Imports by ratio analysis and reversion of ratios in Table II, Estimation (X/M to M/X), the ratio for causality based Keynesian Model } y = f(x) \text{ conversely } x = f(y).$

**Model, Component Analysis of Simple Regression.**

Based on the Keynesian type of income consumption model of closed economy replacing variables of Foreign Trade of India, for its Exports and Imports from the period of 1949-50 to 2014-15.

**I. System Software and Hardware Compatibility of Exports and Imports of India 1949-2015. Line Sequential and Parallel Processing and Time Sharing Mechanism related to Internet and System Software.**

Demand and Supply Linear Functions of Exports and Imports with reverse ratios.

**Aggregate Exports – Imports & Trade Balance of India of 1959-50 to 2014-15 (06 months period) of Trade where N = 64.6 years and N = 64 year for 1949-50 to 2013-14**

		Rupee Trade value in Crores	Ratio	Actual value in %
1949-50 To 2013-14 N = 64 Years	(Export) X	13.80%	0.9857	0.98X100= 98.57
	(Import) M	14.00%		

Trade Balance		-5.90 – 2.20 Log value -8.0029	-8.1 Log B ratio divided by N anti log of lob b = 64 years	ANTI LOG OF LOG B -1 x 100 = 1.22089 – 1 = 0.25089 X 100 = -25.089%.
1949-50 TO 2014-15, N = 6 months 64.5	(Export) X	13.22%	0.9821	0.9821 X 100 = 98.21
	(Import) M	13.46%		Anti log of $\hat{b}$ = (1.3372-1)
Trade Balance	Trade Balances are negative throughout 64 years except for 1 or 2 year, which is of very low surplus value of exports and found to be negligible	-5.908 - 2.120 = Log value -8.028	Log b/N -8.028	Anti log of $\hat{b}$ = 1.3372-1) = 0.3372 X 100 = - 33.72%
		<b>US Million Dollar Trade: growth of exports to imports</b>	<b>Ratio</b>	<b>Actual value in %</b>
1949-50 to 2013- 14	(Export) X	9.37%	0.979 X 100	97.91%
	(Import)M	9.57%		
1949 – 50 to 2013-14 N = 64 yrs	Trade Balances are negative throughout 64 years except for 1 or 2 year which is of very low component	-5.132 -2.440 = -7.573 / 64 = - (0.118) anti log of b = - (1.313 – 1 = 0.313)	- (0.313 X 100) B-1 0.313 X 100 = -31.3%	-31.3%
1949-50 to 2014- 15 N = 64.6 yrs	(Export) X	8.84%	0.975 X 100	97.57%
	(Import) M	9.06%		
1949-50 to 2014- 15 N = 64.6 yrs	Trade Balance	-5.041 - -2.440 = - 7.4825 / 64.6 = -0.1158 Anti log 1.3055 – 1 = - 0.3055	- 0.3055 X 100	-30.55%

**#NOTE:** Pickup rate of 2016-17 can be taken into consideration for improving export capacity to finance import, but, due to monetary distortions in Indian Economy with failure of crops resulted in price rise of pulses, Onion and many other essential commodities. There is a decrease in net sown area followed by farmer's suicides having larger debts. This problem is persisting from UPA 1 and 2 along with new NDA Government for last 14 months. There are several leakages in public distribution of Rice, Wheat, Kerosene, Onion and irregularities in irrigation schemes. All these factors constitute negativity in balance of payment and internal and external terms of trade of India.

**Rupee Terms of Trade of India from 1949-50 to 2013-14 & 2014-15, N= 64 years & 64.6 years.**

The above estimates are proxies for Exports to finance Imports for 64 years (1949-50 to 2013-14) 98.57% for double log ratio of export income to import expenditure 98.57% being closer to 98.21% for 64.6 months for the period 1949-50 to 2014-15 the difference in ( - 0.36%, in case of trade balance the ratio differs from – 25.089% in 1949-50 to 2013-14 to – 33.72% for the period 1949-50 to 2014-15. This variation is attributed to international changes in trade pattern of Internal Trade Distortions related to Food Security and leakages along with minimum support price have been reported among 29 states of India. Which is a serious problem in internal terms of trade especially Onion and Pulses, where the prices continue to rise due to increase in prices of Diesel and Petroleum in International Market. The terms of Trade in difference in US million \$ = -25.089 – 33.72 = - 8.63%.

#### **India's Foreign Trade in US Million Dollars for 64 years and 64.6 years for the above period.**

- 1) Variation in Export capacity to finance its Imports for the year 1949-50 to 2013-2014 was 97.91%. It decreased to the extent of 97.57%, for the period 1949-50 to 2014-15. The marginal decrease in double log form of Export Import of India the difference is various from to (97.91% - 97.57%) = - 0.34%
- 2) In balance of payment analysis for Export FOB and Import CIF, the deficit in terms of trade being negative for most of the periods excluding for few years, tend to show marginal declined from - 31.3% in double log form for the period 1949-50 to 2013-14 and then, -30.55% for the period 1949-50 to 2014-15, the marginal difference is – (31.3% - 30.55% = -0.75%). This secular trend in trade balances for 64 years and 64.6 years in US million dollars refer to trade distortions in India's Trade Balances but, there is shock – absorber effect between Rupee and US Million Dollar Trade. Even with the Chinese devaluation of Yuan, the structural parameters of India are stronger which has been proved by improvement in stock exchanges of India, especially, Bombay Stock Exchange.

#### **Conclusion:**

- 1) Trade distortions in Internal Terms of Trade to be minimized when it comes to leakages in food distribution system of India. This criticism is based on Economic Survey of India (2014-13) Vol I & Vol II, chapter 3, related to agricultural produce market committee act and page no 55 on price subsidies (minimum support price) page no 56 leakages an effectiveness of product subsidies, PDS allocations and leakages page no. 57 estimations on page no. 58 (The poor consume only 46% of subsidized Kerosene) discussion on page no. 59, page no. 60, 61 & 62 statements of the table no. 3.4, 3.5 & 3.6, the estimates of Food on page no. 63, followed by leakages in MGNREGA with Jan Dhan Yojana, Aadhar and Mobile. These issues became prominent in Chhattisgarh, Madhya Pradesh, Haryana and Punjab for rice and wheat including linkages in North East Region of India. It is necessary to remove distortions in public distribution system of rice, wheat, sugar, cotton, Kerosene and other essentials. Regulations of PDS (Public Distribution System) among 29 states of India is very important when it comes to minimum support price and subsidies for various goods and services. (Economic Survey 2014-15, Volume – I & II, Oxford University Press, Government of India, Ministry of Finance, Department of Economics Affairs, Economic Division February 2015).
- 2) Terms of Trade effect of Foreign Trade of India is negative for BOP = Balance of Payments on Current Account of Export FOB and Import CIF, in Rupee as well as US Dollar. WTO agreements in bilateral trade are preferred in lieu of MFN status (Most Favored Nation). Tariff negotiation under WTO can bring desirable changes in Foreign Trade Policy of India in relation to China, USA, France, Germany, UK, Japan and many other bilateral trading partners of India. Anti dumping policy is being criticized for China's way of dumping instead of price competitiveness.
- 3) The composition of trade also play an important role when it comes to agricultural exports verses exports of non agricultural goods and services of Engineering, Electronics related to turn key projects placed outside India. This is based on MIS and IT.

*Mr. Vijayakumar Jadhav (31-36)*

## **THE INS & OUTS OF IN FILM BRANDING IN INDIA**

**Mr. Vijayakumar Jadhav**

*Government first grade college Sindagi, Bijapur Karnataka India*

### **Introduction**

In film branding is said to be as an advertising technique used by companies to promote their products through a nontraditional advertising technique usually through appearances in films.

Today, directors and story writers become quite creative and imaginative as far as in film promotion is concerned. Not only in story lines, but brand names appear in lyrics and movie titles as well. Sometimes branding is done in an indirect manner by displaying logo or hoardings in the background. Sometimes, the branding is quite obvious and direct where movie characters endorse the brands openly, Advertising products through a film was primarily known as In film branding and this kind of exercise is known in variety of names such as “brand placement”, brand integration, brand entertainment, in-film advertising, product placement and recently as brand cameo or embedded marketing

Films are shot with special product-placed within films in association with lead actors or actresses in various important situations. Indian consumers are having a tendency to follow their dream heroes or heroines. Indian fashion market follows the trend set by Hindi film actors and actresses. In spite of this, Indian product placement industry is not as successful as the Hollywood. Product placements are on a meteoric rise in Hollywood. Greater numbers of advertisers are looking for alternatives to traditional advertising avenues, in search of more effective ways to reach an ever elusive audience. Producers’ desire to achieve realism on screen and the need for alternative sources of funding are further feeding the exponential growth of product placements and branded entertainment.

There are hundreds of Media agencies in that offer creative and effective ways of brand endorsement through movies and serials. There are experts who use their imagination to integrate products into the script. There are advertising agencies that does the best advertising ideas for their clients. Content integration is the upcoming trend. Utmost care is taken that brands appear in a natural way and do not become a hindrance to the natural flow, and these agencies take care that a product which placed in movie should not affect the script of the film.

In film branding in Indian movies

In film branding placement, which has become an established marketing tactic due to its clear effectiveness in building brand recall and recognition, is not just for Hollywood. Hollywood’s “big players” In film branding also play in Bollywood. Coca Cola in India, for instance, has benefited from placement in movies along with a celebrity endorsement with Bollywood movie star Amir Khan and won Pepsi for its market share. (Business Week, February 2003) McDonalds has also been quite active in Bollywood in “In film branding”. In “Love Ke Liye Kuch Bhi Kareja” the

Coca-Cola was ahead of the game even in Bollywood movies. In a scene from the film Shree 420 (1955) when Raj Kapoor, the protagonist, enters Mumbai for the first time, a large Coca-Cola banner was visible right above his head In the movie, An Evening in Paris (1967), Coca-Cola was featured more than once. Rajdoot motorcycle was featured in Raj Kapoor’s Bobby (1975).

Hrithik Roshan tells Preity Zinta’s family to have Bournvita everyday in the movie ‘Koi Mil Gaya’. But when there are over 25 brands placed in ‘strategic’ frames in a single movie, as was seen in ‘Ra.One’, as both movies main audiene were kids they endorsed the brands which are

related to kids. Then there are examples of movies such as 'Zindagi Na Milegi Dobara', which led to a mini boom in Spanish tourism, thanks to the extensive coverage of Spanish locales in the entire movie. 'Cocktail' and 'Ek Tha Tiger', have also given wide visibility to brands through strategic placements

In PK, "All brands managed to establish a great recall and the film becoming the highest grossing film has added further sheen to the association." For instance, two songs were picturised with Anushka riding Hero cycles in the film. Similarly, placing Cycle agarbattis made sense as incense sticks are used during prayer. In addition, Duracell battery was well integrated in the film sequence.

The brand Amul which was associated with the biopic Bhaag Milkha Bhaag. The brand leveraged the fact that Milkha Singh ran his first cross-country race after he joined the Army to get a glass of milk in the biopic Bhaag Milkha Bhaag.

#### Background

If advertising refers to a message that helps to inform or influence consumers, and content refers to entertainment, what happens when you mix the two the question gets answer by the time the impact is higher and the benefits of the content maker multiply, simply because viewers can't ignore advertising imbibed in the content.

In film branding in Indian movies is not something new. A discernible trend as regards using storyline of the film to advertise products has been noticed in the recent past. The products chosen for advertising through this medium have varied from automobiles to soft drinks, garments, gift items, services, pharmaceuticals to name a few. This industry was an unorganized sector; it was granted "industry status" only in the year 2000 by the Government of India. Thereafter began the journey towards its formation as an organized sector

Brands have realized that movies are a great way to reach out to an audience which is captive for a few hours. However, this is not a new occurrence. Hollywood started the trend of product placement much earlier than Bollywood. The earliest entry to tread this path was Wings, a silent feature film released in 1927. It featured a product placement for Hershey's chocolate, The Z3 made a prominent appearance in the James Bond film Golden Eye, most of the James Bond movies endorse one or another product.

Over the years Bollywood has not only surprised us with its movies and songs but also with its subtle and not so subtle product placements. Brands never leave a chance of reaching out to its target audience. And in a country where films are given such importance and has a huge fan following, it seems like films are considered as an ideal platform to showcase their product and capture the attention of the audience with their favorite celebrity using the product. The creativity goes in placing the product in a manner where it feels like a part of the story and is connected with the characters.

You can promote the association with a film by generating internal and external promotional campaigns keyed to that movie. In-film branding inside commercial films is a highly cost-effective way to gain huge exposure and visibility at a fraction of the traditional advertising costs. The first recognized product placement in Hindi film is "Coke" in Subhash Ghai's "Taal". In order to promote Stroh's Beer, actor Shahrukh Khan mentions its name in the movie "Dilwale Dulhania le Jayenge" for a 15-second slot. Salman Khan starrer movie Sultan endorsed CP Plus a cc tv camera company, Automobiles are among the more favorite products for placement in films as is evident from the movie BMW motorcycles in Dhoom-3, Mahindra Scooters in 3 Idiots, Castrol in Tara Rum Pum,

In film branding is a marketing plan which will be used by an advertiser to place his product/In film brandings in a movie. The companies will generally be interested in placing its brand rather than a particular product in movies. For example, when Coca-Cola advertises, it emphasizes that

as a brand and not as any other soft drink. Generally the Indian film portrays the culture of the state, products and practices endorsed by the regional stars or iconic brands that can have an impact on the movie goers.

An increase in multiplex theatres in the country and subsequently increased the audience strength moving to theatres. Compared to Hollywood movies, the brands can get longer visibility in Indian films. The popular brand placement studies measure the degree of efficiency of product placements on the basis of the remembrance of the brand.

A study conducted in USA in the year 1993 reveals that participants between the age group 18-34 were significantly positive with respect to brand placement and the preference for such placements were positive than that of other types of television advertisements.

Possible Ways to do In film branding.

- Active /indirect placement

In this method, the character of the movie in a situation would be openly agreeing that he/she is using a particular brand. For Example, Farhaan Akhtar using Royal Enfield in Bhaag Milkha Bhag even Katrina rides royal Enfield in *zindagi na milegi dobara* movie.

- Spoken placement

In this type, the star/main character of the movie would recommend the product to his peer/friends. For example in movie *dabang* a song lyrics were featured a brand called fevicol and in movie *sultan* ranndeeep hooda points at CP Plus camera and says company's tagline.

- Usage placement

In this type, the product, logo or the service can be perceived for a few minutes or seconds in the movie and it may not have any relationship with the plot of the movie. For example *Golmaal 4* used Being human bicycles, in *3 idiot's* movie, you see Kareena Kapoor riding on Mahindra flyte (fig 2), With very clever and subtle product placement, in movie *krishh* Bournvita can be seen consumed by the character Krishna played by Hritik in the movie and who doesn't follow a superhero? Kids were an easy target for the brand through such product placement and benefited the brand a lot. Lays also joined the race as Priyanka Chopra can be seen consuming it quite a few times in the movie.

- Hyperactive product placement

It's when the actor is not only using the product but also telling its benefits or recommending the product in the movie. A very good example of this is Shahrukh Khan in his movie *Chennai Express* where he takes a minute or two to innumerate the benefits of Nokia Lumia smart phone.

- Passive / visual In film branding

Passive product placement is when the product or brand is integrated in the background In this type, the product, logo or the service can be perceived for a few minutes or seconds in the movie and it may not have any relationship with the plot of the movie. For example, in *two states*, Alia Bhatt got her placement with Sunsilk and in *Dostana*, Priyanka Chopra worked for Verve Magazine, akshay khanna starrer *hungama* movie, endorses brand Videocon. aaptarakshak a kannada movie starring Dr. vishnuvardhan featured VASU agarbatthis.

- Product as the part of the story (theme)

Brand placement is one thing and making a whole film that revolves around the product is a boon for the brand. The film '*Mere Dad ki Maruti*' is based on a story where the '*Maruti Ertiga*' was launched through such a creative and amazing product placement. The film spoke about was the brand woven into a story is a genius idea to reach your target audience

Sometimes the story is woven around a specific product or product category. This is extreme level of In film branding. However, this trend is not very well developed in India. Very few films have adopted this type of In film branding placement. For instance, In movie *Dhoom high*

speed bikes are the part of the story, mere dad ki maruti where ertiga was the central part of the story (figure 8)

- Product in promos

This the relatively new trend where the product is tied up with the promo of the movie. The trend in India was started with Kaante where thumps up is associated with promo, similar example is of movie kick was associated with Suzuki gixxer. However it is more seen in the television programs especially the reality show

Reasons of In film branding

- To achieve prominent audience exposure, visibility, attention, and interest Product placements can have a significant effect on message receptivity.
- To increase brand awareness
- To increase consumer memory and recall of the brand or product
- To create instant recognition of the product/brand in the media vehicle and at the point of purchase
- To bring desired change in consumers' attitudes or overall evaluations of the brand
- To bring a change in the audiences' purchase behaviors and intent
- To create favorable practitioners' views on brand placement
- To promote consumers' attitudes towards the practice of brand placement and the various In film branding vehicles
- In film branding placement is to utilize the emotional values through transferring the image of the end user to the consumer.

Benefits

Benefit of product placement in movies is that cannot be ignored or skipped by the audience, it registers in the audience mind (if the product or brand is noticed by the audience) and it links the celebrity brand image and value to the product that they are portrayed using. It does not appear like an advertisement whose aim is to lure customers and push them for sales. So movies definitely have a greater audience reach and so are the product placements in such movies.

- I. Value addition for film makers
  - Cutting down huge cost
  - Earn profit
  - Free Promotion
  - Continuous reminder
  - Conducive support to even new film-makers
  - Zero costs and multifold benefits
- II. Value addition for brands
  - Mark on the market
  - Short process time
  - Target audience is easily reached
  - effective In film branding placement
  - Cheap advertisement cost
- III. Efficient placement of products ensures that the audience will notice the products. Audiences have no option but to notice.
- IV. Products when they are embedded in a film/television script. Cost of product placement is quite low.
- V. Compared to the above-the-line methods of advertising or endorsement, unlike advertising, In film branding does not interrupt programming and hence is less obtrusive.

- Products gain greater credibility when popular and respected movie and television stars use them.
- VI. Build national recognition: the product is made aware of its existence to the mass market.
- VII. Enhance your corporate image: The Company's corporate image is recognized internationally due to their products awareness among the mass market. Promote your brand with some of today's most successful films and TV programs. Brands like Coca Cola and Pepsi associate themselves with films like Baghban.
- VIII. Associate a brand with an implied celebrity endorsement: Most companies try to have their brands endorsed with a celebrity or well known actor; this gives the product much hype.
- IX. Longer shelf life: Films have a long life even after their release. Long after their release in movie theatres they are available on prime time television channels; pay for view, cable television channels, Inexpensive marketing practice: Product placement is less expensive than traditional advertising

Effective In film branding can be done by following these ways

- If A product being used by characters in the movie is better than simply advertising the product in the movie.
- The products may be promoted by being used by other important cast members in the movie and not necessarily the lead actors.
- Audiences want to identify themselves with certain movies and characters, hence "lifestyle" products benefit more from In film branding placements rather than daily-use products.
- The target audience should be aware of the product that is being placed in a movie. If this is not the case, the placement, is rendered useless.
- People have good brand recall of products/brands seen in movies, thus this form of advertising creates awareness amongst the people.

Research also highlights that it is very important to very carefully place the product within the storyline or it may become out of place and thus attract negative attitude from the target audience. It has been observed by several researchers that smaller brands benefit more from effective placements as compared to bigger brands

Conclusion:

Majority of audience accepts the In film branding practice in films. Higher brand recognition and recall levels pave the way for other marketing communications to enhance the actual brand attitude, thus confirming the need for integrated marketing

There are certain risk and limitation with In film branding, if the movie is hit then the visibility is more, though if the movie is a flop the reach and visibility of movie is decreased and the effectiveness of in film branding is diminished. Also pricing is difficult as predicting the movie success is not possible in advance. There are also ethical issues associated with product placement in movies like such promotions entails subliminal or subconscious promotional aspects and might affect consumer preference without their conscious knowledge.

In film branding is a growing field In film branding has withstood the test of time by continuously demonstrating its capabilities to marketers. The once threat to advertisers has become a viable venue, providing new and better ways to do business with clients. The evolution of In film branding placement will flourish as informed advertisers and marketers capitalize on the right entertainment property with the right cross-marketing programs. In film branding placement in Indian movies is also quite old. Brands and popular Indian cinema have aligned quite famously, and the trend of in-film advertising is gaining ground as both producers and

advertisers see long-term benefits. Put together, the analyses suggests that this strategy can be developed into a very effective tool for advertising the products if In film branding placements are planned in a creative, innovative and enjoyable manner.

## **MODERN TRENDS IN MANAGEMENT & COMMERCE**

**Prof. Dr. Girishkumar N. Rana**

*Associate Professor, J.Z.Shah Arts & H.P.Desai Commerce College; Amroli-Surat(Guj.)*

**INTRODUCTION:** Due to continued technological innovations, the world had seen drastic changes in almost every sphere of life. The advent of Internet-based electronic commerce over the past decade or so has given businesses an unprecedented marketing opportunity. Brick and mortar businesses can find it difficult to compete with web-based businesses because the latter usually have lower operating costs and greater flexibility ([www.investopedia.com](http://www.investopedia.com); 2011). As the Internet-using population has grown, so too has the potential market size for any business that sets up a shop on the Web (Steinfeld, C.; 2002). With the advent of each new day, new technologies were developed in the wake to make life easier. This development resulted in the transformation of the world from e-commerce to m-commerce. The reasons for these developments can be traced back mainly to technology innovations, like faster data transmission technologies and better mobile devices equipped with improved computing capacity, enhanced data storage and better user-interface. Some other factors, like the increasing penetration of society by mobile phones and the integration of world economies have also increased the need for mobility. The high availability of mobile Introduction phones, which is greater than that of computers in most countries, is leading to concepts of new, innovative mobile services, collectively described as m-commerce.

**TRADITIONAL COMMERCE:** Traditional commerce can broadly be defined as the exchange of valuable objects or services between at least two parties. Such activity includes all of the processes that each party undertakes to complete the transaction. The earliest form of traditional commerce is the barter system. A traditional "street-side" business that deals with its customers face-to-face in an office or store that the business owns or rents. Henceforth, all the components in traditional commerce are physical.

The activities which most businesses engage in as they conduct commerce are called business processes. Classic business processes include:

- transferring money and information
- placing of orders for products
- sending of invoices to consumers
- delivery of goods. ([www.londoninternational.ac.uk](http://www.londoninternational.ac.uk), 2011)
- In short, traditional commerce means communicating (ordering, paying) with customer and supplier using different applications in many time-consuming different steps ([www.thalys.gr](http://www.thalys.gr), 2011).

**E-COMMERCE:** Commerce has a long tradition of profiting from innovative systems and tools. As technologies emerge, successful businesses are quick to identify developing opportunities and expand their commercial capabilities. Conducting commerce electronically is no different. For many businesses, new technologies that digitally exchange text and monetary information are effective tools to serve traditional business goals of streamlining services, developing new markets, and creating innovative business opportunities. In addition, they offer the potential to develop types of services that are so innovative and distinct from tradition that they define a new type of commerce. Appropriately named, electronic commerce (E-Commerce) is the synthesis of traditional business practices with computer, information and communication technologies. ([www.orlandowebdevelopment.com](http://www.orlandowebdevelopment.com), 2011) Although there are many definitions and explanations of e-commerce, the following definition provides a clear distinction.

- Electronic commerce, or e-commerce, is defined to be the process of businesses trading with other businesses and the formulation of internal processes using electronic links.
  - Electronic business, or e-business, is a term often used interchangeably with e-commerce, but is more concerned with the transformation of key business processes through the use of internet technologies.
- In addition to this, a more generic definition of electronic commerce would include electronic funds transfers used by many banks as well as business to business communications using the internet, extranet and intranet networks. ([www.londoninternational.ac.uk](http://www.londoninternational.ac.uk), 2011)

From the analysis of the definition, we may put that E-Commerce is a confluence of business operations with electronic and network technologies. Telephony and non-networked technologies such as CD-ROM media may integrate into operations, but the core of E-Commerce is network technologies and especially open networks such as the Internet ([www.orlandowebdevelopment.com](http://www.orlandowebdevelopment.com), 2011). E-commerce means processing of information using one digital application (EDI or Internet) and only a few quick steps. ([www.thalys.gr](http://www.thalys.gr), 2011) Ecommerce has allowed firms to establish a market presence, or to enhance an already larger market position, by allowing for a cheaper and more efficient distribution chain for their products or services. One example of a firm having successfully used ecommerce is Borders. This book store not only has physical stores, but also has an online store where the customer can buy books, CDs and DVDs. ([www.investopedia.com](http://www.investopedia.com); 2011). E-commerce is a very valuable weapon. Its most important characteristic is interactivity which keeps the customer involved in the company's processes. Interactivity is the mean to individualization. Furthermore, it is cheap as long as you use Internet or reform already installed EDI (Electronic Data Interchange). Note that installing EDI from the beginning is much more expensive than using the web. ([www.thalys.gr](http://www.thalys.gr), 2011) There had always been illusion as to the concepts of e-commerce and e-business. While some use e-commerce and e-business interchangeably, they are distinct concepts. In e-commerce, information and communications technology (ICT) is used in inter-business or inter-organizational transactions (transactions between and among firms/organizations) and in business-to-consumer transactions (transactions between firms/organizations and individuals). (Andam, Z.R.; 2003)

From this discussion we may conclude that an e-business model must have following essentials:

1. A shared digital business infrastructure, including digital production and distribution technologies (broadband/wireless networks, content creation technologies and information management systems), which will allow business participants to create and utilize network economies of scale and scope;
2. A sophisticated model for operations, including integrated value chains-both supply chains and buy chains;
3. An e-business management model, consisting of business teams and/or partnerships; and
4. Policy, regulatory and social systems-i.e., business policies consistent with e-commerce laws, teleworking/virtual work, distance learning, incentive schemes, among others. (Andam, Z.R.; 2003)

#### **Types of E-Commerce:**

Some of the major types of e-commerce include the following:

business-to-business (B2B);  
business-to-consumer (B2C);  
business-to-government (B2G);  
consumer-to-consumer (C2C);and  
mobile commerce (m-commerce).

**B2B E-Commerce:** B2B e-commerce is simply defined as e-commerce between companies and involves companies conducting e-procurement, supply chain management, network alliances, and negotiating purchase transactions over the internet. Businesses use e-commerce to lower transaction costs of conducting business and to make savings in terms of time and effort when conducting business. Being the

largest category of e-commerce, it is expected by most of the experts that B2B e-commerce will continue to grow faster than the B2C segment.

([www.londoninternational.ac.uk](http://www.londoninternational.ac.uk), 2011)

**B2C e-commerce:** Business-to-consumer e-commerce, or commerce between companies and consumers, involves customers gathering information; purchasing physical goods (i.e., tangibles such as books or consumer products) or information goods (or goods of electronic material or digitized content, such as software, or e-books); and, for information goods, receiving products over an electronic network. It is the second largest and the earliest form of e-commerce. Its origins can be traced to online retailing (or e-tailing). Thus, the more common B2C business models are the online retailing companies such as Amazon.com, Drugstore.com, Beyond.com, Barnes and Noble and Toys Rus. Other B2C examples involving information goods are E-Trade and Travelocity. (Andam, Z.R.; 2003)

**C2C E-Commerce:** Consumer-to-consumer e-commerce or C2C is simply commerce between private individuals or consumers. Being characterized by the growth of electronic market-places and online auctions, particularly in case of vertical industries where firms/businesses can bid for what They want from among multiple suppliers, it perhaps has the greatest potential for developing new markets.

This type of e-commerce comes in at least three forms:

- auctions facilitated at a portal, such as eBay, which allows online real-time bidding on items being sold in the Web;
- peer-to-peer systems, such as the Napster model (a protocol for sharing files between users used by chat forums similar to IRC) and other file exchange and later money exchange models; and later money exchange models; and
- classified ads at portal sites such as Excite Classifieds and eWanted (an interactive, online marketplace where buyers and sellers can negotiate and which features “Buyer Leads & Want Ads”). (Andam, Z.R.; 2003)

**B2G E-Commerce:** Business-to-government e-commerce or B2G is generally defined as commerce between companies and the public sector. It refers to the use of the Internet for public procurement, licensing procedures, and other government-related operations. This kind of e-commerce has two features: first, the public sector assumes a pilot/leading role in establishing e-commerce; and second, it is assumed that the public sector has the greatest need for making its procurement system more effective. Web-based purchasing policies increase the transparency of the procurement process (and reduce the risk of irregularities). To date, however, the size of the B2G e-commerce market as a component of total e-commerce is insignificant, as government e-procurement systems remain undeveloped. (Andam, Z.R.; 2003)

**The first wave:** The use of networks to exchange money and transfers began in the late 1950s with the development of electronic fund transfers (EFTs). EFTs, or wire transfers, was the electronic transmission of account information over private communication networks. Such activity may be thought of as electronic trading, since businesses and individuals could update accounts and trade via EFTs. In the late 1960s, electronic data interchange was used to reduce the amount of time and effort in putting data such as invoices, purchase orders and bills. EDI allowed for the exchange of information and the execution of electronic transactions between businesses, typically in the form of electronic purchase orders and invoices. Businesses that engage in EDI are referred to as Trading Partners. Due to the high implementation costs only government agencies and large corporations were able to enjoy this technological benefit. ([www.londoninternational.ac.uk](http://www.londoninternational.ac.uk), 2011) It wasn't until 1994 that e-commerce (as we know it today) really began to accelerate with the introduction of security protocols and high speed internet connections such as DSL, allowing for much faster connection speeds and faster online transaction capability. Industry “experts” predicted explosive growth in e-commerce related businesses. In

response to these expert opinions, between 1998 and 2000, a substantial number of businesses in Western Europe and the United States built out their first rudimentary e-commerce websites. (sellitontheweb.com, 2011) However, many of these companies went bust, due to not having sufficiently robust revenue models to generate enough income to sustain their business. As more and more businesses competed for a fixed number of good ideas, internet businesses became over-valued and many bad ideas were also implemented. By 2000, the internet business had started to see a downturn. Thousands of businesses went bust as lack of advertising revenue meant they could not sustain their early promise. ([www.londoninternational.ac.uk](http://www.londoninternational.ac.uk), 2011) The dot-com collapse raised the concerns, and seeing its innumerable benefits, investigations were made for finding the reasons for such an incidence. These investigations came up with following serious flaws made while adopting the technology:

- It was found that e-commerce was limited to a large degree to US businesses and was not global in nature. ([www.londoninternational.ac.uk](http://www.londoninternational.ac.uk), 2011)
- Most of the early e-businesses used English as their language of choice, henceforth, users who did not speak English, or who did not feel confident enough to buy goods and services in English, did not conduct e-commerce.
- Many of the original e-commerce businesses were started with outside investor money-backing good ideas. They focused entirely on how internet could be used to refine business processes and reduce transaction costs and less care was taken regarding developing understanding on how these businesses could produce revenue.
- Email has traditionally been unstructured in terms of how it was used by businesses. Businesses used email for communications without any formal structure which required personnel to read resulting in high cost.
- Email has also been associated with the ever increasing amounts of spam and
- other unsolicited content. The expected reliance on advertising as a revenue source was a major mistake by many e-businesses. The lack of alternative revenue models or an understanding of what online advertising actually yielded in

terms of returns meant that many e-businesses were left with no revenue streams. ([www.londoninternational.ac.uk](http://www.londoninternational.ac.uk), 2011)

**The Second Wave:** In an effort to overcome the flaws of the first wave, and to ensure achievements of new heights, the key characteristics of the second wave of e-commerce can be understood to be based on internationalization and widening participation.

Accordingly, following initiatives came as a landmark to ensure wide acceptance of e-commerce:

- Many businesses have begun to provide global e-commerce presences realising the importance of e-commerce as a global market place. Websites were developed in local languages which are customized to local markets in terms of the content they provide.
- Own funds and capital was mainly used for establishing online businesses.
- Great effort and care is taken in devising revenue models and identifying appropriate revenue streams. There is an emphasis not on who will supply us with revenue, but how are we going to generate revenue.
- Businesses are willing to be flexible in terms of how revenue is generated, and believe that reacting to current trends is the key to establishing a successful online presence.

There has been an explosion in the number of internet users worldwide, and it is fair to say that most countries in the world now have internet access, if not always at the same level of quality. Availability of broadband connections has ensured access to digital content such as video and music can be sold and exchanged online. Even greater emphasis has been put on the use of customised email strategies.

Businesses now use email for formulating deep relationships with consumers and ensuring that consumers are contacted in a timely manner. Businesses today use a multitude of sophisticated advertising approaches that are integrated with their e-business activities. They have developed new strategies for the sale of distributed products with advertising attached. ([www.londoninternational.ac.uk](http://www.londoninternational.ac.uk), 2011)

**Issues in E-commerce Application:** Various applications of e-commerce are continually affecting trends and prospects for business over the Internet, including e-banking, e-tailing and online publishing/online retailing. A more developed and mature e-banking environment plays an important role in ecommerce by encouraging a shift from traditional modes of payment (i.e., cash, checks or any form of paper-based legal tender) to electronic alternatives (such as e-payment systems), thereby closing the e-commerce loop.

In most developing countries, the payment schemes available for online transactions are the following:

**A. Traditional Payment Methods:**

- Cash-on-delivery: Many online transactions only involve submitting purchase orders online. Payment is by cash upon the delivery of the physical goods.
- Bank payments: After ordering goods online, payment is made by depositing cash into the bank account of the company from which the goods were ordered. Delivery is likewise done the conventional way.

**B. Electronic Payment Methods:**

- Innovations affecting consumers: This includes credit and debit cards, automated teller machines (ATMs), stored value cards, and e-banking.
- Innovations enabling online commerce are e-cash, e-checks, smart cards, and encrypted credit cards. These payment methods are not too popular in developing countries. They are employed by a few large companies in specific secured channels on a transaction basis.
- Innovations affecting companies pertain to payment mechanisms that banks provide their clients, including inter-bank transfers through automated clearing houses allowing payment by direct deposit. (Andam, Z.R.; 2003) Even if e-commerce had equipped with so much of benefits, it has undoubtedly suffered with certain loopholes. Various surveys in this regard have come up with various internal and external issues like, unfavorable economic environment, the high cost of ICT, security concerns, poor internal communications infrastructure within SME firms, lack of ICT awareness and knowledge as well as inadequacy of ICT-capable and literate managers and workers, insufficient financial resources, and the perceived lack of relevance or value-added of ICTs to their business. In general, the main issues of concern that acts as barriers to the increased uptake of information technology and e-commerce are the following:

□ Lack of awareness and understanding of the value of e-commerce: Most SMEs in developing countries have not taken up e-commerce or use the Internet because they fail to see the value of e-commerce to their businesses. Many think e-commerce is suited only to big companies and that it is an additional cost that will not bring any major returns on investment. Lack of ICT knowledge and skills:

- Technology literacy is still very limited in most developing countries. Shortage of skilled workers among SMEs, is a key issue in moving forward with using information technology in business. There are also doubts about whether SMEs can indeed take advantage of the benefits of accessing the global market through the Internet, given their limited capabilities in distinct spheres. They can, however, capitalize on returns on the basis that they are the low cost providers.
- Furthermore, SMEs doubt whether Web presence will facilitate their own brand recognition on a global scale or not. Financial costs. The high cost of computers and Internet access (high initial investment) is a barrier for small firms to uptake of e-commerce. Faced with budgetary constraints, SMEs consider the additional costs of ICT spending as too big an investment without immediate returns. (Andam, Z.R.; 2003)

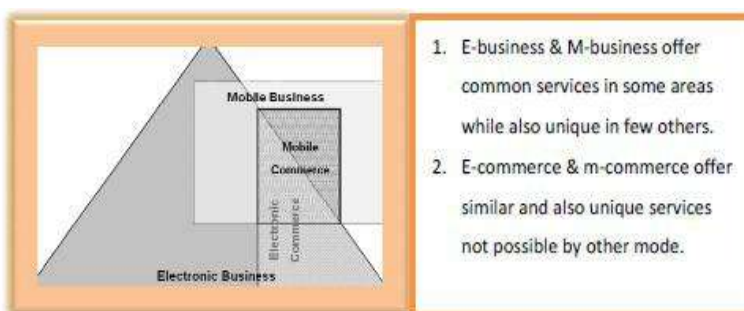

- Infrastructure: The national network/physical infrastructure of many developing countries is characterized by relatively low tele-density, a major barrier to e-commerce. There are also relatively few main phone lines for business use among SMEs.
- Security and Other privacy-related issues: Ensuring security of payments and privacy of online transactions is a key to the widespread acceptance and adoption of e-commerce. While the appropriate policies are in place to facilitate e-commerce, lack of trust is still a barrier to using the Internet to make online transactions. Moreover, credit card usage in many developing countries is still relatively low.

In addition, there are other related reasons and unresolved issues, such as tax evasion, privacy and anonymity, fraud adjudication, and legal liability on credit cards. In many countries, cash is preferred not only for security reasons but also because of a desire for anonymity on the part of those engaged in tax evasion or those who simply do not want others to know where they are spending their money. Others worry that there is lack of legal protection against fraud (i.e., there is no provision for adjudicating fraud and there may be no legal limit on liability, say, for a lost or stolen credit card). It is necessary to distinguish these concerns from the general security concerns (i.e., transaction privacy, protection and security) since they may not be addressed by the employment of an effective encryption method (or other security measure). (Andam, Z.R.; 2003)

**M-COMMERCE:** As content delivery over wireless devices becomes faster, more secure, and scalable, the novel inventions led the generations into the new era of mobile-commerce (m-commerce), and some believe that m-commerce will surpass wire-line e-commerce as the method of choice for digital commerce transactions. This may well be true for the Asia-Pacific where there are more mobile phone users than there are Internet users. Mobile Commerce, is the ability to conduct commerce using a mobile device, such as a mobile phone, a Personal Digital Assistant (PDA), a smart-phone, or other emerging mobile equipment (en.wikipedia.org). To put in simple words, M-commerce (mobile commerce) is the buying and selling of goods and services through wireless technology, i.e., hand-held devices such as cellular phones and personal digital assistants (PDAs). Japan is seen as a global leader in m-commerce. (Nagaraju, 2010) According to Webagency, 2001, M-Commerce has been defined as under:

“Mobile Commerce is the use of information technologies and communication technologies for the purpose of mobile integration of different value chains a business processes, and for the purpose of management of business relationships.” Web agency, 2001. ([www.themanager.org](http://www.themanager.org), 2011)

M-commerce is a by-product of the technology convergence of information technology (IT) with telecommunication technologies (TCT). Together they are referred to as information and M-commerce may be thus regarded as an extension of electronic commerce (ecommerce) to wireless media. This convergence, however, enables some unique, location-based services, hitherto not possible in e-commerce. These innovative services are made possible by the convergence of these two technologies.

Today, the scope of m-commerce encompasses almost every walk of life. Mobile services are reported in the fields of content, entertainment, travel, banking and marketing. (Tiwari, R. et al., 2008)

**Fig. 1: M-Commerce and E-Commerce**

Source:

[www.binarymantrasystems.com](http://www.binarymantrasystems.com) (2009); Whitepaper Future of m-Commerce, P-2.

**Feature of M-Commerce:**

- 1) Ubiquity- It means that the users can avail of services and carry out transactions largely independent of his current geographic location.
- 2) Immediacy- It provides real-time availability of services.
- 3) Localisation- Location based services such as GPS, allow companies to offer goods and services to the user specific to his current location.
- 4) Instant Connectivity- This feature brings convenience to the user, due to introduction of services like GPRS which keeps users always in touch and connected.

Simple authentication- Mobile telecommunication device function with an electronic chip called SIM, which is easily identifiable. This in combination with an individual Personal Identification Number (PIN) makes the authentication process simple.

**History of M-Commerce:** Mobile commerce was born in 1997 when the first two mobile-phones enabled Coca Cola vending machines were installed in the Helsinki area in Finland. The machines accepted payment via SMS text messages. The first mobile phone-based banking service was launched in 1997 by Merita Bank of Finland, also using SMS. A major leap took place when two major national commercial platforms for mobile commerce were launched in 1999. These included Smart Money in the Philippines, and NTT DoCoMo's i-Mode Internet service in Japan. Mobile-commerce-related services spread rapidly in early 2000. Norway launched mobile parking payments. Austria offered train ticketing via mobile device. Japan offered mobile purchases of airline tickets. In order to exploit the potential mobile commerce market, mobile phone manufacturers such as Nokia, Ericsson, Motorola, and Qualcomm are working with carriers such as AT&T Wireless and Sprint to develop WAP-enabled smart-phones. Smart-phones offer fax, e-mail, and phone capabilities. Since the launch of the i-Phone, mobile commerce has moved away from SMS systems and into actual applications. SMS has significant security vulnerabilities and congestion problems, even though it is widely available and accessible. In addition, improvements in the capabilities of modern mobile devices make it prudent to place more of the resource burden on the mobile device. This is seen as a bridge between the gaps created by e-commerce and in-store shopping, and is being utilized by physical retailers as a way to compete with the lower prices typically seen through online retailers. Products and services available:

Mobile ticketing

Mobile vouchers, coupons and loyalty cards

Content purchase and delivery

Location-based services

Information services

Mobile banking

Mobile Store Front

Mobile brokerage

Auctions

Mobile Browsing

Mobile marketing and advertising. (en.wikipedia.org, 2011)

Industries affected by m-commerce include:

- Financial services, including mobile banking (when customers use their hand-held devices to access their accounts and pay their bills), as well as brokerage services (in which stock quotes can be displayed and trading conducted from the same handheld device);
- Telecommunications, in which service changes, bill payment and account reviews can all be conducted from the same handheld device;
- Service/retail, as consumers are given the ability to place and pay for orders on-the-fly; and

- Information services, which include the delivery of entertainment, financial news, sports figures and traffic updates to a single mobile device.

(searchmobilecomputing.techtarget.com, 2011)

**Present Scenario:** According to a survey made by Informa (Nov 2007), there are currently over 3 billion mobile phones worldwide, that is, approximately 40% of the world's population currently carries a mobile phone. The chart below puts this figure in the context of other major technologies. Mobile phone adoption continues to grow. In many developed countries mobile phone penetration is well above 90%, so saying "everyone has a mobile phone" has become a reality.

*Chart 1: Mobile phones in context*

(Source: Informa, Tomi Ahonen, Jan. 2007)

Source: Mobile Commerce: Opportunities and challenges, A GS1 Mobile Com White Paper. February 2008 Edition. PAGE-10.

**Mobile Commerce: Beyond E-Commerce:** Throughout the 1990s the introduction of the internet and e-commerce reshaped the way that businesses do business and the way that consumers interact with businesses. Businesses took the opportunity to automate many processes that before would have been handled manually, from ordering to customer service. One clear example is the way that spending on advertising has begun to shift from traditional off-line media to online and digital media as advertisers have seen an opportunity to better connect with their target audience. IBM forecasts 22% growth in mobile, digital and interactive advertising formats between 2006 and 2010 against 4% growth in traditional advertising formats. Mobile commerce, often referred to as m-commerce, builds on the advances made by ecommerce (such as automated, electronic processes) but makes interaction available to a wider audience in a more personalized way. Like any emerging market, there are many propositions about how to use this technology. Some organizations adopt an aggressive policy and want to get something moving as fast as possible whilst others adopt a wait-and-see approach. As a result, proprietary solutions are developed that make integration with existing systems or by multiple partners complex and costly. At the same time, multiple solutions create a complex landscape for businesses and consumers alike - making it difficult to choose which solution to use. The other difference between ecommerce and m-commerce is the opportunity to connect information with objects in a more direct way than has been possible until now. This is the world predicted by the Internet of Things, a report published by the International Telecommunications Union (ITU) in 2005, where objects have a life and history of their own that we can use to our advantage. The mobile phone can be the tool that connects the physical and virtual world. At the base of this vision is the ability to identify objects uniquely. What is special about mobile phones is the fact that they have massive adoption globally. Many more people have access to a mobile phone than to a computer and this means that m-commerce has the opportunity to connect not just big businesses but also small business and consumers on a massive scale. In this sense, mobile phones have the potential to bridge the digital divide and allow organizations and individuals to reach out to one another more easily than ever before. We're moving into a world where digital goods are becoming as

important as physical goods. Due to the internet, value is created not just by goods themselves but by the exchanges of those goods. Organisations that can facilitate that exchange (for example by creating communities of users with similar interests) have a significant competitive advantage in this networked world. Furthermore, these communities can be leveraged to increase sales of physical goods through more engaged users. (GS1 Mobile Com, 2008)

**Future Categories:** In the future other categories will come to light, mirroring technologies just now gaining steam on the internet. Potentially, peer to peer networks will develop in the wireless world, Although no such technology exists today. For instance, going back to the vending machine example, what if vending machines in a certain area, say a college campus, could talk to each other in a peer to peer fashion. When a machine runs out of a certain type of product, and a user shows up and requests that product, the machine can refer the user to the closest machine which does have the product in stock. Possibly even forwarding the money already entered to the new machine. This is just one example of the many technologies, most not yet even thought of, which will undoubtedly develop under the umbrella of m-Commerce. (Hunter, J.L.; 2002)

**CONCLUSION:** From the above discussion we can easily put-forth that commerce has gone through revolutionary changes to keep pace with changing world. In this wake, it has traveled phase of traditional commerce to e-commerce. E-commerce had played game changing role for businesses around the world. Albeit, having some drawbacks, it had generated enormous opportunities for businesses to accelerate upon others. Even, it opened the path for future technological development possibilities for the businesses for ensuring easy access to customers. This possibility and innovations in technology led to the emergence of a recent phenomenon - "m-commerce". Innovation in mobile market had made it all possible. However, with it had aroused certain concerns regarding its use and security. Seeing the enormous opportunities in this field, it is required that the initiatives should be carefully framed out keeping in mind all possible loopholes that may arise in future, to escape it from any failures.

## **FOREIGN TRADE POLICY IN INDIA**

**Dr.Suhas Avhad**

*Professor Head, Dept.of Economics, S.M.B.S.T.College, Sangamner*

**Introduction :** The Foreign Trade refers to the exchange of goods, capital or specific services beyond the international territory with the prior authentication from the government authorities. The gross domestic product (GDP) of most of the countries is having key relationship with international Trade. The financial system of the country is majority depends on its perspective & adaptation of exports & imports from other countries so that the foreign currency can be magnetized to improve the overall economic scenario & related factor which includes the inflation rate, banking modules, generation of employment & many other to escalate the nation in assorted dimensions from the research reports of year 2014, it is found that India is on 19<sup>th</sup> position in terms of principal exporter in the global market having exports equivalent to 3.5 trillion dollars. The gross domestic product (GDP) of the market of the countries having key relationship with the international Trade. After independence there were no specific or strict rules regarding the export & import. In the new foreign trade policy which is known as a foreign trade policy 2015-2020, its broadcasted that there will be the special incentives & promotions for the exporters in different streams. Govt. of India is promoting & attracting the domestic exports to work on 'Make in India' so that the Indian products can be sold in International Market & overall economy can be strengthened. Govt. of India is predicting the export of 900 billion dollar by year 2020 after implementation of the new foreign trade policy.

**Research Objective :** The Foreign trade policies are decidedly effective in terms of promoting the new EXIM client & ventures. still there is the need to analyze various factor which can affect the overall economy & EXIM status of the nation.

**Importance of foreign Trade for Developing Economy :** Before 1947 when India was a colony of the British, the pattern of her foreign trade was typically colonial. India was a supplier of foodstuff & raw materials to the industrialized nations particularly England & an importer of manufactured goods. This dependence on foreign countries for manufactures did not permit industrialization at home rather as a result of the competition from British manufactures. The indigenous handicraft suffered a severe blow. The evolution of India's foreign trade policy can be understood within the context of external dynamics & domestic priorities India's international trade policy following her independence in 1947 focused on economic nationalism. During 1947-1990 India's economic development strategies were guided by an inward looking development strategy based on the idea of self reliance & infant industry policy i.e stimulating home grown industrialization & import substitution & minimal reliance on international trade. With the world based on complex independence India's prosperity is intrinsically linked to the development in the global economy. This is the reason that India has seen greater engagement with the world economy through its enhanced integration into global value chains over the last two decades. The data analysis of export, imports & foreign investment inflows in terms of both FDI & FIT reflective of this trend. The main objective of this policy was to ensure the countries independent development. The foreign Trade policy refers to the exchange of goods, Capital & Services beyond the international territory. The gross domestic product of most of the countries is having key relationship with the international trade. A Product or Services that is transmitted to the international market refer as an Export while the Import refers to buying the product or services from beyond the world.

**Trends in India's Foreign Trade Policy:** With the world based on complex interdependence, India's prosperity is intrinsically linked to the development in the global economy. This is the reason that India

has seen greater engagement with the world economy through its enhanced integration into global value chains over the last two decades. The data analysis of export & import inflows in terms of foreign direct investment.

**Trends in Export & Import in India:** India's exports have seen upward trends since the new millennium have increased from 44560.29 million dollars to 314405.3 million dollars in 2013-14. Thereafter export have slowly declined to reach 262290.3 million dollars in 2015-16. Similarly India's Import also increased from 50536.45 million dollars to 490736.65 million dollars in 2012-13, and downward 381006.63 million dollars in 2015-16.

**Highlights of current Foreign Trade policy (2015-2020) :**

1. The Central Government announced two new scheme foreign trade policy are "Merchandise export from India Scheme" (MEIS) & "Service Exports from India Scheme" (SEIS).
2. The Merchandise export from India to promoting specific services for specific market.
3. All Service scheme have been replaced by a Service Exports from India Scheme
4. Foreign Trade policy would reduce export obligation by 25 % and give boost to domestic manufacturing.
5. Both "Merchandise export from India Scheme" (MEIS) & "Service Exports from India Scheme" (SEIS) firms & services providers can now get subsidized office space in Special Economic Zone, along with other benefit.
6. Books, handicraft & handlooms are eligible for benefit of Merchandise export from India Scheme & export up to Rs.25000 per consignment will get Service Exports from India Scheme.
7. As part of Digital India vision mobile app would be created to easily filling taxes, Stamp duty, Automatic money transfer using Internet Banking.
8. The higher level of support to be provided to processed and packaged agriculture items and foods items under Merchandise export from India Scheme.
9. Industrial product to be support in major markets at rates ranging from 2% to 3%.
10. The business services, hotel and restaurants to get rewards scrip under Service Exports from India Scheme at 3% other specified services at 5%.
11. Freely transferable & usable for payment of custom duty, excise duty and service tax.
12. The criteria for export performance for recognition of status holder have been changed from rupees to dollars.
13. Inter-ministrial consultations to be held online for issue of various licenses.
14. No need to repeatedly submit physical copies of document available on Exporter important profile.
15. Export obligation period for export items related to defense, military store, aerospace and nuclear energy to be 24 months instead of 18 months.
16. Kerala, Calicut, Arakonam & Tamilnadu Airport notified as registered ports for import & export also Vishakhapatnam and Bhima

**Measures in the new foreign trade policy :** The central government published foreign trade policy statement giving in brief the dynamic sub global market and India's trade performance, challenges and declared vision, mission, goals and objectives for increasing export, professional and competitive approach is necessary in marketing. The tax incentive can be gradually reduced once the units become sustainable. Ensuring adequate availability of raw material inputs regularly and at reasonable prices to the SME export units is to ensured. The Foreign Trade Policy announced by the minister of state for commerce and Industry on 1<sup>st</sup> April 2015 attempts to fix some of the problems. Indian manufacturing

sector is geared to move fast under the dynamic leadership of the India's Prime Minister of India with remarkable initiatives like Make In India, Digital India, Skill India which is in tune with the Foreign trade Policy. India expected to rank among the world's top three growth economies and amongst the top three manufacturing destinations.

**Conclusion :** Due to uneven distribution of natural resources, some countries are more suitable place to produce some goods more economically than other countries. Further the underdeveloped & developing countries have to depend upon developed countries for financial help, which ultimately encourages foreign trade. According to the theory of comparative cost, each country should concentrate on the production of those goods or services for which it is best suited & specializes in the production of that goods or services, thus there is a significant increase in the overall production with minimized costs and resulting in higher standard of living of the people. Foreign Trade policy helps in increasing the revenue of a nation by improving on the exports, which in turn help in improving the balance of payment. Foreign Trade propels economic growth & national development. The primary purpose is not the mere earning of foreign exchange, but the stimulation of greater economic activity.

## CHILD LABOUR IN AGRICULTURE: PROBLEMS AND PROSPECT

Navghan K. Divraniya

Assistant Professor, R.V. Patel College of Commerce, Amroli – Surat (Gujarat) 394107

**Introduction:** Children are the future of any society and in turn they shape the worlds future. That is why the issue of child labour is an area of concern for all the policymakers, social scientists, researchers and judiciary. The problem of child labour has been one of the major issues to be tackled in any economy as it is a developmental issue considering the ill effect of its prevalence. The problem of child labour is not national but international. All the countries whether developed, developing or underdeveloped are facing one or other kind of issue related to child labour. But, the issue of child labour is seen in worst form in some of the developing countries. As per an estimate of ILO, 40 million in modern slavery and 152 million in child labour around the world. By employing children we are denying their right to education, which is crucial for their development.<sup>1</sup> Child labour is a complex global problem; it is a hidden bitter truth. Whenever one thinks about this problem, the class that attracts ones utmost attention is that of the children who are found to be working in the fields, factories, mines, hotels, motor repairing shops, Dhabas etc. The root cause of this problem is multi-dimensional comprising economic, social, educational and cultural. This is one social evil that deprives a very large number of children of children of their basic fundamental rights. Every child born in this world has some fundamental birth right which includes the right to a healthy mental and physical development. However, children of a very few countries in the world automatically get these right, while the millions of children especially in the third world nation are deprived of these right. Their situation is so bad that inspite of the efforts international agencies like ILO, UN, UNICEF, WHO, IMF and government, organization, voluntary agencies etc. Of various nations, millions of children suffer from poverty, deprivation, physical and mental torture violence, malnutrition, addiction, diseases etc. And many of them die at young age. Eradication of this global problem is a big challenge before the governments, because if there is no sufficient physical, mental and educational development of these minor workers, how will they contribute to the development of the nation? In fact, child labour hinders the national development, so it is necessary to completely eradicate this problem. Considering the seriousness of the problem of labour world over, it has been decided to observe 12<sup>th</sup> June each as International Anti- Child Labour Day.

**Definition of child labour:** What is child labour? There is no universally accepted definition of Child Labour the definitions change according to various view point and under various laws. But generally speaking when children work for wages awes from their homes and families. And if their workplace is unfriendly and unfavorable for their well-being, they are called Child Labour.

Various definitions have been advanced to define child Labour. According to ILO, “child labour includes children prematurely leading adult live, working long hours for low wages under conditions damaging to their health and to their physical and mental development sometimes separated from their families, frequently deprived of meaningful educational and training opportunities that could open up for them a better future”. Though another project of ILO defines that “*Child Labour refers to the work that deprives children of their childhood, their potential and their dignity and that is harmful to their physical and mental development*”.<sup>2</sup> In other words, it refers to work that is mentally, physically, socially or morally dangerous and harmful to children and interfere with their schooling (1) by depriving them of the opportunity to attend the school (2) by obligating them to leave school permanently or (3) by requiring

---

<sup>1</sup> www.ilo.org

<sup>2</sup> INDUS in their publication Mapping Child Labour: A Training Manual, 2006

them to attempt to combine school attendance with exclusively long or heavy work. According to UNICEF<sup>3</sup> children in the age group of 5-11 who perform at least one hour of economic work or twenty eight hours of domestic work per week come under child labour. Similarly, children in the age group of 12-14, 15-17 who perform, fourteen and forty three hours of economic work respectively, are defined as child labour. In the case of the former group the domestic working hours are limited 28 hours. After analyzing the above definition, it can be said that all the work done by the children should not be classified as child labour. Where the participation of children in work is not affecting their health and personal development or interferes with their schooling is generally regarded as sometime positive. Activities such as helping parents around home, assisting family business or earning pocket money outside school hours and during school holidays, should not be treated as child labour. Such activities contribute to childrens development and to the welfare of their families, they provide them with skill and experience and help in preparing them to be productive members of their society during their adult life. With this brief background, the following section shall be devoted to review of literature, followed by the status of child labour, strategies and conclusions.

### Review of Literature

**Basu and Van (1998)** In this interesting paper child labour in general equilibrium setting in which parents dislike child labour and withdraw their children from the labour force once the adult minimum wage reaches a critical level. This model establishes the possibility of two stable equilibrium, a low wage equilibrium characterized by child labour and a high wage equilibrium in which children are all attending the school.

**Jain D. and Chand M. (1991)** their study examined that girls between 9 and 19 years worked much harder in agriculture fields and animal husbandry than boys of the same age, but they work less than boys in non-agricultural labour. They were of the view that work participation rate depend on the type of the work and facility available. Another interesting finding was that the age structure of the female child worker is lower than that of males. This picture is reinforced by the higher rate of non-enrollment in schools and school dropout among girls than boys.

**India committee of the Netherland (Oct., 2004)** In Andhra Pradesh, a large proportion of the workforce in cotton farms are children. Over two thirds of the labour force (67.2 percent) is children in the age group of 7 to 14 years. Among children, girls account for nearly 88 percent. Women (girls and adult women) account for nearly 80 percent of the total labour force. 15 to 18 year's age group of workers account for nearly 21 percent of the total labour force.

**Venkateswarlu D. (2007)** During 2006-07 an estimated total number of 4,14,390 children (2,23,940 below 14 years and 1,90,450 are 15-18 age group) were employed in cotton farms in India. Children constitute about 77 percent in AP, 84.5 percent in Karnataka, 79 percent in Tamilnadu and 66 percent in Gujarat of the total workforce. No other industry in India has such a high proportion child labour in its workforce.

**World Vision Australia (2012)** The study explained that what children receive is often well below the minimum wage. In Gujarat, India, a child working on a cotton seed farm receives less than \$1 per day. Children may work up to 12 hours in extreme temperatures. In Uzbekistan, children are made to work from early in the morning to evening, without sufficient food. Exhaustion, heat stroke and malnutrition are common amongst child labourers. Children are forced to work in unbearable conditions and in some cases stay in crops store area or farm machinery. Physical and sexual abuse of child cotton labourers has also been widely reported. School children can be given harvest quotas as large as 50 kg of cotton per day and are beaten or threatened if they fail to meet their quota or pick low quality cotton.

---

<sup>3</sup> Vide [www.Childinfo.org/labour](http://www.Childinfo.org/labour)

### Global Trends in Child labour

Any Nation in the world – be it a developed, developing or underdeveloped- face several problems regarding children in their various manifestation.

- Worldwide 218 million children between 5 and 17 years are in employment. Among them, 152 million are victims of child labour; almost half of them, 73 million, work in hazardous child labour.
- In absolute terms, almost half of child labour (72.1 million) is to be found in Africa; 62.1 million in the Asia and the Pacific; 10.7 million in the Americas; 1.2 million in the Arab States and 5.5 million in Europe and Central Asia.
- In terms of prevalence, 1 in 5 children in Africa (19.6%) are in child labour, whilst prevalence in other regions is between 3% and 7%: 2.9% in the Arab States (1 in 35 children); 4.1% in Europe and Central Asia (1 in 25); 5.3% in the Americas (1 in 19) and 7.4% in Asia and the Pacific region (1 in 14).
- Almost half of all 152 million children victims of child labour are aged 5-11 years. 42 million (28%) are 12-14 years old; and 37 million (24%) are 15-17 years old.
- Hazardous child labour is most prevalent among the 15-17 years old. Nevertheless up to a fourth of all hazardous child labour (19 million) is done by children less than 12 years old.
- Among 152 million children in child labour, 88 million are boys and 64 million are girls.
- 58% of all children in child labour and 62% of all children in hazardous work are boys. Boys appear to face a greater risk of child labour than girls, but this may also be a reflection of an under-reporting of girls' work, particularly in domestic child labour.
- Child labour is concentrated primarily in agriculture (71%), which includes fishing, forestry, livestock herding and aquaculture, and comprises both subsistence and commercial farming; 17% in Services; and 12% in the Industrial sector, including mining.<sup>4</sup>

### Sector wise Child Labour in the world

Sector	Number of child labour ('000)	Percentage (%)
Agriculture	107543	70.9
Industry	18007	11.9
Services	26072	17.2

Source: global estimate and trend of Child labour ILO, 2016.

### Sector wise Child Labour in the world

<sup>4</sup> Global Estimates of Child Labour: Results and trends, 2012-2016, Geneva, September 2017.

It can be seen from the above table and chart that highest number of child labour found in Agriculture sector in the world followed by service sector and industrial sector respectively. In agriculture sector around 71 percent of total child labourers are employed while service sector and industrial sector consist 17.2 and 11.9 percent of child labour respectively.

**Status of Child labour in India:** As per Census 2011, the total child population in India in the age group (5-14) years is 259.6 million. Of these, 10.1 million (3.9% of total child population) are working, either as ‘main worker’ or as ‘marginal worker’. In addition, more than 42.7 million children in India are out of school. However, the good news is that the incidence of child labour has decreased in India by 2.6 million between 2001 and 2011. However, the decline was more visible in rural areas, while the number of child workers has increased in urban areas, indicating the growing demand for child workers in menial jobs. Child labour has different ramifications in both rural and urban India.

**Incidence of child labour in India**

Year	Percentage of working children (5-14)			Total number of working children (5-14) (in millions)		
	Rural	Urban	Total	Rural	Urban	Total
2001	5.9	2.1	5.0	11.4	1.3	12.7
2011	4.3	2.9	3.9	8.1	2.0	10.1

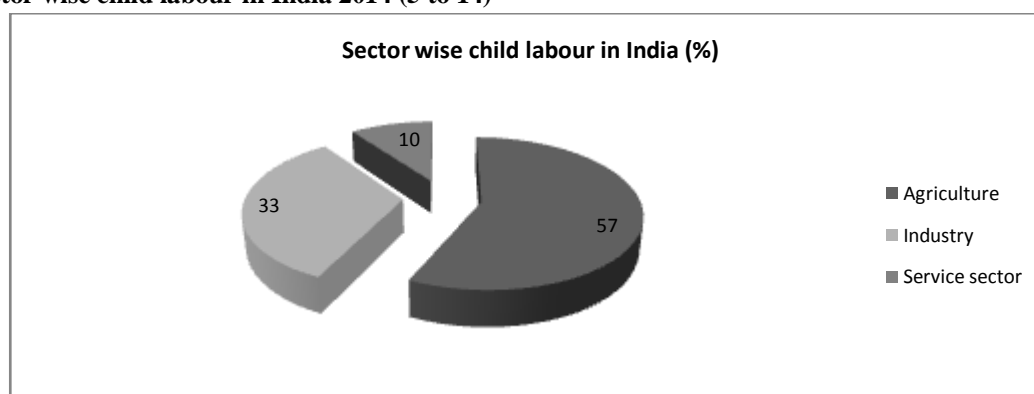

Source: Census of India 2001, 2011.

**Sector wise child labour in India 2014 (5 to 14)**

Sector	Percentage of child labour
Agriculture	57
Industry	33
Service sector	10

Source: US Department of Labour’s Bureau of International Labour Affairs (2014) “India Findings on the Worst Forms of Child Labour”, p. 1.

**Sector wise child labour in India 2014 (5 to 14)**

It can be understood from the above information that in India Agriculture sector employs highest number children. In 2014 around 57 percent of total child labours were employed in agriculture sector; 33 percentage of total child labour were employed in industrial sector while 10 percentage of total child labour were engaged in service sector.

**National Legislations and ILO conventions**

The enactment of the Child Labour Amendment (Prohibition and Regulation) Act, 2016 and The Right to Education Act 2009 have paved the way for ratification of ILO's two core conventions;

1. Convention No 138 stipulates that the minimum age at which children can start work should not be below the age of compulsory schooling and in any case not less than 15 years; with a possible exception for developing countries.

2. Convention No. 182 prohibits hazardous work which is likely to jeopardize children's physical, mental or moral health. It aims at immediate elimination of the worst forms of child labour for children below 18 years.

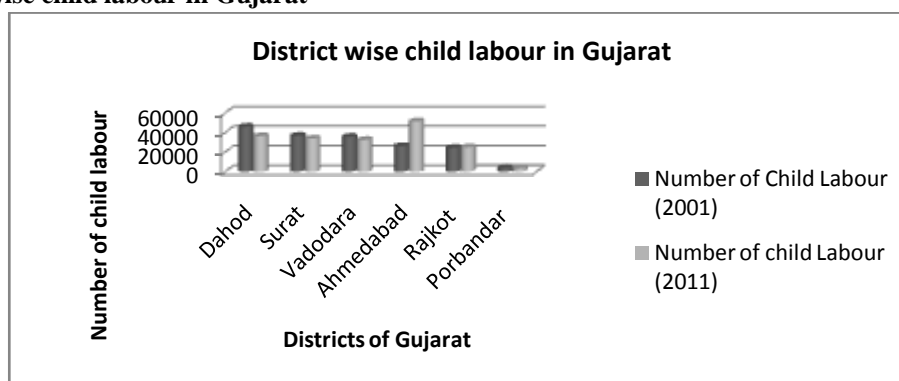

**Status of Child Labour in Gujarat:** According to NSSO Report published in 2009-10, the total number of child labour in Gujarat was 3,90,687 out of which 86,130 in urban areas and 30,4,557 in rural areas. The NSSO Report on "Employment and Unemployment situation in India" published in January 2014 shows that around 4.2 lakh child labour in Gujarat. Out of which 3.18 lakh child labour in rural area and 1.2 lakhs are in urban area. As per this report out of total number of child labour 2.2 percent in urban area and 4.3 percent in rural area in the age group of 5 to 14 years. In consideration of above figures Gujarat state was ranked among top five states in which there is highest child labour. In Gujarat the number of child labour is highest among the large 20 states of the country except zarkhand. In India, while considering urban areas, Gujarat ranked fourth in the country. Child labour in West Bengal 12.6 percent, in UP 4.4 percent and in Orrisa 4.1 percent.<sup>5</sup> According to census 2001 the numbers of child labour in Gujarat was about 4,85,530, decrease to 2,50,318 in 2011. Thus, within ten years child labour in Gujarat decrease by 50 percent. This is mainly due to initiatives taken by the government regarding various child labour Acts and child welfare schemes.

#### District wise child labour in Gujarat

District	Number of Child Labour (2001)	Number of child Labour (2011)
Dahod	46085	36493
Surat	36824	34066
Vadodara	35731	32607
Ahmedabad	26291	51552
Rajkot	24586	25102
Porbandar	4086	3752

Source: Census 2001 and 2011.

#### District wise child labour in Gujarat

By above data we can understand that as per census 2001 highest number of child labour in Dahod District. While as per census 2011 Ahmedabad district has highest number of child labour. Though, proportion of child labour has been reduced during the decade but still the incidence of child labour in rural Gujarat is too high. The problem of child labour is more acute in rural areas than that of urban areas in the state. These are mainly in fields and farms.

**Conclusion:** Finally we can conclude that there are number of legislative measures, laws and constitutional provisions, government, educationists, unions, non-government institutions are existing in India. Apart from these international organizations such as UN, ILO, UNICEF, UNESCO, CRY etc. are actively working to stop child labour but the problem is still not to be solved. Though the proportion of child labour in urban areas has come down, but in rural areas, it is more serious and complex problem. The child labour failed to experience normal physical and mental growth due to work pressure, day in extreme temperature during winter. They also sacrifice their basic human rights such as, nutrition, health, and education, recreation, sufficient opportunities for their physical and mental development. Unfortunately, reality is that there are not any proper, suitable, effective and universally acceptable measures that can be taken to improve the condition of them, and curb the child labour. The socio-economic scenario and the availability of recourses, a sequential, progressive, integrated, multidimensional and multilateral approaches are needed to achieve the gradual elimination of child labour.

## **GREEN JOBS: A STRATEGY FOR ENVIRONMENTALLY SUSTAINABLE ECONOMY AND SOCIAL DEVELOPMENT**

**Sanjit Mondal**

*PhD Research Scholar, Department of Development Studies, RGNIYD (Chennai)*

Economic activity and employment upon basic courses on keeping up a vital separation from continued with resource utilization and safeguarding ecosystem and environmental administrations. Without opportune activity on dire ecological issues, many jobs could be lost because of resource exhaustion, biodiversity misfortune, extending cataclysmic occasions, and distinctive aggravations. In the meantime, the world faces comparably Challenging employment issues. Overall Unemployment stays at roughly 6percent, impacting a portion of the scope of 190 million individuals. What's more, an extensive number of the 3 billion or people aged 15 or more seasoned who have jobs go up against powerless employment circumstances. Around 487million workers don't win enough to transcend the the\$1-a-day level of extreme poverty, and a normal 1.3 billion workers get under \$2 a day. Many people, particularly in developing countries, work in "easy going" circumstances set apart by low pay, perilous conditions, and no medical coverage. Countless young people enter the labour market each year; with the exception of only one out of every odd one of them secure gainful employment. In 2008, even as 40 million new employees were being made, the International Labour Organization (ILO) expected world unemployment to grow by 5 million. Green jobs offer a technique for making better than decent work while in the meantime achieving environmentally sustainable economic and social development. Green jobs decreased the environment effect of enterprise and economic sector, inevitably to levels which are sustainable. In 21st centuries the world is confronting two characterizing challenges. The first is to give jobs that can convey economic growth, not too bad working conditions and social development for all. This consolidates lifting more than 1.3 billion people (four out of ten specialists on the planet) and their families above the poverty line and giving decent job opportunities for the 500 million young people's entering the labour market throughout the following 10 years. It likewise implies access to present day shape to energy for 1.6 billion individuals who still don't have any or better than average lodging, and sanitation for more than 1 billion ghetto inhabitants in megacities. The second is to turn away dangerous climate change and keep an advancing crumbling in regular assets imperilling the way of life of present and who and what is to come. These two difficulties are personally connected and should be handled together. Green jobs offer a technique for creating decent work while in the meantime achieving environmentally sustainable economic and social development. Green jobs reduce the environmental impact of enterprises and economic sectors, eventually to levels which are sustainable. They add to diminishing the requirement for energy and raw materials, to avoiding greenhouse gas emissions, to restricting waste and sully, and to re-setting up biological communities like clean water, surge insurance, and biodiversity.

### **Objectives**

1. Review of Concept the Green Jobs
2. To study the Impact of Green jobs on Environmentally Sustainable Economy
3. To study the Green Jobs and Social Development

**Methodology:** This study purely based on secondary tools of research, for help of Reference regarding Report of Green jobs, labour market, climate change and sustainable economy and social development. Report published by national and international government and non-government organization like as WB, UNDP, ILO, UNEP, Ministry of Environment, various articles by researchers, and also available data.

This study is useful to various angle, rationality of this study is basic to worldwide because we studied the relationship between green jobs and sustainable development, green jobs and environmental economy. This paper recommendation and conclusion is also beneficial for next generation of research and policy makers.

**Concept of Green jobs:** The quest for supposed "green jobs"— employment that adds to ensuring the earth and diminishing humankind's carbon impression—will be a key monetary driver of the 21st century. "climate proofing" the worldwide economy will include substantial scale interests in new technologies, infrastructure, building, and equipment, which will give a noteworthy jolt to truly necessary new business and an open door for holding and changing existing employments. The term 'green-collar jobs' was utilized as ahead of schedule as 1976, got from existing depictions of jobs as blue or white-collar, to mean the developing number of jobs in environmental occupations (Segal 2008). The term was promoted from around 2001 onwards by bunches like the Apollo Alliance which united various interests to contend for a 'more responsible option' occupations creation system and better open doors in the green economy for those left behind by past times of development. It was amid this time green-collar employments were characterized as being subjectively not the same as 'green jobs' in offering 'generously compensated, profession track jobs that contribute specifically to saving or upgrading environmental quality'. To address unemployment (the social challenge), the nation needs to move towards an economy that makes a noteworthy number of new jobs. Green jobs offer a method for producing decent work while all the while accomplishing environmentally sustainable economic and social development (environmental challenge). Green jobs decrease the environmental impact of enterprises and economic sectors, to levels which are ultimately sustainable. They add to decreasing the requirement for energy and raw materials, to staying away from ozone harming substance discharges, to limiting waste and contamination, and to re-establishing ecosystem like clean water, surge insurance and biodiversity. For the ILO, the idea of green jobs condenses the transformation of economies, enterprises, workplaces and labour markets into sustainable practices providing decent work. Along these lines, 'Green jobs' are jobs which help to diminish negative environment impacts, at last prompting environmentally, economically and socially sustainable enterprises and economies. More precisely, green jobs are decent jobs that:

- Reduce the utilization of energy and raw materials
- Limit greenhouse gas emissions
- Minimize waste and pollution, and
- Protect and re-establish ecosystems

Green jobs should be decent, which is regularly especially difficult in occupations in waste management, agriculture and other precarious employment relationships. Thus it is basic that the decent work approach is taken when taking a gander at green jobs. Decent jobs are jobs are occupations which guarantee essential human and labour rights, social protection and the privilege to practice social dialogue for workers.

**Impact of Green jobs on Environmentally Sustainable Economy:** Unemployment is viewed as a macroeconomic unevenness that influences every single modern economy. The size and elements of unemployment impacts and are affected by the economic circumstance of every nation, by investment in education, quality of life and other factors specific to each economy. Economic activity and employment depend in essential routes on maintaining a strategic distance from proceeded with resource depletion and defending environments and ecological services. Without convenient activity on pressing environmental problems, many jobs could be lost because of resource consumption, biodiversity loss, increasing natural disasters, and different interruptions. Addressing the climate challenge requires a multipronged approach, including the advancement of progressively favourable advances, more noteworthy proficiency of energy and raw material utilize, adjusted way of life and utilization decisions, economic restructuring, and

environmental restoration endeavours. It additionally expects adjustment to those progressions that now appear to be unavoidable and maybe irreversible. This adds up to no less than a fundamental ecological transformation of the economy. The surging enthusiasm for the crossing point of environment and employment during a period of profound crisis in both areas. With the rising phantom of climate change, humanity faces a severe environmental emergency. Both the 2007 evaluation by the Intergovernmental Panel on Climate Change (IPCC) and the broadly noted Stern Review, which cautions of the catastrophic economic outcomes of climate inaction, have loaned new urgency to countering what might be humanity's greatest challenge ever. As the world moves toward a low-carbon, sustainable economy, those companies, countries, and regions that are leaders in green innovation, design, and technology will be more likely to retain and create new green jobs. The laggards, meanwhile, may incur substantial business and job penalties. The pursuit of "green jobs"—employment that contributes to preserving or restoring environmental quality and avoiding future damage to Earth's ecosystems—will be a key economic driver in the 21st century. Achieving a low-carbon global economy requires large-scale investment in new technologies, equipment, buildings, and infrastructure—which will be a major stimulus for much-needed employment. Resource extractive and vigorously dirtying enterprises are probably going to feel the best effect of the advance toward supportability. Be that as it may, blocking natural activity would not really spare employments in these businesses. Due to the quick pace of mechanization and asset consumption, work is as of now contracting in huge numbers of these segments, even as yield develops. Actually, employments will probably be in danger in businesses where natural measures are low and "clean-tech" development is slacking. As the desperation of maintainability rises, so does the cost of a do-nothing technique that misses open doors for early activity.

**Green Jobs and Social Development:** While the United Nations Conference on Environment and Development (UNCED), or Earth Summit, in Rio de Janeiro in 1992 accentuated the requirement for adjust between the financial, social and ecological measurements of maintainable advancement, the result record had exceptionally restricted scope of work issues and was to a great extent quiet on their relationship to manageable improvement. The United Nations Framework Convention on Climate Change (UNFCCC), one of the three ecological traditions embraced in Rio, made no reference at all to work and work issues. The generally far reaching Agenda 21 additionally delivered by the Summit only called for nations to "create profitable work and gainful word related open doors good with nation particular factor enrichments, on a scale adequate to deal with imminent increments in the work compel and to cover overabundances". Plan 21 did, in any case, perceive the significance of the social accomplices among the real partner gatherings; Chapters 29 (labourers) and 30 (managers) set out their individual parts in managing economic advancement issues at the national and working environment levels. It ought to be noted, however, this meagre scope of work issues is to a great extent an impression of the absence of accessible investigation and information at the time concerning the connection amongst business and abilities advancement and feasible improvement. It is additionally clear in the answer to the 1990 International Labour Conference on condition and the universe of work, and the conclusions which concentrate on the connection between the working and the general condition. After the World Summit on Social Development in 2005 embraced full business and nice work as a worldwide objective, and the consequent incorporation of an arrangement of work markers under MDG 1 that the part of conventional work in feasible advancement began to get steady acknowledgment. At the ILO too, the nearby between linkages between the earth and the universe of work began to be progressively recognized. The discourse of the Director General's answer to the 2007 International Labour Conference and the general dialog and conclusions on maintainable ventures strengthened the knowledge that "it is in working environments that the social, monetary and ecological measurements of reasonable advancement meet up indivisibly" and furthermore called for just changes for specialists influenced by financial rebuilding. Uncertain social

difficulties, for example, joblessness (especially among youth), yet in addition training, wellbeing, sanitation and framework, add intricacy to settling ecological difficulties. Working neediness and poor employment quality still influence a huge number of individuals around the globe, while the across the board absence of essential social security builds the defencelessness of many to natural and monetary stuns. In spite of the fact that the ecological and social difficulties may seem overwhelming, tending to them together can prompt positive results and make capable collaborations for advancement. A greener economy, as an approach to accomplish sustainable development, isn't discretionary for maintainable endeavours and labour markets, it is a need. Heightening normal asset utilize and contamination will aggravate the developing shortage of crisp water and fruitful land and quicken the loss of biodiversity and environmental change past middle of the road – maybe even sensible – levels. The abuse of normal assets, for example, woodlands, fish and clean water, and the rising levels of contamination, including discharges of ozone depleting substances (GHGs), are progressively surpassing planetary limits. The harm to economies and to society caused by natural corruption can possibly fix a large number of the increases being developed and neediness lessening accomplished over the previous decades. Areas that are the most debilitated by environmental change, for example, agribusiness, ranger service and fisheries, utilize well finished a billion people. Social and labour policies for a green transition ideally combine social protection; business, aptitudes improvement and dynamic and uninvolved work advertise strategies. Social assurance measures, for example, Ethiopia's Productive Safety Net Program and India's Mahatma Gandhi National Rural Employment Guarantee Scheme reinforce the versatile limits of poor people and give chances to embrace supportable practices. Social assurance likewise bears poor and moved labourers salary security, the likelihood for aptitudes procurement and expanded portability. Compensation of natural administrations can connect focused on access to work chances to significant interests in gainful foundation.

**Conclusion:** To ensure the transition towards a greener and socially inclusive economy, thereby contributing to sustainable development, a comprehensive policy approach is needed. The approach must recognize the country region-specific and sector-specific challenges while ensuring that opportunities for decent work and social inclusion are achieved. Green jobs should be decent, which is regularly especially difficult in occupations in waste management, agriculture and other precarious employment relationships. Thus it is basic that the decent work approach is taken when taking a gander at green jobs. Decent jobs are jobs are occupations which guarantee essential human and labour rights, social protection and the privilege to practice social dialogue for workers.

## FACTORS AFFECTING PREFERENCE OF FOREIGN UNIVERSITIES OF NEPALESE STUDENTS

Alisha Karki

**1. Introduction:** According to DePaul and Hoffa (2010), initial foreign language programs were developed after World War II to encourage students to learn about beliefs and cultures of other countries. Most study abroad programs were connected to language acquisition and international affairs, but often times students studied abroad with no real connection to their degree program. An international university is funded by the governments of many countries and thereby is controlled by the officials from the government of different countries. These universities are often formed by the regional and international organizations. Attitudes and destination image play an important role in the destination choice of individuals. Understanding the process of attitude formation towards competing destinations for this specific tourist segment will contribute to a greater comprehension of an important part of the decision making process (Sirakaya et al., 2001). According to Schnusenberg et al. (2012), there is positive relationship between preferences for foreign study with cultural factors. Therefore cultural factors positively influence the preference of foreign universities. DePaul & Hoffa (2010) revealed that every course and every university is different and each student wants different things. Most study abroad programs were connected to language acquisition and international affairs, but often times students studied abroad with no real connection to their degree program. While the benefits of study abroad programs highlighted by educational institutions are related to education and career, many young students are motivated by nonacademic desires for international travel .Study abroad programs enable students to fulfill their desires for travel through a socially legitimate travel motivation )Jarvis and Peel, 2008(. International students contribute greatly to the existence and operation of the host institution by paying full tuition, especially in the current context when higher education funding is increasingly cut )Gomes et al., 2014 .(Yang (2007) found that one of the pull factors for Mainland Chinese students to choose Australia as the study destination was Australian policies for immigration opportunities upon graduation. This study is supported by recent statistics for the fall and rise of number of students in Australia before and after the commitments of immigration policy in the country. According to Gribble and Blackmore (2012), keeping a stable inflow of international students is also a strategy to sustain the economic development of the host country. Therefore, devising marketing strategies to successfully recruit international students is becoming one of the central goals of many host countries and universities. Phang (2013) analyzed that, it is especially true for higher education (HE) institutions in countries including Sweden that only recently have begun to engage in attracting international students. Existing research shows that the US, UK and Australia are the three major study destination. According to Campbell (2003), curricula initiatives around the country have resulted in substantially greater emphasis on international business issues .One effective way to provide business students with this global perspective is through study-abroad programs Praetzel et al. (1999) revealed that, study abroad programs vary in terms of the duration, objectives, and the time of year offered .And each of these characteristics directly influences the program cost .The more ambitious the program objectives are in terms of travel itineraries, tours, etc .the greater the cost .And programs that are offered during traditional tourist seasons are likely to be substantially more expensive, in terms of air fare and accommodations than program offered during off-peak times. Pigozzi (2003) found that the students had begun to choose to study at prestigious institutions closer to their home .All of the evidence suggests that there are ever changing underlying factors influencing international students 'choice of host country and institution .It is, therefore, necessary

for universities to regularly investigate those factors in order to devise effective marketing strategies to help increase the enrollment of international students. Traditionally, it has been driven by expectations to raise the graduate's economic and social status, especially within the higher education sector. The historical or colonial links between host and home countries has also played a role in determining where students travel for study (Mazzarol and Soutar, 2002).

According to Travis and Bulgacov (2011), students choose their study abroad location based on the quality of education that the foreign country provides as well as the resources other universities offer. The study reveals better destination choice create positive impact on students' future career goals, as well as outside credit for the degree they are pursuing. Career goals and boosting a resume take students to study abroad programs. Beheshti and Bagheri (2010) revealed that universities have transformed from a segregated special-purpose institution into market-oriented and relationship-based entities, which emphasize consumer-centric approach. The study found that cost, reputation of the University make impact on choosing country for international education. Socio-economic factor is positively related with the destination choice of study abroad programs.

According to Germijs et al. (2012), selecting universities creates a mini-cycle which is a part of the whole career development cycle. As well as other decision is also influenced by number of factors. Phang (2013) stated the growing international competition between countries for international students has become increasingly important to gain a better understanding of the factors that influence international students' decision on study destination. Schnusenberg et al. (2012) revealed that financial ability to study abroad as well as social, cultural and personal factor most influence undergraduate decisions to study abroad. Existing literature also analyzed that international students' choice of host country and/or institution is influenced by numerous different factors, heavily dependent on their backgrounds. According to Briggs and Wilson (2007), the key reason for supporting studies in the field of higher education is the concern for effective decision making at all levels. The study found that there is general agreement that it is critically important that applicants are able to make well informed choices.

Kotler and Fox (1995) analyzed that, not everyone will follow all the stages in the information seeking and decision making process and they tend to be influenced by cultural, social and psychological factors so placing the importance of appreciating the context of the student and those that influence him or her. Maringe (2006) found that price-related issues were considered more important than other factors influencing students in the choice of abroad study programs. In the context of Nepal, Katuwal (2011) revealed that higher education is a backbone for an overall development of any nation. The study found that education plays vital role not only in raising political and social consciousness but also in increasing the number of skilled workers and raising the level of trained manpower. The study found positive relationship between education and income level of the students in choosing destination of study abroad programs. The above discussion reveals that there is no consistency in the findings of various studies concerning the studies on preference of foreign universities of Nepalese students. The major objective of the study is to analyze the factors affecting preference of foreign universities of Nepalese students. More specifically, it examines the impact socioeconomic factor, institutional factor, cultural factor and personal factor on preference of foreign universities of Nepalese students. The remainder of this study is organized as follows: Section two describes the sample, data and methodology. Section three presents the empirical results and the final section draws conclusion and discuss the implications of the study findings.

**2. Methodological aspects:** This study is based on primary data which were gathered from the 100 respondents, which mainly deals with the factors affecting preference of foreign universities of Nepalese students.

**The Model:** As a first approximation, this study assumes that preference of foreign universities depends on several dimensions (socioeconomic factor, institutional factor, cultural factor and personal factor). Therefore, the regression model used in this study takes the following form:

Preference of foreign universities =  $f(S, I, C \text{ and } P)$

More specifically,

$$PFU = \beta_0 + \beta_1 S + \beta_2 I + \beta_3 C + \beta_4 P + e_1 \dots \dots \dots (i)$$

**Where,**

S= Socioeconomic factor, I= Institutional factor, C = Cultural factor, P= Personal factor, e= error term and  $\beta_1, \beta_2, \beta_3, \beta_4$  are the beta coefficient of the explanatory variables to be estimated.

**Socio-economic factors:** Socio-economic factors affect preference of foreign study of students in Nepal as socially back warded people or economically deprived ones are observed to be not so participative in foreign studies. According to Maringe (2006), there is positive relationship between preferences for foreign study with socio-economic factors. There is positive impact of socio-economic factor on the preferences for foreign study (Yang, 2007). Likewise, socio-economic factor affects positively on the preferences for foreign study (Gribble and Blackmore, 2012). Based on it, this study develops following hypothesis:

*H1: There is positive relationship between socioeconomic factor and preference of foreign universities of Nepalese students.*

**Institutional factors:** Institutional factors influence the preference of foreign study as basically in terms of institution the teaching methodologies, perception and opinion of people towards foreign study are highly different. According to Hossler et al. (1989), there is positive relationship between preferences for foreign study with institutional factors. There is positive association between preferences for foreign study with institutional factors (Hawthorne et al., 2004). Institutional factor positively influences on the preferences for foreign study (Hemsley-Brown and Oplatka, 2015). Based on it, this study develops following hypothesis:

*H2: There is positive relationship between institutional factor and preference of foreign universities of Nepalese students.*

**Cultural factors:** Cultural factors affect the foreign study choice as basically when students apply for foreign study, they encounter completely different culture and practices that are highly new and challenging to them. According to Schnusenberg et al. (2012), there is positive relationship between preferences for foreign study with cultural factors. Kotler and Fox (1995) revealed that there is positive relationship between preferences for foreign study with cultural factors. Cultural factor has positive effect on preferences for foreign study (Mellors-Bourne et al., 2013). Based on it, this study develops following hypothesis:

*H3: There is positive relationship between cultural factor and preference of foreign universities of Nepalese students.*

**Personal factors:** Personal factors influence foreign study as it involves personal thoughts and believes so what a person believe is good and right will do the same. According to Czarniawska and Genell (2002), there is positive relationship between preferences for foreign study with personal factors. There is positive association between preferences for foreign study with personal factors (Beggs and Wilson, 2007). Based on it, this study develops following hypothesis:

*H4: There is positive relationship between personal factors and preference of foreign universities of Nepalese students.*

### 3. Results and discussion

**Correlation analysis:** The Pearson's correlation coefficients have been computed to analyze the strength of linear relationship between selected factors and preference of foreign universities of Nepalese students and the results are presented in Table 3.1.

**Table 3.1: Pearson's correlation matrix for the preference of foreign universities of Nepalese students**

*This table reveals the Pearson's correlation coefficients between dependent and independent variables. Preference of foreign universities (PFU) is the dependent variable and socio-economic factors (S), institutional factors (I), cultural factors (C), and personal factors (P) are the independent variables.*

Variable	Mean	S.D	S	I	C	P	PFU
S	1.97	0.35	1				
I	1.90	0.42	.163	1			
C	2.18	0.43	.237*	.188	1		
P	2.10	0.41	.181	.392**	.319**	1	
PFU	2.17	0.53	.368**	.22	.346**	.118	1

*Notes: The asterisk signs \*\* and \* indicate that correlation is significant at 1 and 5 percent level respectively.*

The table shows that the average value of socioeconomic factors is 1.97. Likewise, the average value of institutional factors is 1.90. Similarly, average value of cultural factors is 2.18, personal factors is 2.10 and preference of foreign universities is 2.17.

The result shows that there is positive relationship of socioeconomic factors with preference of foreign universities which indicates that stronger the socioeconomic factors, better would be the foreign universities. Likewise, the study observed positive relationship between institutional factors with preference of foreign universities which indicates that stronger the institutional factors, better would be the foreign universities. Similarly, the positive relationship between cultural factors with preference of foreign universities which indicates that stronger the cultural factors, better would be the foreign universities. Also, the study observed positive relationship between personal factors with preference of foreign universities which indicates that stronger the personal factors, better would be the foreign universities.

**Regression analysis:** Having indicated the Pearson correlation coefficients, regression analysis has been conducted and the results are presented in Table 3.2.

**Table 3.2: Regression results of S, I, C and P on Preference of foreign universities of Nepalese students**

*The result are based on pooled cross sectional data and preference of foreign universities with 100 observations of 2017 survey using linear regression model. The model is  $PFU = \beta_0 + \beta_1 S + \beta_2 I + \beta_3 C + \beta_4 P + e_t$ , where, dependent variable is PFU (preference of foreign universities) and independent variables are S (socioeconomic factors), I (institutional factors), C (cultural factors) and P (personal factors).*

Model	Intercept	S	I	C	P	Adj. R <sup>2</sup>	SEE	F
1	1.07	0.56				0.13	0.50	15.38
	(3.73)*	(3.92)*						
2	2.12		0.03			-0.01	0.53	0.05
	(8.44)*		(0.22)					
3	1.23			0.43		0.11	0.50	13.37
	(4.67)*			(3.66)*				
4	1.85				0.15	0.004	0.53	1.40
	(6.69)*				(1.18)			

5	1.14	0.57 (3.92)*	-0.05 (-0.40)			0.12	0.50	7.70
	(3.34)*							
6	1.21			0.43	0.01	0.10	0.50	6.62
	(3.76)*			(3.42)*	(0.08)			
7	0.65	0.48	-0.12	0.36		0.19	0.48	8.67
	(1.77)**	(3.34)*	(-0.89)	(3.05)*				

**Notes:**

1. \*. Results are significant at the 1% level.
2. Figures in parentheses are t-values.
3. Customer satisfaction is dependent variable.

The table shows that the beta coefficient for socioeconomic factors has positive and significant impact on preference of foreign universities. It reveals that better the socioeconomic factors, better would be the preference of foreign universities. This finding is consistent with the findings of Ajzen and Fishbein (1977). Likewise, the finding shows that beta coefficient is positive for institutional factors indicating better the institutional factors, better would be the preference of foreign universities. This finding is consistent with the findings of Ming (2010).

Similarly, results show positive beta coefficients for cultural factors which indicates that cultural factors helps to choose better foreign universities. This finding is consistent with the findings of Hemsley-Brown and Oplatka (2006). Likewise, the results show that beta coefficient for personal factors is positive which indicates better personal factors, better would be the preference of foreign universities. This finding is similar to the findings of Mutairi and Saeid (2016).

**4. Summary and conclusion:** International students have been found to contribute a great deal to their host institution and country in terms of socio-economic and cultural development; as a result. Recruiting international students has become an important strategy for sustaining institutional and national development. Students are being attracted to prefer foreign universities for their higher studies. Thus there are different factors that affect the preference of foreign universities of Nepalese students. The finding lends support to many previous studies that financial cost continuous to be an important factors in students' choice for graduate programs (Wilkins and Huisman, 2013). This study attempts at determining the factors affecting preference of foreign universities of Nepalese students. This study is primarily based on primary sources of data collected from the 100 respondents. This study hypothesizes that the preference of foreign universities depends on several factors such as socioeconomic, institutional, cultural and personal. The correlation analysis shows that socioeconomic factors, institutional factors, cultural factors and personal factors are positively related to preference of foreign universities. It reveals that better the socioeconomic factors and institutional factors, better would be preference of foreign universities. This also indicates that better the cultural factors and personal factors, better would be the preference of foreign universities. The regression analysis shows that socioeconomic factors and institutional factors have positive impact on preference of foreign universities. It reveals that better the socioeconomic factors and institutional factors, better would be the preference of foreign universities. Similarly, cultural factors and personal factors also have positive impact on preference of foreign universities. This indicates that betterment in the socioeconomic factors and institutional factors lead to better preference of foreign universities. It also reveals that betterment in the cultural factors and personal factors leads to better preference of foreign universities.

*Associate Professor, Department of Commerce and Management, VVM's Shree Damodar College of Commerce and Economics, Margao -Goa*

**Introduction:** In view of growing complexities of bank's business and the dynamic operating environment, risk management has become very significant. Risk management process provides reasonable assurance of achieving corporate objectives, such as high level goals, compliance with applicable laws and regulation. These changes greatly affect banks, not only to transform but also envision new business model to reposition them in changed scenario. Each of the major trends driving the banking sector present unique challenges. The efficiency and strength of banking companies depend on their ability to absorb and adjust to ever changing environment as quickly as possible. The success of bank is the function of balance between enhancing profit and managing risk. Risk management also helps in encouragement to firm's specific investment; synchronized interest of management with owners; designing of management compensation plan; reduction in losses and earnings volatility. However, with the passage of time risk management in banks also witnessed a substantial change. The regulations that emerged from the global financial crisis and the fines that were levied in its wake triggered a wave of change in risk functions. These included more detailed and demanding capital, leverage, liquidity, and funding requirements, as well as higher standards for risk reporting, (Phillipe 2015), hence risk management is essential today for compliance of regulation. The study of risk management is also significant because today's banks run its operation with two goals in mind – to generate profit and to stay in the business (Marision 2005), In other words, although avoiding failure is the principal reason for managing risk, financial institution also have broader objective of maximising Risk Adjusted Rate of Return on Capital (RAROC). This means measuring and managing risk relative to returns to capital. According to Abiola and Alayousis (2014) the importance of risk management in banks is because of their effect on financial crisis and determining the role of its survival growth and profitability of bank. Today, banking activity is becoming more complex compounded by exploding technological capabilities, expanding product offered and deregulation of competitions (Pathi and Murthy 2013), and thus banking is business of risk and this demands requirement for risk management. Banks face three types of risk – Credit risk, Market Risk and Operational risk. Among these risk credit risk is most important because it has substantial effect on the return on investment of the bank. According to Ngoroge and Ngahu (2017) Credit risk is a big threat for banks as the value of any organization is measured by its credit worthiness. Therefore, credit risk management is of critical importance for the good performance of banks. Credit risk management practices is an issue of concern in financial institutions today and there is need to develop improved processes and systems to deliver better visibility into future performance (Gakhure and Waithaka 2012). Present paper is thus designed to understand the credit risk management practices followed by Indian banking sector.

**2. Theoretical Exposition and Review of Literature:** Derban, Binner and Mullineux (2005) recommended that borrowers should be screened especially by banking institutions in form of credit assessment. Collection of reliable information from prospective borrowers becomes critical in accomplishing effective screening as indicated by symmetric information theory. Qualitative and quantitative techniques can be used in assessing the borrowers although one major challenge of using

qualitative models is their subjective nature. However according to Derban, Binner and Mullineux (2005), borrowers attributes assessed through qualitative models can be assigned numbers with the sum of the values compared to a threshold. This technique minimizes processing costs, reduces subjective judgments and possible biases (Gakure and Waithaka, 2012) A more interesting alternative was the Arbitrage Pricing Theory (APT) of Ross (1976). Stephen Ross's APT approach moved away from the risk vs. return logic of the CAPM, and exploited the notion of pricing by arbitrage to its fullest possible extent. As Ross himself has noted, arbitrage-theoretic reasoning is not unique to his particular theory but is in fact the underlying logic and methodology of virtually all of finance theory. (Gakure and Waithaka, 2012) This theory subscribes to the fact that an estimate of the benefits of diversification would require that practitioners calculate the covariance of returns between every pair of assets. In their Capital Asset Pricing Model (CAPM), Morris (2001) solved this practical difficulty by demonstrating that one could achieve the same result merely by calculating the covariance of every asset with respect to a general market index. With the necessary calculating power reduced to computing these far fewer terms (betas), optimal portfolio selection became computationally feasible. Diksha and Arora (2009) critically examined the current risk management practices of three banks. Primary and secondary data was used to collect data. Research concludes that most of the banks do not have risk management team, policy, procedure and framework in place and banks to come up with transparent and appropriate corporate governance structure. However study did not revealed the implications of RBI norms on risk management practices in Indian banks. Bodla and Verma (2009) conducted study on credit risk management framework at Banks in India and concluded that Good risk management is good banking which ultimately lead to profitable survival of the institution. Kumar, and et. (2011), in his studies developed a Credit Risk management (CRM) index score. The idea behind study is CRM index will act as a benchmark for CRM practices. The proposed CRM index was tested on 33 public and private banks to judge its validity. His study further used co-relation analysis between CRM index score and NPA ratio. The result shows close exposure between CRM index and Credit risk exposure. Also, to test the reliability of index regression analysis was carried- result shows increase in the CRM index score leads to decrease in the value of NPA ratio. Nandi and Chaudhary (2011) examined the empirical evidence of Credit Risk Management of Loan Portfolios by Indian Banks and established an internal credit rating model for banks which improves their credit current predictive power of financial risk factor with the help of Altman Z-score model and Multivariate Discriminate Analysis. In his study current ratio is used as indicator to depict the financial health; however it cannot be taken as sole criteria to judge the financial health of banks. Kattel (2016), in his paper found the significant difference of mean value of credit risk tools and techniques of private and joint venture banks. One way ANNOVA has been used to see the difference between private banks and joint venture banks in usage of tools and techniques such as Matrix method, Internal Judgment, standard approach, Causal method VAR linear probability, and linear Discriminant analysis. There found a significant difference of mean value of credit risk tools and techniques in private and joint venture banks. Most of the studies have focused on credit risk and its management, however very few studies are available on credit risk management practices. Though some studies do available covering a small size of three to four banks, there is need to do study on more sample size. Ample literature is available covering data period of three to five years. Literature need to be developed covering a data period of more than five years. Some of the studies focused on development and testing of CRM index in Indian banks, so country specific characteristics might restrict the generalization of construct for index.

**3. Objectives and Methodology :** Credit risk management practices is found an issue of concern in financial institutions today and there is need to develop improved processes and systems to deliver better visibility into future performance (Gakure, 2012). In this context the present paper is designed to understand the credit risk management practices followed by Indian banking sector Population comprises

of 69 banks present in Goa. A sample of 30 banks from Bardez and Tiswadi Taluka from Goa were selected. Systematic Random Sampling Method is used to select sample a survey of 10 public sector banks, 10 private banks and 10 Co-operative banks were conducted. A structured questionnaire and personal interview was administered for data collection. The information so gathered is presented in tabular form and in graphical format. The present study was carried out in the period from October 2013 - February 2014. Since the objective of the survey was to understand the risk management practices followed by banks, hence questions were asked on different aspects of credit risk. Bank managers of different branches were interviewed. Credit risk is potential that a bank borrower fails to meet the obligation on agreed terms. Credit risk is defined as the possibility of losses associated with diminution in the credit quality of borrowers or counterparties. It is critical since the default of a small number of important customers can generate large losses. Alternatively, losses result from reduction in portfolio value arising from actual or perceived deterioration in credit quality. Following are some of the tools used for evaluation of Credit Risk:

**Exposure Ceilings:** Under this instrument Prudential limit is linked to capital funds – Say 15% for individual borrower, 40% for group with additional 10% for infrastructure project undertaken by the group.

Revival/Renewal: Multi- tier Credit Approving Authority, Constitution wise delegation of powers, higher delegated power for better customers,

**Risk Rating model:** set up comprehensive risk scoring system on a six to nine point scale. Clearly define rating thresholds and review the ratings periodically preferably at half yearly interval. Rating migration is to be mapped to estimate the expected loss.

Risk Based Scientific pricing: Link loan pricing to expected losses

Credit Portfolio management: it involves distribution of borrowers to various industry, business groups and rapid portfolios reviews

**Loan Review mechanism:** It is referred as Credit Audit covering review of sanction process, compliance status, review of risk rating with the objective of improving credit quality.

The liberalization of the Indian economy has brought about sweeping changes in the economic environment and has induced new anticipated and unforeseen risk in lending. The assessment of this risk is essential to facilitate prudent credit decision. The RBI has issued guidelines to all banks to have proper credit risk management in place. Credit risk measurement techniques are econometric technique neural network, Optimization model, rule based and hybrid system- Models covering techniques are- Altman's-Z score model, KMV model, Credit metrics etc.

**4 Results and Discussion:** The Present study is based on the observation of 30 Indian Commercial banks operating in India. From the analysis it is learned that Public banks take more precaution or follow all the criteria before granting loan also, all the banks from sample face credit risk. It can be said that credit risk is inherent limitation of the banks. It was also observed that all the banks from sample makes credit risk policy and have credit risk management committee in place.

**A. Types of risk faced by bank:** In Financial sector, especially the banking industry is passing through process of change. These change led banks to encounter various types of financial and non financial risk. The main three categories of risk that appear in banking parlance are credit risk, Market risk and operational risk. Survey results shows that, the Public and the Private sector banks on an average demonstrate a higher awareness of the three main risks faced by the banking industry. The localized character of the Cooperative banks, not-so professional management reflect in the lack of general awareness by the banks in the cooperative sector compared to their public and private sector counterparts. Interestingly, all the managers in the sample show greater awareness about the extent of credit risk faced by them. Thus due to increase NPA's in banks, lending risks are greatly perceived in the banking industry.

Since all the banks in the sample face credit risk, it can be said that credit risk is the inherent limitation of the banks. Hence it is crucial for the banks to monitor and manage this risk to avoid liquidation of banks. It is observed that the all banks demonstrate less awareness about Interest rate risks, compared to other 2 types of risks. It may be due to fact that IRR can increase or decrease without outward signs and such changes can cause failure. At the same time, regulators and banks can monitor it and detect changes; finally banks can take preventive steps to manage it.

**Table 1 Types of risks**

Banks	Credit risk	Interest rate risk	Operational risk
Public	100%	60%	70%
Private	100%	50%	80%
Co-operative	100%	30%	50%

### **B Presence of Credit Risk Management Committees and Policy**

It is vital for the banks to have Credit Risk Management committee in place to implement credit risk policy approved by the board, to monitor credit risk and to ensure compliance with limits approved by the board. Survey results shows that all 30 banks in the given sample have formed a credit risk management committee and have a credit risk policy in place. It is important to make credit risk policy as it defines the target markets, risk acceptance criteria, credit origination procedures etc. Credit risk policy document also includes risk identification, risk measurement and risk grading techniques.

**Table 2 Presence of credit risk management committee and credit risk policy in banks**

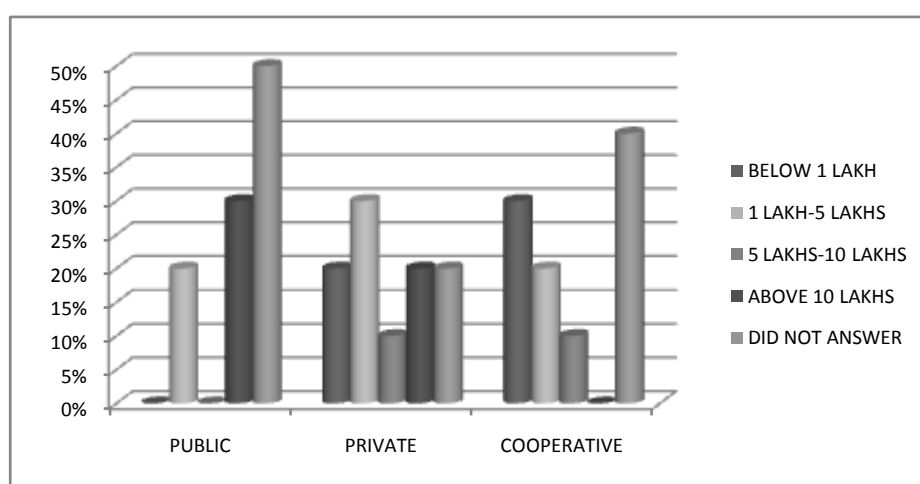

Banks	Yes	No
Public	100%	0%
Private	100%	0%
Cooperative	100%	0%

**C Use of Credit Rating Tools:** Credit risk rating is a rating assigned to borrowers, based on an analysis of their ability and willingness to repay the debt taken from the bank. Credit risk rating tool has been developed with a view to provide standard system for assigning a credit risk rating to the borrowers of the banks according to their risk profile. The tool evaluates the credit risk rating of a borrower on a scale of AAA to D with indicating AAA minimum risk and D indicating maximum risk. Better the rating lower is the probability of default. The rating tool can be focused on areas such as –Quality of management, Business performance, Financial Projection, Industry Outlook etc. The banks may use any number of financial ratios and operational parameters and collaterals and industry characteristics that have bearings on creditworthiness of borrowers. Survey results shows that all of the public and private sector banks from the selected sample follow credit rating tool whereas only 40% of cooperative sector banks do not follow rating tools. However on enquiry it was found that our entire sample checks the creditworthiness of the borrower before giving credit. Creditworthiness of the borrower is required to be checked so that the loan given to the borrower is repaid on time. If the bank fails to check the creditworthiness of the borrower it may suffer the risk of default. Certain Co-operative banks still follows primitive method of working. It is observed that staff of Co-operative banks is not aware about the modern tools for rating creditworthiness of borrower as a precautionary measure before granting loan. Cooperative banks need to follow rating tools before giving credit to avoid the risk of default

**Table 3 Follow of credit rating tools**

Banks	Yes	No
Public	100%	0%
Private	100%	0%
Cooperative	60%	40%

**D Quantum of Loss Suffered due to Credit Risk :** The following bar diagram presents the quantum of loss suffered due to credit risk in banks. It is depicted that 30% of public sector banks suffer a loss above 10 lakhs whereas only 10% of Private sector banks suffer a loss in between 5-10 lakhs. In cooperative sector 30% of the banks suffer a loss below 1 lakhs. New and private banks, with their high capital adequacy ratio and better Information Technology and other modern financial skills of personnel are well placed to manage credit risk (Diksha and Arora, 2009). Public sector units although dominant banks in Indian financial system face a challenge in managing credit risk. Hence some of the respondent shows no response as it shows that they are not aware / may not have calculated / or do not want to disclose the quantum of loss suffered by them. In order to control the loss suffered due to credit risk the banks should take appropriate steps such as strict compliance to RBI norms, Better credit risk management, Implementation of integrated, quantitative credit risk solution (Better model, Data visualization capabilities, Stress testing) etc.

**E Criteria followed before Grant of Loan:** Every bank follows some preliminary steps before grant of loan. Some bank may follow lengthy procedure, whereas some may follow one step before grant of loan. Survey result in table 5 depicts that small portion i.e. 20% of public sector banks checks integrity before granting loan to borrower and most of them that is, 60% of the private sector banks checks track record before granting loan to borrower whereas none of the public and cooperative sector banks checks personal guarantee as a sole factor for granting loan.

It is also found that Public and co-operative banks do not rely only on one factor- that is personal guarantee before granting loan. It is also observed that most of the public sector banks are on the precautionary side that follows all three factors simultaneously before granting loan. However, private banks follow one factor individually before grant of loan as they may take risk for customer retention.

**Table 4 criteria followed before grant of loan**

Particulars	Frequency Public Banks	Frequency Private Banks	Frequency Cooperative Banks
Integrity Check	2	3	3
Track record Check	3	6	4
Insist on Personal Guarantee	0	1	0
All of the above	5	0	3

**Conclusions:** The present study was undertaken to understand the different credit risk management practices followed by banks. To achieve this purpose data was collected on majority type of risk faced by select banks and understand the credit risk management tools and policies followed by banks. It also

studies how a bank assesses the creditworthiness of their borrowers and the amount of loss suffered due to credit risk. From the analysis it is learned that, the Public and the Private sector banks on an average demonstrate a higher awareness of the three main risks faced by the banking industry. However due to localize character of the Cooperative banks, not-so professional management reflects lack of general awareness on the type of risk faced by them. It is also found from the survey conducted; that all banks from sample, face credit risk, hence banks should apply risk management tools and technique to control credit risk. Results also shows that, compared to operational and interest rate risk, there is increased awareness of credit risk among the banks. Hence all the banks from sample have credit risk management committee and follow credit risk policy, and checks creditworthiness of borrower, however some of the co-operative banks are not following rating tool before granting loan. It is suggested that to cooperative to undertake precautionary measure before granting loan. It has been observed that public sector banks are major victim for credit risk as they suffer loss of 10 lakhs per year due to credit risk; hence they should take appropriate measure to reduce this loss in future. All the banks also take reasonable steps to measure the creditworthiness of the borrower. Present study covers sample of 30 banks, however it can be extended to more number of banks. Study can be further extended to understand models followed by bank for credit risk measurement

## INDIAN AGRICULTURAL SUSTAINABILITY AND FARMERS LIVELIHOOD

Dr. Manasvi Kamat<sup>1</sup> & Gounder Rajendra<sup>2</sup>

<sup>1</sup>Associate Professor in Economics, Shree Sateri Pissani Education Society's, Shri Gopal Gaonkar Memorial, Goa Multi - Faculty College, Dharbandora - 403 406, Goa, India. <sup>2</sup>Assistant Professor in Economics, Shree Sateri Pissani Education Society's, Shri Gopal Gaonkar Memorial, Goa Multi - Faculty College, Dharbandora - 403 406, Goa, India.

**Introduction:** Agriculture plays a vital role in India's economy. Agriculture in India has an extensive background which goes back to ten thousand years. At present, India holds the second position in the world in agricultural production. It also contributes a major share in the Gross Domestic Product (GDP) of the country. In addition, the sector recruits about over 58 per cent entire manpower of the rural households who depend on agriculture as their principal means of livelihood. Agriculture, along with fisheries and forestry, is one of the largest contributors to the Gross Domestic Product (GDP). As per estimates by the Central Statistics Office (CSO), the share of agriculture and allied sectors (including agriculture, livestock, forestry and fishery) was 16.1 per cent of the Gross Value Added (GVA) during 2014–15 at 2011–12 prices. During Q1 FY2016, agriculture and allied sectors grew 1.9 per cent year-on-year and contributed 14.2 per cent of GVA. Regardless of the fact that there has been a gradual slump in its contribution to GDP of the country, agriculture is currently the biggest industry in India. On the whole, it plays a key role in the socioeconomic growth of the country.

### Objectives:

1. To list out ranking of agricultural products.
2. To glance Share of Agriculture in Gross State Domestic Product.
3. To list major investments and developments in agriculture.
4. To list major government initiatives in the Agricultural sector.

**Review of literature:** Agriculture sector is the mainstay of the Indian economy, contributing about 15 per cent of national Gross Domestic Product (GDP) and more importantly, about half of India's population is wholly or significantly dependent on agriculture and allied activities for their livelihood (GOI, 2011). ..... agriculture remains a major source of employment, absorbing about 52 percent of the total national work-force in 2004-05, down from about 70 percent in 1971 (Vijay Paul Sharma 2011).

**Around the turn of the century, India overtook the United States as the world's largest producer of milk and is also a major producer of pulses, such as chickpeas and lentils, which are major sources of protein in vegetarian diets. in agricultural production boosted rural incomes (Adam Cagliarini and Anthony Rush 2011).**

The ToT for farmers and the agriculture sector rose significantly during the period 2004–05 to 2013–14, though they stagnated after 2010–11. The ToT for agriculture rose much faster than for farmers. The sector's fortunes will hinge more on its links with other sectors as well as on people moving from agriculture to higher productivity employment in non-agriculture, as increasingly non-farm incomes are forming higher proportions of incomes for the farm sector (Mahendra Dev, N Chandrasekhara Rao 2015).

### Agricultural Products in India:

India is one of the fastest growing economies of the world and is currently the focus of a great deal of international attention. In terms of agriculture some of the issues are as follows:

- India ranks first in producing the following agricultural outputs: Anise, Fresh fruit, Badian, Fennel, Tropical fresh fruit, Coriander, Pigeon peas, Jute, Spices, Pulses, Castor oil seed, Millets, Safflower

seeds, Sesame seeds, Limes, Lemons, Dry chillies and peppers, Cow's milk, Cashew nuts, Chickpeas, Ginger, Okra, Guavas, Turmeric, Goat milk, Mangoes, Meat and Buffalo milk.

- In addition, the country also ranks as the top producer of millets such as Bajra, Jowar, and Ragi. In terms of rice production, India holds the second position after China.
- India produces about 10% of the fruits produced in the world. The country holds the first position in the world in producing the following fruits: Papaya, Mangoes, Sapota and Banana.
- India also holds a high rank in the world in the production of the following: Sorghum, Tobacco, Coconuts, Rapeseed, Tomatoes and Hen's eggs.
- India ranks sixth in the world in the production of coffee. India has the biggest number of livestock in the world. India also ranks high as the producer of the following: Cabbages, Cashews, Fresh vegetables, Cotton seed and lint, Brinjal, Garlic, Silk, Goat meat, Cardamom, Nutmeg and Mace, Wheat, Onions, Sugarcane, Rice, Dry beans, Lentil, Tea, Groundnut, Cauliflowers, Green peas, Pumpkins, Potatoes, Gourds, Squashes and Inland fish
- The population of India is increasing at a faster pace than its capacity to produce wheat and rice.
- India holds the second position in the production of wheat, rice, cotton, sugarcane, and groundnuts. It is also the second biggest harvester of vegetables and fruits, representing about 9% and 10% of the overall vegetable and fruit production in the world respectively.
- The country is the top producer of jute, milk, and pulses and holds the second rank in the production of silk and is also the biggest consumer of silk in the world.

Below shown tables may further highlight idea of the status of agriculture in India. Table-1 shows All-India Index Number of Production of Principal Crops based on year 2007-08.

**Table 1: All-India Index Number of Production of Principal Crops**

(TE: 2007-08=100)

Crops	2007-08	2008-09	2009-10	2010-11	2011-12	2012-13	2013-14	Average Growth during 2007-08 to 2013-14

**Market Size:** Over the recent past, multiple factors have worked together to facilitate growth in the agriculture sector in India. These include growth in household income and consumption, expansion in the food processing sector and increase in agricultural exports. Rising private participation in Indian agriculture, growing organic farming and use of information technology are some of the key trends in the

agriculture industry. As per the 4th Advance Estimates, food grain production is estimated at 252.68 million tonnes (MT) for 2014-15. Production of pulses estimated at 17.20 million tonnes. With an annual output of 138 MT, India is the largest producer of milk. It also has the largest bovine population. India is the largest importer of pulses at 19.0 MT and 3.4 MT, respectively. India, the second-largest producer of sugar, accounts for 14 per cent of the global output. It is the sixth-largest exporter of sugar, accounting for 2.76 per cent of the global exports. India is the largest producer, consumer and exporter of spices and spice products. Spice exports from India are expected to reach US\$ 3 billion by 2016–17 due to creative marketing strategies, innovative packaging, strength in quality and strong distribution networks. The spices market in India is valued at Rs 40,000 crore (US\$ 6.16 billion) annually, of which the branded segment accounts for 15 per cent. The procurement target for rice during marketing season (MS) 2015–16 has been finalised as 30 MT. Agricultural export constitutes 10 per cent of the country's exports and is the fourth-largest exported principal commodity. The agro industry in India is divided into several sub segments such as canned, dairy, processed, frozen food to fisheries, meat, poultry, and food grains.

**Investments:** In terms of agricultural contribution, some of the most developed states in India are Punjab, Uttar Pradesh, Madhya Pradesh, Haryana, Bihar, Andhra Pradesh, Maharashtra, West Bengal and Gujarat play a key role in the agrarian development of India. The total arable territory in India is 15,73,50,000 km<sup>2</sup>, which represents about 52.92% of the overall land zone of the country. Arable land in India is diminishing because of continuous strain from an ever-increasing number of inhabitants and growing urbanisation. Several players have invested in the agricultural sector in India, mainly driven by the government's initiatives and schemes. According to the Department of Industrial Policy and Promotion (DIPP), the Indian agricultural services and agricultural machinery sectors have cumulatively attracted foreign direct investment (FDI) equity inflow of about US\$ 2,182 million from April 2000 to June 2015. Some major investments and developments in agriculture in the recent past are as follows:

- Mahindra & Mahindra (M&M), India's leading tractor and utility vehicle manufacturer, announced its entry into pulses retailing under the brand 'NuPro'. Going forward, the company plans to foray into e-retailing and sale of dairy products.
- Fertilizer cooperative IFFCO launched a joint venture with Japanese firm Mitsubishi Corp for manufacturing agrochemicals in India.
- Acumen, a not-for-profit global venture fund, has invested Rs 11 crore (US\$ 1.7 million) in Sahayog Dairy, an integrated entity in the segment, based at Harda district in Madhya Pradesh.
- Rabo Equity Advisors, the private equity arm of Netherlands-based Rabo Group, raised US\$ 100 million for the first close of its second fund – India Agri Business Fund II. The fund plans to invest US\$ 15–17 million in 10–12 companies.
- Oman India Joint Investment Fund (OIJIF), a joint venture (JV) between the State Bank of India (SBI) and State General Reserve Fund (SGRF), invested Rs 95 crore (US\$ 14.62 million) in GSP Crop Science, a Gujarat-based agrochemicals company.
- The world's seventh-largest agrochemicals firm, Israel-based ADAMA Agrochemicals plans to invest at least US\$ 50 million in India over the next three years.
- Belgium-based Univeg has collaborated with Mahindra & Mahindra to develop a fresh fruit supply chain.
- Companies from the US, Canada, Australia, Israel, the Netherlands and other European countries have shown strong interest to transfer the best practices, linkages between scientific institutes, agriculture storage, cold-chain management, market access, and productivity enhancement such as the introduction of new technology in seed and plant biotech.

- Canada-based International Food Security Research Fund has major investments in food security research in several Indian universities. These strengthen food-processing and sustainable agricultural techniques.

#### **Government Initiatives:**

In order to keep up the momentum gained during the 11<sup>th</sup> Plan and achieve the targeted growth rate of 4% during the 12<sup>th</sup> Five Year Plan as also to ensure focused approach and to avoid overlap, all the ongoing 51 schemes of the Department have been restructured into five missions viz.

- National Food Security Mission (NFSM),
- Mission for Integrated Development of Horticulture Mission (MIDH),
- National Mission on Oil Seed and Oil Palm (NMOOP),
- National Mission for Sustainable Agriculture (NMSA), and
- National Mission on Agricultural Extension & Technology (NMAET);

#### **Five Central Sector Schemes and one State Plan Scheme viz.**

- National Crop Insurance Programme (NCIP),
- Integrated Scheme on Agri-Census & Statistics (ISAC&S),
- Integrated Scheme of Agriculture Marketing (ISAM),
- Integrated Scheme of Agriculture Cooperation (ISAC) and
- Secretariat Economic Service;
- RashtriyaKrishiVikasYojana (State Plan Scheme)

Recognizing the importance of Agriculture Sector, the Government during the budget 2014-15 took a number of steps for sustainable development of Agriculture. These steps include:

- Enhanced institutional credit to farmers;
- Promotion of scientific warehousing infrastructure including cold storages and cold chains in the country for increasing shelf life of agricultural produce;
- Improved access to irrigation through Pradhan MantriKrishiSichayeeYojana;
- Provision of Price Stabilisation Fund to mitigate price volatility in agricultural produce;
- Mission mode scheme for Soil Health Card;
- Setting up of Agri-tech Infrastructure fund for making farming competitive and profitable;
- Provide institutional finance to joint farming groups of “BhoomiHeenKisan” through NABARD;
- Development of indigenous cattle breeds and promoting inland fisheries and other non-farm activities to supplement the income of farmers.

Central Government recognizes and discharges its responsibility to assist State Governments in overall development of Agriculture sector. Effective policy measures are in position to improve agricultural production and productivity and address problems of farmers. State Governments are also impressed upon to allocate adequate funds for development of agriculture sector in State plan, as well as initiate other measures required for achieving targeted agricultural growth rate and address problem of farmers. Given the importance of the agriculture sector, the Government of India, in its Budget 2015–16, planned several steps for the sustainable development of agriculture. The government has already taken steps to address two major factors (soil and water) critical to improve agriculture production. Steps have been taken to improve soil fertility on a sustainable basis through the soil health card scheme and to support the organic farming scheme ‘ParamparagatKrishiVikasYojana’. Other steps include improved access to irrigation through ‘Pradhanmantri Gram SinchaiYojana’; enhanced water efficiency through ‘Per Drop More Crop’; continued support to Mahatma Gandhi National Rural Employment Guarantee Act (MGNREGA) and the creation of a unified national agriculture market to boost the incomes of farmers. The Government of India recognises the importance of microirrigation, watershed development and

‘Pradhan MantriKrishiSinchai Yojana’; thus, it allocated a sum of Rs 5,300 crore (US\$ 815 million) for it. It urged the states to focus on this key sector. The state governments are compelled to allocate adequate funds to develop the agriculture sector, take measures to achieve the targeted agricultural growth rate and address the problems of farmers. The Department of Agriculture and Cooperation under the Ministry of Agriculture has inked MOUs/agreements with 52 countries including the US. In addition, the Department of Agriculture Research & Education (DARE) and the Department of Animal Husbandry, Dairying & Fisheries (DAHD&F) under the Ministry of Agriculture have signed MOUs/agreements with other countries, taking the number of partnerships with other countries to 63. These agreements would provide better agricultural facilities in areas such as research and development, capacity building, germ-plasm exchange, post-harvest management, value addition/food processing, plant protection, animal husbandry, dairy and fisheries. The agreements could help enhance bilateral trade as well. Given the correlation between improvement in agriculture and the development of the country, the Government of India adopted several initiatives and programmes to ensure continuous growth. It allocated Rs 25,000 crore (US\$ 3.9 billion) for the Rural Infrastructure Development Fund (RIFD), Rs 1,500 crore (US\$ 231 million) for the long-term rural credit fund, Rs 45,000 crore (US\$ 6.93 billion) for the short-term cooperative rural credit finance fund and Rs 25,000 crore (US\$ 3.85 billion) for the short-term Regional rural bank (RRB) refinance fund. It also marked an ambitious target of Rs 8.5 lakh crore (US\$ 130.9 billion) of agriculture credit during 2015–16.

Some of the recent major government initiatives in the sector are as follows:

- India and Lithuania have agreed to intensify agricultural cooperation, especially in sectors like food and dairy processing.
- Gujarat Government has planned to connect 26 Agricultural Produce Market Committees (APMCs) via electronic market platform, under the National Agriculture Market (NAM) initiative.
- The State Government of Telangana plans to spend Rs 81,000 crore (US\$ 12.1 billion) over the next three years to complete ongoing irrigation projects and also undertake two new projects for lifting water from the Godavari and Krishna river.
- The National Dairy Development Board (NDDB) announced 42 dairy projects with a financial outlay of Rs 221 crore (US\$ 34.02 million) to boost milk output and increase per animal production of milk.
- The government planned to invest Rs 50,000 crore (US\$ 7.7 billion) to revive four fertiliser plants and set up two plants to produce farm nutrients.
- The Ministry of Food Processing Industries took some new initiatives to develop the food-processing sector that would enhance the income of farmers and export of agro and processed foods, among others.
- The Government of Telangana allocated Rs 4,250 crore (US\$ 654 million) for the first phase of the farm loan waiver scheme. The scheme is expected to benefit 3.6 million farmers who took loans of Rs 100,000 (~US\$ 1,539) or below before March 31, 2014.

**Need for attention:** There are certain salient features of agriculture in India and is correlated with each other. Some of these are Subsistence farming, Heavy Pressure of Population on Agriculture, Non adoption of Mechanised Farming, Traditional Methods of farming, Variety of Crops, Predominance of Food Crops, Seasonal Patterns. There are certain multidimensional problems and challenges faced by the agriculture sector in India which needs attention from different angles and need to be corrected immediately. Some of these are long-standing and some are emerging due to the ongoing agricultural practices. Some such problems are Stagnation in Production of Major Crops, Soil Exhaustion, Decrease in Fresh Ground Water, Unadoptable and Costly Farm Inputs, Unorganized Agricultural Marketing, Lack of Storage Facilities, Bad Effect of Global Climate Change, Farmer Suicides.

**Road Ahead:** The agriculture sector in India is expected to generate better momentum in the next few years due to increased investments in agricultural infrastructure such as irrigation facilities, warehousing and cold storage. Factors such as reduced transaction costs and time, improved port gate management and better fiscal incentives would contribute to the sector's growth. Furthermore, the growing use of genetically modified crops will likely improve the yield for Indian farmers. The 12th Five-Year Plan estimates the foodgrains storage capacity to expand to 35 MT. Also, a 4 per cent growth would help restructure the agriculture sector in India in the next few years.

**Conclusion:** Agriculture occupies a prominent position in Indian policy-making not only because of its contribution to GDP but also because of the large proportion of the population that is dependent on the sector for its livelihood. However, it is clear that India's agricultural sector has made huge strides in developing its potential. The green revolution massively increased the production of vital food grains and introduced technological innovations into agriculture. This progress is manifested in India's net trade position. Where once India had to depend on imports to feed its people, since 1990 it is a net exporter of agri-food products. Its agriculture is large and diverse and its sheer size means that even slight changes in its trade have significant effects on world agricultural markets. But to strengthen agriculture, India still needs to clear problems and challenges faced by the agriculture sector in India immediately.

**Introduction:** Agriculture plays a significant role in India's economy. More than 58 per cent of the rural household's livelihood depend totally on agriculture as their principal means. Adding fisheries and forestry with agriculture is one of the largest contributors to the Gross Domestic Product (GDP). Not only statistics witnesses the importance of agriculture but the farmers from rural households put lots of effort to cultivate and create market surplus and further India could be able to export more than what she imports. As per the Central Statistics Office (CSO) estimates, the share of agriculture and allied sectors (including agriculture, livestock, forestry and fishery) was 16.1 per cent of the Gross Value Added (GVA) during 2014–15 at 2011–12 prices. During Q1 FY2016, agriculture and allied sectors grew 1.9 per cent year-on-year and contributed 14.2 per cent of GVA. Significantly to tell India is the largest producer, consumer and exporter of spices and spice products. The Department of Agriculture and Cooperation under the Ministry of Agriculture is responsible for the development of the agriculture sector in India. It manages several other bodies, such as the National Dairy Development Board (NDDB), to develop other allied agricultural sectors. The agriculture sector in India is expected to generate better momentum in the next few years due to increased investments in agricultural infrastructure such as irrigation facilities, warehousing and cold storage. Factors such as reduced transaction costs and time, improved port gate management and better fiscal incentives would contribute to the sector's growth. Furthermore, the growing use of genetically modified crops will likely improve the yield for Indian farmers.

### **Objectives:**

1. To discuss and estimate Gross Domestic Product (GDP) by Economic Activity
2. To highlight and estimate All India Area, Production and Yield of Food grains along with Coverage under Irrigation
3. To compare and estimate India's Imports and Exports of Agricultural Commodities
4. To discuss and estimate Flow of Institutional Credit to Agriculture Sector

### **Methodology:**

This study is based on secondary data collected from various reports for the period from 2004-05 to 2013-14 and attempted to forecast also for the year 2014-15 to 2019-20.

### **Limitation:**

The study is based on only four concepts but there are several other variables which also determine the status of agriculture.

**Discussion:** The growth in Indian agricultural sector has had its moments of glory, nonetheless. Green Revolution (Pioneering work by agriculture scientists and the efforts of farmers, popularly known as the "Green Revolution", had helped achieve a breakthrough in the agriculture sector in the 1960) has been the major success story of free India. The nation that was frequently plagued by famines and chronic food shortage before green revolution, today faces surplus. From a food grain production around 55 million tons at the time of independence, we now boast of production of about 260 million tons of food grain. Unlike developed nations, agriculture still remains the backbone of our country.

Since past two decades India witnessed sufficient progress in the agricultural sector. To flash on this the study attempted to estimate till 2020 by considering present status of technology adopted in the agriculture. The variables taken to measure the agricultural status are Gross 1) Domestic Product (GDP) by Economic Activity, 2) All India Area, Production and Yield of Food grains along with Coverage under Irrigation, 3) India's Imports and Exports of Agricultural Commodities and 4) Flow of Institutional Credit to Agriculture Sector.

#### A. Gross Domestic Product (GDP) by Economic Activity:

Indian agriculture has witnessed wide variations in growth performance during a span of six decades after independence. A significant recovery of growth was observed in the last few years that has pushed the decadal growth rates above 3 per cent. Year 2013-14 was an exceptionally good year for agriculture in India as several crops witnessed record production. The Table no. 1 clearly states that Agriculture, forestry & fishing shows rising trends and even estimates is also rising.

**Table: 1 Gross Domestic Product (GDP) by Economic Activity at 2004-05 Prices**

(Rs Crores)

Year	Agriculture, forestry & fishing	% y-o-y Growth	Agriculture	% y-o-y Growth	Forestry and logging	% y-o-y Growth	Fishing	% y-o-y Growth

Average 2004-2014		3.97		3.92		2.20		4.95

Source: Central Statistics Office.

Note: 2004-05 to 2013-14 is actual data and 2014-15 to 2019-20 is Estimated value

The outcome is seen in the acceleration in GDP growth in every segment of agriculture and allied activities (Table 1). While the average growth during the decade 2004-2014 was 3.97%. It is significant that there has not been a single year with negative growth in this ten-year period. Second, while “fishing” scored the highest average growth of 4.95%, it is probably livestock that scored the second best. The average growth of agriculture is 3.92%, with fluctuating growth. The only year 2008-09 shows negative growth but not worse yet.

#### **B. All India Area, Production and Yield of Food grains along with Coverage under Irrigation**

During the 11<sup>th</sup> and 12<sup>th</sup> Plan, the yields of all the major crops have recorded positive growth. Impressive rates of growth (more than 4 percent per annum) in production were observed in the case of wheat, bajra, maize, coarse cereals, gram, tur, total pulses, groundnut, sesamum, soyabean, total oilseeds and cotton. The increases in production in the case of wheat, bajra, maize, groundnut and total oilseeds can mainly be attributed to increase in yields, whereas the growth in production in the case of gram, tur, total pulses, soyabean and cotton was driven by a combination of both expansions in area and increase in productivity/yield. A perusal of the rates of growth in yield reveals that most of the crops have recorded higher growth during the 11<sup>th</sup> and 12<sup>th</sup> Plan than that during the 10<sup>th</sup> Plan. The Table No 2 states Area, Production Yield,

Area Under Irrigation. Regarding Area and Area Under Irrigation.

**Table: 2 All India Area, Production and Yield of Food grains along with Coverage under Irrigation**

Year	Area(Million Hectares)	% y-o-y Growth	Production(Million Tonnes)	% y-o-y Growth	Yield(Kg/Hectare)	% y-o-y Growth	Area Under Irrigation (%)	% y-o-y Growth

Source: Directorate of Economics and Statistics, Department of Agriculture and Cooperation.

Note: 2004-05 to 2013-14 is actual data and 2014-15 to 2019-20 is Estimated value.

All India Area, Production and Yield of Food grains along with Coverage under Irrigation is seen in the (Table 2). While the average growth in the area cultivated during the decade 2004-2014 was 0.57%, though it is static but due to mechanization and green revolution, production and yield is rising, growth in this ten-year period was 3.38% and 2.79%. Year 2010-11 was a good year where we can see highest growth in respect of production and yield.

**C) India's Imports and Exports of Agricultural Commodities:** India ranks third in farm and agriculture outputs. Agricultural export constitutes around 10 per cent of the country's exports and is the fourth-largest exported principal commodity. The agro industry in India is divided into several sub segments such as canned, dairy, processed, frozen food to fisheries, meat, poultry, and food grains. The Table No 3 clearly states that the percentage of agricultural exports is also rising significantly. If we compare value of Exports and Imports, country is at surplus balance of payment position.

**Table: 3 India's Imports and Exports of Agricultural Commodities (Value in Rs Crore)**

Source: Directorate General of Commercial Intelligence & Statistics, Ministry of Commerce, Kolkata.

Note: 2004-05 to 2013-14 is actual data and 2014-15 to 2019-20 is Estimated value

India's Imports and Exports of Agricultural Commodities is seen in the (Table 3). The average growth in the imports was worsened in 2009-10 and 2011-12. But later 2013-14 shows negative growth in imports. The average growth of exports was quite satisfactory and was 23.89%. Year 2011-12 was a good year where we can see highest growth in respect of exports of agricultural commodity.

**D. Flow of Institutional Credit to Agriculture Sector:** Agricultural Credit, as per Annual Report 2014-15, DAC, it was decided in June, 2014 to double the flow of agriculture credit in three years with reference to base year 2003-04. Against the credit flow of Rs. 86981 crores in 2003-04, agriculture credit target of Rs.8 lakh crore has been set for 2014-15. Against this, the achievement upto December, 2014 is

Rs. 5,45,744 crores. Table No 4 highlights on ST - Short term, MT - Medium term, LT - Long term loans provided by Co-operative Banks, RRBs, Commercial Banks, Other Agencies.

**Challenges:** The declining land-base for agricultural operations, diminishing water tables, shortage of farm-labour, increasing costs of inputs and uncertainties associated with prices/realisation which impact the viability of farming are some of the formidable challenges the agriculture sector faces. Resource use efficiency to improve factor productivity and ensuring natural resources sustainability are necessary to reconcile the conflicting demands of farmers and consumer. While the country is presently self-sufficient in cereals, it meets its domestic requirements for pulses and edible oils through imports. Despite the various efforts being made, there is no technological breakthrough in pulses, the yields are still hovering around 600-800 Kg per hectare. Pulses continue to be grown by small and marginal farmers on marginal lands under rained conditions. Even though substantial increases have been made in the MSP, due to weak procurement/price support mechanism, farmers' response in terms of increase in acreage under pulses is lukewarm. Nearly half of our domestic requirement of edible oils is met through imports. Developing oil palm, which have high oil contents, on large track of lands suitable for its cultivation, can bridge the gap between demand and supply of edible oils.

**Opportunities:** Substantial investments in physical, growth drivers social and agricultural infrastructure as the key growth drivers which will enable the economy to achieve 'inclusive growth'. Although we expect these three factors to contribute significantly in India's growth story during the current decade (2011-20), the role of other factors (such as technological progress, improvement in productivity and India's young demography, etc.) should not be underrated. Further, Government of India (GoI) and the private sector need to undertake necessary integrated efforts to strengthen these growth drivers and achieve high GDP growth.

The agriculture sector in India is expected to generate better momentum in the next few years due to increased investments in agricultural infrastructure such as irrigation facilities, warehousing and cold storage. Factors such as reduced transaction costs and time, improved port gate management and better fiscal incentives would contribute to the sector's growth. Furthermore, the growing use of genetically modified crops will likely improve the yield for Indian farmers.

**Conclusion:** The 12th Five-Year Plan estimates the food grains storage capacity to expand to 35 MT. Also, a 4 per cent growth would help restructure the agriculture sector in India in the next few years. In India, the future obviously belongs to agriculture. Our dream is to make India a Developed Nation through agricultural growth. Agriculture is intended to become not merely an efficient, eco-friendly production system, capable of meeting basic demands of the rapidly increasing population, but it has to become a major powerful instrument for a comprehensive socio economic transformation of the country, including improvement in the quality of the life of every individual. This is an exciting opportunity and a challenging responsibility.

## **FOREIGN DIRECT INVESTMENT INFLOWS AND CAUSAL FACTOR: AN ECONOMETRIC ANALYSIS**

**Prof. Neelkanth G. Pendse<sup>1</sup> & Namrata Shrivastava<sup>2</sup>**

<sup>1</sup>*Professor, Department of Post Graduate Studies and Research in Economics, Rani Durgavati University, Jabalpur (M.P.)*

<sup>2</sup>*Research Scholar, Post Graduate Studies and Research in Economics, Rani Durgavati University, Jabalpur (M.P.)*

**Section I: Introduction:** Foreign direct investment can be termed as package of resources that complements the financial flows and makes a distinctive contribution to the development process. Foreign direct investment projects typically involve a transfer of technology and managerial skills from the source country to the recipient country and also provide greater access to world market for the recipient country's exports. Foreign Direct Investment is fund flow between the countries in the form of inflow or outflow by which one can able to gain some benefit from their investment whereas another can exploit the opportunity to enhance the productivity and find out better position through investment with the purpose of long term then it is contributes positively towards economy. Depending on the industry sector and type of business, a foreign direct investment may be an attractive and doable option. The studies try to find out the implications which affect the economic scenario and also measure the level of predominance by the factors for economic contribution to India.

It has long been argued that Foreign Direct Investment (FDI) plays an important role in promoting export and economic growth of an economy. It is argued that FDI promotes exports of the host countries by increasing the productivity and productive capacity of the host country by increasing capital stock, transfer of technology, managerial skills and upgrading the skills of the local workforce through training. Further, FDI also increases the opportunity for the host countries to export by facilitating access to the new and large foreign markets. However, the role of FDI in promoting export is a controversial topic and basically depends upon the motive for such investment. If the motive for FDI is to bypass the trade barriers of the host countries, to gain access to large overseas market and to reap the benefits of economies of scale, this may not promote export. Such kind of market seeking investment is called horizontal FDI. However, if the motive for FDI is to reap the benefits of host country's comparative advantage so as to produce at relatively low cost, such investments are likely to promote trade and hence complement trade. Such FDI is called export oriented or vertical FDI.

Realizing the important contribution of foreign investment to economic development, India has introduced many policy reforms to attract them. Restrictive investment regimes have been liberalized. In addition, various types of incentives are being offered to attract foreign direct investment. Greater attention is also being paid to create macroeconomic environment for foreign conducive investors. In recent theoretical and empirical work, investment has been identified as a key variable determining economic growth. Thus, if FDI crowds out domestic investment or fails to contribute to capital formation, there would be good reasons to question its benefits for recipient developing countries. Moreover, given the scarcity of domestic entrepreneurship and the need to nurture existing entrepreneurial talent, a finding that MNEs displace domestic firms would also cast doubts on the favourable development effects of FDI. In fact, FDI is a much larger proportion of investment in developing than in developed countries.

The present paper has been divided into five sections. Section- I is devoted to Introduction. Review of literature has been done in Section-II. Section-III belongs to research methodology. The main

determinants of FDI in Indian economy for the period 1980-81 to 2014-15 are presented in section IV. Section V is devoted for summary and conclusion of the problem at hand.

**Section II: Literature Review:** Review of literature gives relative information about concerning the problem and provides an improved understanding to make objectives of the research study. Though several empirical studies have been conducted concerning the factors determining FDI. Most of the studies utilize multiple numbers of theories. While many of studies have been conducted regarding to test the FDI causal factors and found the size of the market almost universally as an important determinant of FDI in developing countries. **Chow (1987)** argued that his empirical evidence supports the hypothesis that export growth causes industrial development. The relationship between exports and economic growth based on the correlational and regression analysis. Results show that there is a positive relationship between exports and growth; therefore, they suggest that exports are an important driver of economic growth across countries. **Bahmani-Oskooee, M., Mohtadi, H., & Shabsigh, G. (1991)** examined the comovement and causal impact of foreign direct investment (FDI) and exports on economic growth in 21 Asian countries over the period 1980 to 2013. Findings strongly confirm that there is a long-run steady-state relationship between FDI, exports, and GDP for the selected countries. There is long-run bidirectional causality between FDI and GDP and between exports and GDP. This can be concluded that FDI and exports do have causal impact on long-run growth in the countries being investigated. **Shamsuddin (1994)** examined the economic determinants of private FDI by using a single equation econometric model for 36 less developed countries for the year 1983. The FDI for the year 1983 was modeled as a function of one year lagged values of GDP, growth rate of GDP, per capita debt, availability of energy resources in the recipient country, wage rate, capital debt volatility of prices (computed from the CPI data). Empirical findings observed that the most important factor in attracting FDI is the per capita GDP in the host country, followed by other proxies used. Empirical results are supportive of all hypotheses proposed for testing with the exception of the effect of energy availability. **Ahmad and Harnhirun (1995)** examine the causal impact of exports on growth in ASEAN countries, including Indonesia, Malaysia, the Philippines, Singapore, and Thailand, using data for the period 1966 to 1990. Test results found exports are confirmed to have causal impact on growth only in Singapore. This indicates that exports do not seem to have causal impact on growth in other ASEAN countries under investigation. **Mucchielli and Soubaya (2000)** investigated the determinants of the volume of trade of the French Multinational Corporations (MNCs). The major findings suggest that inward FDI has a positive influence on Foreign trade (including exports and imports), and this positive influence is stronger for exports compared with imports. **Nair-Reichert and Wienhold (2001)** and another researchers, mainly focuses on the causality running from FDI to GDP. The two-way link between FDI and GDP stems from the fact that increased FDI promotes growth in host countries, whereas brighter growth prospects in the host countries attract an increased flow of FDI. **Asiedu (2002)** applying Least Square techniques for all estimations in the study and found that openness, return on investment and GDP as proxy variable for market size, are significant variables for FDI fostering and infrastructure and political risk found insignificant. **Quazi and Mahmud (2004)** investigated that which factors, either economic or non-economic, drive the flow of FDI into South Asia and found that economic freedom, openness, prosperity, human capital, and lagged FDI significantly increase FDI inflow into South Asia, while political instability depresses it. **Janicki et al. (2004)** examined bilateral foreign direct investments (FDI) between the members of the European Union and eight central and east European candidate economies in transition for the year 1997. Openness to trade, market size, labour cost and the institutional investor country risks are used as proxies of Foreign Direct Investment (FDI) inflows. Empirical results reveal that all the variables taken as determinants of FDI are found significant impact on the FDI inflows. **Naeem, Ijaz, and Azam (2005)** used time series data from 1970-71 to 1999-2000 for Pakistan and found the main

economic factors are market size, domestic investment, trade openness, indirect taxes, inflation, and external debt. **Tsen (2005)** investigated the location-related determinants of FDI in the manufacturing industry of Malaysia using time series data from 1980 to 2002. Inflation, infrastructure, education (human capital), exchange rate, market size, current account balance were the variables used for the determinants of FDI. The findings concluded that an increase in education, infrastructure, market size or current account balance lead to an increase in FDI flows. **Hansen and Rand (2006)** investigate the causal relationship between FDI and economic growth in a sample of 31 developing countries, using the Granger causal analysis. They find bi-directional causality between FDI and economic growth. FDI really plays a very significant role in the selected countries. Although the above-mentioned researchers support the growth impact of FDI, this impact is likely to be differential and conditional on various factors. **Burak Camurdan and Ismail Cevis (2009)** developed an empirical framework to estimate the economic determinants of FDI inflows by employing a panel data set of 17 developing countries and transition economies for the period of 1989-2006. Seven independent variables were taken for this research namely, the previous period FDI, GDP growth rate, wage, trade rate, inflation rate and economic investment. The empirical results conclude that the previous period FDI is important as an economic determinant. Besides, it is also understood that the main determinants of FDI inflows are Inflation rate, the interest rate and trade (openness) rate. **Jayachandran, G. and Seilan, A., (2010)** investigated the relationship between Trade, Foreign Direct Investment (FDI) and economic growth for India over the period 1970-2007. Economic growth may induce FDI inflow, Trade and FDI may also stimulate economic growth. There is a causal relationship between the examined variables. Economic growth, trade and FDI appear to be mutually reinforcing under the open-door policy. **Tekin (2012)** examines the causal impact of exports on economic growth in 18 least-developed countries, using data for the period 1970 to 2009. They find unidirectional causality running from exports to GDP in only three countries and from GDP to exports in three countries. Based on the empirical findings of this study, exports do not help promote economic growth in the least-developed countries being investigated. The above findings indicate the impact of FDI on economic growth to be debatable. From this perspective, it can be concluded that the role of FDI in growth enhancing seems to be country-based, depending on the economic, institutional, human capital, and technological conditions in a recipient economy. **Kachoo et al. (2012)** identified the factors determining FDI inflows to 32 developing countries. The FDI inflows are modeled as a function of the market size, total reserves, infrastructure, labour cost and degree of openness for the host countries. Empirical estimates suggested that all the variables except openness have strong bearing on the inflows of overseas capital. **Sharmiladevi and Saifilali (2013)** examined the macroeconomic variables that act as potential determinants of FDI inflows. The authors used time series data for the period 2000-01 to 2011-12, and the study employed ordinary Least Square (OLS) method. Results indicated that among the selected variables, export, index of industrial production, inflation shows statistically significant at 5 % level. The researcher concluded that parameters which the internal business environment of a nation like growth rate, inflation, IIP, exports are having a direct influence upon India's credibility in the international arena in terms of attracting more FDI. **Parashar (2015)** investigated the determining factors of foreign direct investment (FDI) inflow in both China and India from 1980 to 2013 using econometric modeling. Linear regression analysis of time series data was done for 34 years. Macroeconomic indicators such as market size, infrastructure, and opportunity cost for investors, trade openness, growth rate, policy changes and inflation were assumed to be the determinants. The analysis revealed that, for both countries, market size was an important factor. Also, in the case of China, lower wage rates played an important role in attracting FDI, while in India; it is policy reforms that played a crucial role in attracting FDI.

**Section III: Research Methodology:** The study is based on secondary sources of the statistics. This becomes more essential when the numbers of variables are large; it requires adequate degree of freedom

to carry out the traditional statistical tests of significance. Thus, to cater this need of the research a period of 35 years was thoughtfully selected. The data for the purpose of analysis will constitute time series incorporating a period of 1980-81 to 2014-15. A problem is studied best where it exists. The present study aims at analysing the Long run relationship between Foreign Direct Investment Inflows in India. Since the study is based on secondary statistics Union of India was purposively selected. Thus Union of India constitutes as study units. The data used in the study are annual data for the period 1981 to 2015 sourced from the various publication of RBI Handbook, Ministry of commerce and Industry Govt. of India, DIPP and Shodhganga, Stasticstimes.com, Ministry of Finance Govt. of India. In addition to this data can also be explored from some other sources of publication.

**Objectives of the Study:** The overall objective of the study is to investigate into the causal factors responsible for Foreign Direct Investment inflows in the Indian economy. However, the specific objectives of the present study are as under:

1. To identify the determinants of FDI inflows in the economy during the period.
2. To see the impact of the variables on the inflows of FDI during the period.

**Hypothesis of the study:**

- I. Structure and pattern of variables is remained same.
- II. Causal relationship between foreign direct investment inflows and its determinants is absent.

**Model Specification**

**Overall Period Model:**  $FDI_t = \beta_0 + \beta_1 (MSIZE)_t + \beta_2 (EXTDEBT)_t + \beta_3 (REER)_t + \beta_4 (FOREX)_t + \beta_5 (PCI)_t + \beta_6 (IIP)_t + \beta_7 (TRADEOPEN)_t + \beta_8 (INFLATION)_t + \beta_9 (IND TAX)_t + \beta_{10} (INFRAINDEX)_t + \beta_{11} (GOV EXP)_t + \beta_{12} (EX \%GDP)_t + \varepsilon_t$

**Overall Period Model:**  $\log (FDI)_t = \beta_0 + \beta_1 \log (MSIZE)_t + \beta_2 \log (EXTDEBT)_t + \beta_3 \log (REER)_t + \beta_4 \log (FOREX)_t + \beta_5 \log (PCI)_t + \beta_6 \log (IIP)_t + \beta_7 \log (TRADEOPEN)_t + \beta_8 \log (INFLATION)_t + \beta_9 \log (IND TAX)_t + \beta_{10} \log (INFRAINDEX)_t + \beta_{11} \log (GOV EXP)_t + \beta_{12} \log (EX \%GDP)_t + \varepsilon_t$

**Variable Specification**

FDI	Foreign Direct Investment Inflows
MSIZE	Market size proxy used Gross Domestic Product
EXT DEBT	External Debt
INFRAINDEX	Infrastructure Index
PCI	Per capita income
TRADE OPEN	Trade Openness (X+ M/GDP*100)
INFLATION	Inflation % CPI
IND TAX	Total Indirect Taxes
FOREX	Foreign exchange reserve
GOV EXP	Government expenditure
REER	Real Effective Exchange Rate
IIP	Index of industrial production
EXE GDP	Export as a % of GDP

**Multiple Regression Analysis:**

To examine impact of caused factor multiple regression analysis is used. The general linear regression model is just an extension of simple regression model. However the derivation of the required results from these (normal) equations involves algebraic complexities. With the use of matrix algebra, the derivation of the results becomes much easier.

Generalising the two and three variable linear regression models, the k- variable regression model involving the dependent variable Y and k-1 explanatory variables X<sub>1</sub>, X<sub>2</sub>, ..., X<sub>k</sub> may be written as

$$Y_i = \beta_0 + \beta_1 X_{1t} + \beta_2 X_{2t} + \dots + \beta_k X_{kt} + u_i$$

$$\beta = (X'X)^{-1}X'Y$$

Here is the vector of required least squared estimators  $\beta_0, \beta_1, \beta_2, \dots, \beta_k$

$$S.E. \beta_i = \sqrt{(var \beta t)} = \sigma_u^2 (X'X)^{-1}$$

**Section IV: Determinants of FDI in Indian economy:** The regression results of Overall period have been presented in table 1 to 2. The results of the present study are in partial conformity with earlier study. TRADEOPEN, EXTDEBT and EX % GDP were found statistically significant at 1% level. INDIRECTTAX, PCI and REER were found statistically significant at 5% level. FOREX and GOVEXP were found statistically significant at 10% level. Rest of the parameters was found statistically insignificant. The entire twelve explanatory variables taken together explain 97.3 % variation in dependent variable. The log linear version has shows the coefficient of REER was found statistically significant at 1 % level. EX % GDP were found statistically significant at 5% level. TRADEOPEN, INDIRECTTAX, EXTDEBT, and INFLATION were found statistically significant at 10% level. Rest of the parameters was found statistically insignificant. The results of the analysis show that generally FDI in India is related positively with MSIZE, TRADEOPEN, FOREX and EXP as % of GDP these variables. Theoretically, the relationship between FDI Inflows and MSIZE, Trade Openness, FOREX, and Export as percentage of GDP should be positive. In the present analysis relationship between FDI Inflows and Trade Openness, FOREX, INFRAINDEX, GOVEXP, REER and INFLATION found to be positive but the coefficients of PCI, EXP as % GDP, and EXTDEBT were turned to be negative, this happens when a high degree of multicollierity exists among the explanatory variables. Similarly, relationship between FDI Inflows and REER, EXTDEBT and INFLATION should be negative. Again the coefficient of EXTDEBT is suffering from the problem existence of high degree of multicollierity among the explanatory variables.

**Table 1: Regression estimates of Linear model (Overall Period)**

\* Significant at 1% level of significance \*\* Significant at 5% level of significance \*\*\* Significant at 10% level of significance

### Section V: Summary and Conclusion

The purpose of this study was to examine the determinants of inward FDI in India region and sector wisely, by regression analysis. In the model there were twelve explanatory variables. They are, respectively, MSIZE, FOREX, INFRAINDEX, GOVEXP, TRADEOPEN, EXTDEBT, INDTAX, PCI, IIP, REER, EXP as % of GDP and INFLATION. The results of the present study are in partial conformity with earlier study. TRADEOPEN, EXTDEBT and EX % GDP were found statistically significant at 1% level. INDIRECTTAX, PCI and REER were found statistically significant at 5% level. FOREX and GOVEXP were found statistically significant at 10% level. Rest of the parameters was found statistically insignificant. The entire twelve explanatory variables taken together explain 97.3 % variation in dependent variable. The log linear version has shows the coefficient of REER was found statistically significant at 1 % level. EX % GDP were found statistically significant at 5% level. TRADEOPEN, INDIRECTTAX, EXTDEBT, and INFLATION were found statistically significant at 10% level. The results of the analysis show that generally FDI in India is related positively with MSIZE, TRADEOPEN, FOREX and EXP as % of GDP these variables. Theoretically, the relationship between FDI Inflows and MSIZE, Trade Openness, FOREX, and Export as percentage of GDP should be positive. In the present analysis relationship between FDI Inflows and Trade Openness, FOREX, INFRAINDEX, GOVEXP, REER and INFLATION found to be positive but the coefficients of PCI, EXP as % GDP, and EXTDEBT were turned to be negative, this happens when a high degree of multicollierity exists among the explanatory variables. Similarly, relationship between FDI Inflows and REER, EXTDEBT and INFLATION should be negative. Again the coefficient of EXTDEBT is suffering from the problem existence of high degree of multicollierity among the explanatory variables.

## **PROSPECTS AND CHALLENGES IN E-COMMERCE IN RECENT ERA**

**Ravaliya Dipika Maheshbhai**

*Research scholar, Veer Narmad South Gujarat University, Surat, Gujarat*

### **Introduction:**

The E-commerce is one of the leading things that have taken the Indian industry by Storm. It is force to change whole economy, which has a huge prospective and is basically varying the way industries are done. E-commerce means anything that involves an online transaction. It's beneficial to both parties' buyers and sellers. Availability of large scale of goods and services is making buying online more attractive and convenient for consumers over the globe. Ever since 1991, after economic reforms explicitly took place in India as a consequence of opening of the economy with a view to integrate itself with the whole economy of the world. The must to assist international trade both through policy and procedure reforms has become the foundation stone of India's traffic and fiscal policies. As a result last decade have witnesses a technological revolution attended by the expansion of the internet, web technologies and their applications. E-commerce as element of the information technology revolution spread widely in India as well as globe. Utilize of internet in business has driven electronic commerce to become one of the main competent channel for inter organization commerce procedure.

**MEANING OF E-COMMERCE:** The full abbreviation of E-Commerce is electronic commerce. Business transaction done through electronically on the internet is known as E-Commerce. E-Commerce means buying and selling of goods and service or else the transmitting of funds or data using electronic network be fond of internet. Initially it's found in 1960s, when business started using electronic data interchange to split business documents with other companies. In era of 1979, the American National Standards institute developed ASC X12 as a universal standard for businesses to share documents through electronic networks. In E-Commerce business transaction take place with business to business, business to consumers, consumers to business and consumer to consumers. The expressions E-Commerce and E-Business are frequently used interchangeably. E-Commerce performed using various applications such as email, online catalog, file transfer protocol and web service. Its provided benefits covered wide range of availability of goods and services, availability of 24 hours, the speed of Access and international reach etc. the e-commerce market continues growing.

### **OBJECTIVE OF THE STUDY**

- a. To understand the concept of E-commerce.
- b. To shown the recent issues and challenges faced by the E-commerce business.

### **REVIEW OF LITERATURE**

**Chanana & Geole (2012)** Researcher studied the future of Ecommerce in India. Some crucial aspect which will extensively contribute to the boom of the E-Commerce industry in India such as replacement guarantee, M-Commerce services, place based services, numerous payment option, right content, delivery alternative, legal obligation of generating invoices for online transactions, immediate Service, clear & realistic term and conditions, the product feature should be same as shown on the portal and availability of 24/7 customer care centre should be there.

**Raghunath & panga (2013)** it was based on problem and prospect in ecommerce. Latest technology consisting positives and negatives associated with it's apply and Adoption. Consequently, it arising need of crating new ethical issues related to business will emerge. New ethical issues must be identified and immediate steps and actions should be taken. To expansion of E-commerce and adoption by customers needs avail the sources of consumer confusion, apprehension and risk need to be identified, understood

and alleviated. E-commerce endows with fabulous occasion in different areas but it entails wary application for consumer security issues. its enlargement depend to a great extent on efficient IT security systems for which necessary hi-tech and legal provisions need to be put in place and toughen persistently.

**Malhotra (2014)** Author deliberated on E-business issues and challenges in Indian prospective. It was concluded that Indian customers return much of the commodities they purchase online, Cash on delivery is the preferred payment mode, Payment gateways have a high failure rate, Internet penetration is low and Feature phones still rule the roost.

**Harjor and darjor kour (April 2015)** present paper discussed about benefits of ecommerce to customers, retailers, producers and distributors. Its various segments that would grow in the future like: Travel and Tourism, electronic appliances, hardware product and apparel. E-commerce offers benefits like cost effectiveness, quick comparison shopping, better customer service, information saving and knowledge market development.

**Abdul gaffer khan (2016)** studied carried on benefits and challenging emerging in ecommerce. The e-commerce revolution has primarily changed the business of transaction by providing new opportunities and breaking borders quality. In Bangladesh, it has muscularly impacted the conventional commerce system and varying the life of inhabitants by making it easier. It avail benefits to customer and seller, e-commerce gives challenges to traditional business for competitive position. Developing nation's appearance many barriers that affect the victorious execution of e-commerce with the help of contrast with developed country.

**RESEARCH METHODOLOGY:** The methodology of present paper is theoretical. Methodology consist only secondary data like as publication research, journals and online sources This has been applied in present study the conceptual framework, definition, present trends and some of the challenges and opportunities of e-commerce in India.

#### **RECENT OPPORTUNITIES**

##### **I. Uses of Smartphone and availability of apps**

Online shopping is more instances and conceivable that consumers will easily able to open the app, search for a goods and services, select products or services according their conveniences and arrive at their door at time they select all in transaction.

**II. Expansion of social media:** Recent era social media consider as part of commerce and their voice are getting louder. Expansion uses of Google, Bing and different shopping sites have shaped the direct return advertising arena for ecommerce retailer over the last decade.

**III. Opportunities for Producers, whole sellers, retailers and customers:** Producer able to take benefits of ecommerce through providing better information about their product or services to the other links in the business chain and creates brand identity. Wholesaler can establish contractors with reputed producers and concerning trade with the online. Ecommerce avail much additional information regarding variety things to the consumers, meet electronic orders and be in touch with the consumers all the time. Peoples are getting linked with ecommerce by providing internet facility or cyber café. Persons can who establish cyber and have their benefits.

**IV. Assistance for Patrons:** The avail major assistance from the buyers point of view is momentous increase and saves of time and eases access from anywhere in the globe at any time. The core remuneration of ecommerce for customers such as reduced transaction costs for participating exchange in a market, availability of transaction in 24\*7 hours, remove time and place barriers, quick and continuous access to information, convenience, switch to other company if there are not pleased with a company, wide range of accessibility of may not be available at local or national market and buyers can seen review comments about a product and can see what others are buying or see the review comments of other customers before making a final buy.

**V. Assistance for manufacturers:** E-commerce awarded reimburse to sellers like as increasing revenue and reducing operation, maintenance costs, purchase and procurement costs, transportation costs, increase customer loyalty and retention, develops customer and supplier relationships, improves speed of the process of selling, improves internal, external communication and develops the company image and brand.

#### RECENT CHALLENGES

**I. Finding the appropriate merchandise to sell:** Shopping cart platforms like Shapely have eliminated several barriers of entry. Any person will launch a web store among days and deign commerce all varieties of product. Amazon, flipkart, jabong, myntra and others are absorbing the e Commerce world with their large on-line product catalog. Their marketplace and fulfillment services have enabled sellers from everywhere the globe easily reach paying customers.

**II. Ethical issues:** Under the Ecommerce business Ethical issues is one of the major issues in both customers and producer sites. The Internet offers extraordinary ease of access to a vast collection of goods and services. The rapidly expanding arena of "click and mortar" and the largely tolerant cyberspace intermediate have however prompted concerns about both confidentiality and data security.

**III. Customer Acquisition Forces:** Successful e-commerce interaction between markets should be strong. Issues related to lack of supply chain integration, high charges for products, delay in delivery and lack of proper courier services in some areas also make customers frustrated and one of challenge faced by e-commerce. To get people to come on e-commerce site and make purchase involves heavy cost due to advertisement and marketing which is biggest problem that early stage of ecommerce startup will face.

**IV. Product Target:** The concept of target marketing is becoming progressively more important tool of differentiation. Product which is not suitable for the customers tend to got replaced or returned. Some goods take long delivery time to reach customers home. Delivery time of products may range from days to month .This is key issue which leads into generally loss in revenue, loss of shipment costs and reputation. The average Indian customer poses great trust issues for e-commerce transactions.

**V. Less Awareness:** Indian customers are more comfortable in buying products comfortable and choose the product by touching the product directly. Most of the Indian rural populations are not aware of internet and online buying system. When it comes to ratio of internet patrons, scenario is not so admirable one. Very little are alert of the online corruption and fraud and thus darkness still exists.

**VI. Attracting the true customer:** Online shoppers don't shop an equivalent manner as they won't to back within the day. They invite recommendations on Social Media. They use their smart phones to browse product reviews whereas in-store and get hold of purchases using all different form of payment options. Lots have modified covering the means they consume content and communicate on-line. They get simply distracted with technology and social media. Retailers should discover wherever their audience is and the way to influence in them with efficiency while not killing their marketing budget.

**VII. Generating targeted traffic:** Digital distributor channels area unit evolving. Retailers will not more believe one kind of channel to drive traffic to their on-line store. They must effectively leverage SEO, PPC, email, social, show ads, retargeting, mobile, searching engines and affiliates to assist drive qualified traffic to their on-line store. they have to be visible wherever their audience is being attentive.

**VIII. Capturing quality leads:** Online retailers are unit defrayal a major quantity of cash driving traffic to their on-line store. With conversion rates move between 1% to 3, they need to place plenty of effort in generating leads so as to induce the foremost out of their marketing efforts. The money is within the list. Not solely can assist you communicate your message; however it'll additionally permit you to prospect more exploitation tools like Face book Custom Audiences. Not all leads are created equally. Retailers should craft the correct message for the correct audience so as to convert them into leads with hopes of turning them into customers.

**IX. Nurturing the best prospects:** Due to an oversized email list is valueless if manufacturer not actively participating with subscribers. A modest proportion of email list may truly convert into paying customers. Though, trader should always deliver price with their email marketing efforts. On-line retailers put plenty of targets communicating product providing furthermore as promotions, but prospects want more than that. value and entertainment goes an extended way but that needs extra work.

**X. Converting shoppers into paying customers:** Driving quality traffic and nurturing leads is essential if you would like to shut the sale. At a main point, you need to convert those leads so as to pay money for your marketing campaigns. Retailers should perpetually optimize their efforts in converting both email leads additionally as web site guests into customers. Conversion optimisation is a continuous method.

**XI. Retaining customers:** Attracting new customers is costlier than retaining the present ones you have already got. Retailers should implement ways to assist them get the foremost out of their customer base in increase customer period of time worth.

**XII. Achieving profitable semi permanent growth:** Increasing sales is a method to grow the business however within the finish, what matters most is gain. on-line retailers should always realize ways that to chop inventory prices, improve promoting potency, scale back overhead, scale back shipping prices and management order returns.

**XIII. Choosing the correct technology & partners:** Some on-line retailers might face growth challenges as a result of their technology is limiting them or they've employed the incorrect partners/agencies to assist them manage their incomes. Retailers needing to succeed growth should be engineered on an honest technology foundation. They need to select the correct shopping cart solution, inventory management software system, email software system, CRM systems, and analytics so far more. Additionally, hiring the incorrect partners or agencies to assist you implement projects or oversee marketing campaigns can also limit your growth. On-line retailers should select rigorously United Nations agency to figure with.

**CONCLUSION:** Present paper discuss about various issues and opportunities in E-commerce business. E-commerce assists beneficiates to the retailers, wholesalers, manufacturers and customers. Recently E-commerce is the extensive use of computer network using internet. Various segments utilize e-business such as Travel and Tourism, electronic appliances, hardware product, apparel and others etc. E-commerce afforded benefits such as cost effectiveness, quick comparison shopping, better customer service, information saving and knowledge market development. The e-commerce industry is one of the leading industries in the upcoming years. It has basically changed the business of transaction by generous new opportunities and creates new challenges. It makes traditional businesses into modern competitive world. When the availability of easy internet at low cost will be low then the e-commerce will flourish easily and will make many of traditional business to run out of their business. Many challenge to be faced by the e-commerce industry. Recent world of new technology businesses need to continue grow with new types of consumer needs and trends because it will prove to be vital to their business' success and survival. E-commerce is constantly progressive so business needs to more advance and business will prosper in an e-commerce setting with much accomplishment and productivity.

## **IMPACT OF INTERNAL MARKETING PRACTICES IN NEPALESE COMMERCIAL BANKS**

**Bishal Pant**

**1. Introduction:** The satisfaction and retention of quality employees is an essential component of organizational effort and has been linked to organizational success. The issue of quality employees has received much attention in organizations due to high costs associated with them especially in services sectors. According to Panigyrakis & Theodoridis (2009), internal marketing is a planned effort using a marketing-like approach to overcome organizational resistance. Internal marketing focuses on the importance of the marketing concept internally, by focusing on the employees and providing a source of competitive. Internal marketing is different from human resource as it develops human potential in order to fulfill the organizational and individual goals. The related studies in this ground revealed that internal marketing activities improve organization's competitiveness through motivation in employees and enhance competencies (Ahmed *et al.*, 2003). Internal marketing has been practiced in many big organizations particularly, under different names although it's a new and emerging discipline. Motivating the employees and encouraging them to offer superior services to customers which will improve the customer satisfaction of the company's services are the importance of internal marketing (Lings & Greenley, 2005). The promises made by organizations to their external customers, would not be realized unless employees are motivated and willing to keep such promises (Gronroos, 2009). Different studies have found evidence supporting the view that the essential components of successful service industry operation is the implementation of internal marketing in an organization (Choi *et al.*, 2013). In today's volatile environment and intense competition, firms are faced with competitive pressures and rapidly changing markets, they need to find a way to be more flexible, adaptive and competitive (Opoku *et al.*, 2014). Bank as a service sector can compete more successfully in the external marketplace only when there is an attitudinal change among staff towards service-mindedness and customer focus (Papasolomou & Kitchen, 2004). This has led service organization to adopt internal marketing and treat their employees as internal customers (Mishra, 2010). Kameswari & Rajyalakshmi (2012) stated that the satisfied employees are the biggest asset to an organization whereas dissatisfied employees are the biggest liability. The aspects of job satisfaction like pay, colleagues, supervisors, working conditions, job security and promotion are positively inter-correlated to job satisfaction (Sang *et al.*, 2009). To achieve job satisfaction and maintain a good relationship between the supervisor and the employees, communication plays the key role (Carriere & Bourque, 2009). Internal marketing activities through the influence and motivate employees leads to increase their job satisfaction and organizational commitment, organizational competitiveness improves and their competencies enhance (Ahmad and Rafiq, 2002). Mehta (2014) investigated impact of human resource practices on job satisfaction of employees in foreign and local banks of Pakistan. The result showed that HRM practices such as compensation planning, performance appraisal and working development have positive impact on employee satisfaction. Similarly, Ali *et al.* (2014) assessed the impact of three HRM practices such as compensation, promotion and performance evaluation practices on employee job satisfaction and organizational commitment. The result showed significant and positive relationship between three HRM practices and job satisfaction. Ghazzawi (2008) found a significant relation of work climate and training and development with employee satisfaction. Allen (2010) showed that employee training has a significant relationship with employee satisfaction. The study showed that enhancing employee training positively improves the employee satisfaction. Ivancevich *et al.* (2011) defined employee's job satisfaction as degree to which employees like the job or individual

aspects such as nature of work or supervision. Other believed it is multidimensional psychological responses to one's job. Dawis & Lofquist (2012) pointed out that job satisfaction is a pleasurable affective condition resulting from one's appraisal of the way in which the experienced job situation meets one's needs, value and expectations. Commitment is the bond employees experience with their organization. The psychological and emotional attachment of an employee to his or her organization, accepting the goals and values of the organization, and delivering high-quality service in order to satisfy and retain the customer is employee commitment (He *et al.*, 2010). Narteh (2012) described employee commitment as a felt state of employee's attachment to their organizations, including their willingness to internalize the values of the organization and abiding by the rules and regulations therein. Ahmad & Al-Borie (2012) investigated the impact of internal marketing on job satisfaction and organizational commitment. The study showed that selection and appointment, training and development, organization support, incentives and motivation, and retention policy have a positive and significant relationship with employee job satisfaction and organizational commitment. Mahmud (2013) analyzed the relationship between internal marketing and employee performance in the telecommunication industry in Malaysia. The result indicated that internal marketing orientation is positively correlated to employee performance. Bitner (1990) concluded that the physical setting may also influence the customer's ultimate satisfaction with the service. The study found that unless employees are happy and satisfied with their working environment, they cannot be fully committed to their job. Korunkaa and Kubiceka (2009) carried out a study on the impact of human resources practices like compensation practice, performance evaluation practice and promotion practice on employee's job satisfaction, perceived performance and commitment. The study found that the human resource practices have positive impact on the employee job satisfaction. Shah (2010) examined the relationship between rewards and employee's performance in cement industry in the context of Pakistan. The empirical results concluded that there is a direct relationship between extrinsic rewards, intrinsic rewards and the employee performance. According to Ashar *et al.* (2013), there is significant positive association of training and development with employee satisfaction and commitment. Katua *et al.* (2014) assessed the effect of reward and compensation strategies on the performance of commercial banks in Kenya. The study found that financial and non financial rewards can combine to enhance firm performance. The study concluded that there is a positive relationship of strategic reward and compensation with employee performance. The study also revealed that commercial banks should embrace the use of both financial and non financial rewards in addition to other incentives and performance. The study on the effect of internal marketing perception on job satisfaction and employee commitment found that implementation of internal marketing plans in human resources management has a positive impact on attraction, retention and job satisfaction of employees as internal customers of Mell Bank (Zargarani *et al.*, 2013). Hasaballah *et al.* (2014) carried out a study on internal marketing and employee empowerment. The study found that there exist a positive significant relationship between internal marketing and employee empowerment. In the context of Nepal, Maharjan (2016) reported a positive relation between work motivation and job satisfaction of teachers. The result also showed that work motivation and job satisfaction are highly positively correlated. Pandey (2015) examined the impact of employee participation on job satisfaction, employee fairness perception and organizational commitment in Nepalese commercial banks. The result indicated that employee participation is positively related to employee job satisfaction, employee fairness perception and organizational commitment. The study found that there is positive and significant impact of training and development, performance appraisal, employee participation in decision making on the employee organization commitment and employee job satisfaction (Shrestha, 2016). The above discussion reveals that that there is no consistency in the findings of various studies concerning impact of internal marketing on employee job satisfaction. The major purpose of this study is to identify the relationship between internal marketing and employee

job satisfaction in Nepalese commercial banks. Specifically, it examines the impact of salary, training, promotion and working environment on employee job satisfaction in Nepalese commercial banks. The remainder of this study is organized as follows: Section two describes the sample, data and methodology. Section three presents the empirical results and the final section draws conclusion and discuss the implications of the study findings.

**2. Methodological aspects:** The study is based on the primary data which were gathered from 112 respondents of 15 commercial banks in Nepal. The respondents' views were collected on salary, training, promotion, working environment and job satisfaction level in Nepalese commercial banks. Table 1 shows the number of commercial banks selected for the study along with the number of the respondents.

**Table 1: Number of commercial banks selected for the study along with number of respondents**

S.N	Name of the commercial banks	Numbers of respondents
1	NIC Asia Bank Limited	6
2	Laxmi Bank Limited	7
3	Prabhu Bank Limited	8
4	Standard Chartered Bank Nepal Limited	8
5	Nepal SBI Bank Limited	7
6	Himalayan Bank Limited	9
7	Machhapuchchhre Bank Limited	5
8	NMB Bank Limited	5
9	Sanima Bank Limited	7
10	Global IME Bank Limited	8
11	Sunrise Bank Limited	9
12	Nabil Bank Limited	8
13	Nepal Investment Bank Limited	7
14	Everest Bank Limited	9
15	Siddhartha Bank Limited	9
<b>Total number of respondents</b>		<b>112</b>

Thus, the study is based on 112 observations.

**The model:** The model estimated in this study assumes that the employee satisfaction depends on several internal marketing practices. Moreover, the various factors affecting the employee satisfaction are salary, training, promotion and working environment. Therefore, the model takes the following form:

**Model**

$$ES = \beta_0 + \beta_1 S + \beta_2 T + \beta_3 P + \beta_4 W + e_i$$

**Where,**

ES = Employee job satisfaction is the degree to which employees like the job or individual aspects.

S = Salary is the amount that employee receives from organization for service and effort they put.

T = Training is an organized method of learning and development which expand the efficiency of employees.

P = Promotion is defined as advancement of an *employee* within a company position or *job* tasks.

W = Working environment is the conditions in which an employee can perform his/her duties comfortably.

**Salary:** Salary is the amount that employee receives from organization for service and effort they put. There exists negative relationship salary and employees' turnover intention which play significant role in increasing the productivity of the organization (Ali & Amin, 2016). Similarly, Gieter & Hofmans (2015) analyzed the effect of salary on employees' intention to quit and found negative relationship between them. Based on it, the study develops the following hypothesis:

*H<sub>1</sub>: There is a positive relationship of salary of the employee with employee satisfaction.*

**Training:** Training is an educational process that enhances the performance of employees which involves the sharpening of skills, concepts, changing the attitude and gaining more knowledge. Training is an organized method of learning and development which expand the efficiency of individual, group, and the organization (Goldstein& Ford, 2011). Ivancevich et al. (2011) stated that training and development have positive significant impact on employee job satisfaction and commitment. Sarita (2012) found that there is positive significant relationship between training and development and employee job satisfaction and commitment. Based on it, this study develops the following hypothesis:

*H<sub>2</sub>: There exists a positive relationship between training with employee satisfaction.*

**Promotion:** Promotion is defined as advancement of an *employee* within a company position or *job* tasks. Schuler and Jackson (2005) analyzed relationship between promotion and employee performance. The study found positive relationship between promotion and employee performance According to Tessema and Soeters (2006), there is a positive relationship among the promotion practices and employee perceived performance. Brown (2003) found that the lack of meaningful work and opportunities for promotion significantly affects employees' intention to leave the organization. Shields and Ward (2001) identified that the employees who are dissatisfied with the opportunity available for promotion show a greater intention to leave the organization. Based on it, the study develops following hypothesis:

*H<sub>3</sub>: There is a positive relationship of promotion with employee satisfaction.*

**Working environment:** Working environment is about creating conditions in which an employee can perform his/her duties comfortably. Workplace environment includes factors such as managerial support, peer encouragement, adequate resources, opportunities to apply learned skills, technical support and consequences for using training (Burke and Hutchins, 2008). According to Jain & Kaur (2004), better workplace environment leads to increase in employee satisfaction. Jayaweera (2015) stated that there is positive and significant relationship between work environment factors and job satisfaction. Based on it, the study develops the following hypothesis:

*H<sub>4</sub>: There is positive relationship of working environment with employee satisfaction.*

### 3. Results and discussion

#### Correlation analysis

On analysis of data, correlation analysis has been undertaken first and for this purpose, Pearson's correlation coefficients have been computed and the results are presented in Table 2.

**Table 2: Pearson's correlation matrix for the dependent and independent variables for selected Nepalese commercial banks**

*This table reveals the Pearson's correlation coefficients between dependent and independent variables. ES (employee job satisfaction is the degree to which employees like the job or individual aspects) is the dependent variable. the independent variables are S (salary is the amount that employee receives from organization for service and effort they put), T (training is an organized method of learning and development which expand the efficiency of employees), P (promotion is defined as advancement of an employee within a company position or job tasks) and W (working environment is the conditions in which an employee can perform his/her duties comfortably)*

Variables	Mean	S. D.	S	T	P	W	ES
S	2.991	0.921	1				
T	3.012	1.179	0.656**	1			
P	2.991	0.880	0.671**	0.309**	1		
W	3.024	0.646	0.295**	0.347**	0.402**	1	
ES	2.898	0.870	0.670**	0.357**	0.207*	0.217*	1

*Notes: The asterisk signs (\*\*) and (\*) indicate that the results are significant at 1 percent and 5 percent level respectively*

The result shows that there is positive relationship of salary of employee with their satisfaction level which indicates that higher the salary, higher would be the employee satisfaction. Likewise, the study observed positive relationship between training and employee satisfaction indicating that better the training, higher would be the employee satisfaction. Likewise, promotion is positively correlated to

employee satisfaction. It indicates that better the promotion practices, higher would be the employee satisfaction. The result also shows that working environment is positively related to employee job satisfaction in Nepalese commercial banks. It indicates that better the working environment, higher would be the employee job satisfaction.

**Regression analysis:** Having indicated the Pearson's correlation coefficients, the regression analysis has been carried out and the results are presented in Table 3. More specifically, it presents the regression results of salary, training, promotion and working environment on employee job satisfaction in Nepalese commercial banks.

**Table 3: Regression results of salary, training, promotion and working environment on employee job satisfaction in Nepalese commercial banks**

The results are based on 112 observations from 15 sample banks by using linear regression model. The model is  $ES = \beta_0 + \beta_1 P_i + \beta_2 S_i + \beta_3 T_i + \beta_4 W_i + \varepsilon_i$  ES (employee job satisfaction is the degree to which employees like the job or individual aspects) is the dependent variable. the independent variables are S (salary is the amount that employee receives from organization for service and effort they put), T (training is an organized method of learning and development which expand the efficiency of employees), P (promotion is defined as advancement of an employee within a company position or job tasks) and W (working environment is the conditions in which an employee can perform his/her duties comfortably)

Model	Intercept	S	T	P	W	Adj-R <sup>2</sup>	SEE	F- value
1	8.58 (5.220)**	0.32 (4.20)**				0.21	2.59	11.04
2	13.43 (7.03)**		0.38 (4.39)**			0.24	2.51	13.66
3	10.95 (4.85)**			0.18 (2.54)**		0.19	2.50	9.31
4	14.25 (7.86)*				0.41 (4.48)**	0.34	2.60	16.49
5	5.38 (2.45)*			0.23 (2.55)*	0.37 (4.60)**	0.35	2.44	27.44
6	6.18 (2.14)*	0.27 (3.40)**			0.43 (5.23)**	0.11	2.50	10.09
7	11.79 (7.59)**		0.30 (3.66)**		0.34 (3.70)**	0.14	2.45	13.60
8	7.37 (3.90)**	0.25 (3.06)**	0.27 (2.93)**			0.16	2.50	10.38
9	10.38 (5.04)**	0.21 (2.66)**		0.09 (1.18)	0.30 (2.54)**	0.14	2.45	13.71

Notes:

- i. Figures in parentheses are t- values.
- ii. The asterisk signs (\*\*) and (\*) indicate that the results are significant at 1 percent and 5 percent level respectively.
- iii. Dependent variable is employee satisfaction.

Table 3 shows that the beta coefficients for working environment are positive with employee satisfaction. It indicates that better the working environment, higher would be the employee job satisfaction. This finding is similar to the findings of Jayaweera (2015). Likewise, the beta coefficients for promotion are positive with employee satisfaction. It indicates that better the promotion practices, higher would be employee satisfaction. This finding is consistent with the findings of Tessema and Soeters (2006).

#### 4. Summary and conclusion

Human resources are the intangible, precious and important assets of an organization without which various operations and activities within the organization are not possible. Employees strive to work in those organizations that provide positive work environment and work together to move the organization forward. If a company adopts internal marketing practices, then it is beneficial not only for employees but also for the employers as well. Therefore, internal marketing practices are designed to benefit both employees and employer.

This study attempts at determining impact of the internal marketing aspects affecting employee satisfaction in Nepalese commercial banks. This study is primarily based on primary sources of data collected from 112 respondents.

The study shows that salary, training, promotion and working environment have positive impact on employee satisfaction in the context of Nepalese commercial banks. The study concludes that working environment is one of the important internal marketing practices which enhance the employee performance and increase the satisfaction level within the employees. Internal marketing enhances the success of the marketing practices internally towards achievement of objectives. The satisfaction and retention of quality employees is an essential component of organizational success. The study also concludes that working environment followed by training, salary and promotion are the most dominant factors that influence the employee satisfaction in the context of Nepalese commercial banks.

## **DEVELOPMENT OF MANAGEMENT THOUGHT IN THE CO-OPERATIVE MANAGEMENT WITH REFERENCE TO (F. W. TAYLOR, HENRY FAYOL)**

**Prof. Dr. Nitin W. Jaswante**

*Asst. Professor Dept. of Commerce, L.M.M. Arts, Commerce & Ashok Science College, Chandur (Rly) Dist. Amravati.*

**Introduction:-** Co-operative is a voluntary association of an individual generally, the members of co-operative society belongs to weaker section of the society. Management goes to on those shoulders that are uneducated or semi-educated, or they don't have adequate knowledge of management. Due to improper management many co-operative society are not in the existence. Survival of any organization mainly depends upon effective management technique. The application of the principles and process of management over the co-operative of the organization implies the important of the co-operative management. Besides, the principles of management, co-operative follows their own principles led down by the Maharashtra co-operative society Act, 1960. In simple words, we can say co-operative management is the combination of different two terms. Co-operative and management, co-operative is the combination of different two terms. Co-operative and management, co-operative is an organization of those people who have common needs and management is a systematic process, which increases efficiency and effectiveness of an organization by applying various principles and technique in an organization. Therefore, co-operative management may be defined as the efficient and effective utilization of the resources of the co-operative as a business organization for the purpose of surviving the need of member within the context of the accepted co-operative principles. Co-operative society are based on equality, self-help, mutual responsibility, democracy, etc. Hence, the success of co-operative management depends upon the active participation of members, cordial relationship between the members, managing committee and board of directors and society should follow appropriate values. Co-operative management tries to achieve more effective and equitable system of resource management.

**Role of management:** Management combines ideas, processes, materials, facilities and people to effectively provide needed services to member-owners. Management is the decision making element of the co-operative. Broadly speaking, its role entails formulating and executing operating policies, providing good service, maintaining financial soundness and implementing operating efficiencies to successfully meet its objects. A successful co-operative is variable in an economic or business sense and maintains or improve its co-operative character or features. A co-operative may succeed as a business but, gradually lose its co-operative character regarding member control, serving the needs of members, and distributing net margins. Likewise, it may succeed for a while as a co-operative, but fail as a sound business institution. Managing a co-operative is challenging and difficult. It involves not only managing resources and business operations, as in other business, but also dealing with problems storming from the co-operatives distinctive characteristics. Because, the co-operatives members are both owners and patrons, special relationship and problems arise concerning member and board of directors roles and responsibilities.

### **Objectives of the study**

1. To identify Management Principles of Co-operative Organization.
2. To study management principles given by F.W.Taylor and Henry Fayol and their application in the management of co-operative organization.
3. To compare principles of co-operatives with the principles of modern management thinkers and their similarities.

**Research methodology****Research type:** - Descriptive research**Data Collection:** - This study based on the secondary data. This information has been collected from different sources. These are as under✓ **Journal, Articles, Books,****Limitations:-**

1. This study based on secondary data.
2. There may be some changes.
3. This study have done in very short period of time.

**Application of Management principles given by F. W. Taylor, Henry Fayol:** Generally In co-operative sector no special management thought is developed. Then you will think what do you mean by development of management thought in co-operative management. Before that will see the term management Even before describing and defining the term management, it would be useful to stress on the need of it. The need and the concept of management are associated with the phenomenon of grouped activity. Every were in a modern society, we find groups of people working in all spheres of human activity. The term management has wider scope. Whenever human being perform any kinds of activity , we find the term management or people working together in groups such as a school, college , university , business enterprise , government administrative , co-operative organization and an army , etc. Due to management or effective management system, any sector can achieve predetermine goals and objectives. If we look towards the history of company, we find one thing that they were giving huge important to management of activities. In present scenario every company have special department of management. Now, we are going to talk about the thought of development of management. It is stress that, there are various management thought developed by management thinker like F. W. Taylor, Henry Fayol, Peter Druker and by various management schools, etc .

Discussion about the development of management thought in co-operatives is quit complex and comprehensive because, in companies there is no management thinker who developed management principle and thought specially for co-operative management. Hence, will see how principle of by F. W .Taylor and Henry Fayol will be applicable in the management of co-operatives organization. There are similarities between principle of co-operatives and principle given by F. W. Taylor and Henry Fayol.

- 1) **Principle of equity:** This principle has also given by Henry Fayol and it is also one of most essential principle of co-operatives. According to Henry Fayol there should be equality, everyone should get equal treatment as well as there should be no scope for discrimination. For the effective management the same thing is applicable in every co-operative organization. If there is equality in co-operative organization or at the same time every member is getting equal treatment, and there is no discrimination, so in such case the co-operative organization will grow . Members and employee will work hard. Besides, this it will also create loyalties among them. Therefore, as per Henry Fayol concern the term equality should consider while managing the organization.
- 2) **Principle of training and development / scientific selection method:** Another principle is training and development, in corporate sector it is denoted by scientific selection. Modern management thinker emphasis for effective management, organization should adopt principle of scientific management. It refers to selection of right candidate for right job and after selection, organization should provide training to them so they will get idea about their work, company's mission and vision and how company is? The same management principle is applicable in the management of co-operative organization. It was suggested by Macgalen, committee is always in a need of training and development apart from this Indias some legend personality( VaikunthbhaiMeheta , DhanajayraoGadgil and Dr. VitthalraoVikhePatil ) has also given more emphasized on this

principle or thought of effective management of co-operative organization . Training and development is essential because, it creates awareness among the members as well as motto behind running of co-operative organization .It is also essential because in India very few universities taught the subject of co-operative. Therefore, employees who selected or appointed by co-operatives organization do not have an idea about co-operatives .Co-operative organization work with isolated principle, objectives and goals. With the help of training and development it becomes easy to create awareness about co-operatives .And this will help in better management of an organization.

- 3) **Principle of democratic / initiative:** Modern management has given emphasized on it. Initiative refers to motivate the employees to take participation in the every activity of management. The same is applicable in the co-operative organization .The management of co-operative organization promote principle of democratic. Every members have right to take participation in the management. It create healthy environment within the organization. Democratic management principle welcomes the views of every member while taking decision. Therefore, correct decision can be taken by the organization.
- 4) **Principle of professional management:** Professional management refers to apply professionalism that is formal process for the managing of co-operatives houses. Co-operative organization should adopt or hire that employee who has knowledge of managerial skill, and even at the same time they should take expert services. According to management thinker like F. W. Taylor, Henry Fayol, Peter Druker etc manager should possess managerial skill due to market situation. Not only manager should have managerial skill but also every staff members of co-operatives should be well known about it. Fayol said there should be a clear cut idea of authority, responsibility, division of work etc. Professional management promotes this principle also.
- 5) **Principle of general interest:** Fayol states that, “the interest of one employee or group of employees should not prevail over that of the concern “. He added that, to ensure there must be firmness, fairness, and constant supervision should be there. This principal is also applicable in management of co-operatives organization.
- 6) **Co-operation among co-operatives:** Co-operatives serve their members most effectively and strengthen the co-operative movement by working through local, national, regional and internationalstructure.
- 7) **Application of principles of co-operation:** Co-operatives have to first follow the principles of co-operation laid down by ICA, and then they have to go for applying the management process. It has to keep a balance between these two. Weeramanstates that “the proper application of co-operatives principle is necessary for the success of the movement. For the co-operatives all the principle areessential, that is absolutely indispensable to the achievement of co-operative movement’s role”.

**Conclusion:-**Due to lack of management technique many co-operatives are suffering from huge amount of loss. No doubt that there is no special management techniques or principles developed but even after the application of management principles of Modern management thinkers i.e. F.W. Taylor and Henry Fayol, management of co-operatives can be done by effective manner.

## **ROLE OF E-COMMERCE IN AGRICULTURE SECTOR IN PRESENT SCENARIO**

**Prof. Sanjay G. Gawai**

*(M.Com, M.Phil, Net), L.M.M.Arts & Commerce College, Chandur Railway, Dist. Amravati, State . Maharashtra.*

**Introduction:** With so many aspects of Human Life Dramatically changing in this age of Globalization there is bound to be tension in various areas e.g. Agriculture sectors, Marketing sectors, Service and business sectors etc. E-commerce is business conducted via the Internet as a world-wide distribution channel for goods and services. Unlike previous forms of electronic commerce – via fax, telephone and telex, e-commerce represents a qualitative jump in the ability to bring buyers and sellers closer together. In the process, buyers and sellers can communicate more effectively about their requirements, product and price information is more readily available, and just-in-time delivery of customized goods is more easily achieved. There is still much optimism about the potential success of e-commerce's in agriculture. Common agribusiness business-to-business (B2B) transaction such as buying, selling, trading, delivering, and contracting seem to be natural targets for conversion to e-commerce. There is still much optimism about the potential success of e-commerce's in agriculture. Common agribusiness business-to-business (B2B) transactions such as buying, selling, trading, delivering, and contracting seem to be natural targets for conversion to E-commerce many theoretical benefits of e-commerce in agriculture have been identified such as promotion of information flow, market transparency and price discovery facilitation of industry coordination and reduction or elimination of transaction costs. These theoretical benefits appear to be undisputed. However, they have yet to materialize into profitability. The current hiatus in agribusiness e-commerce points to the difficulty of implementing (B2B) solutions. These revised forecasts show that while B2B in general will grow at a faster rate than initially anticipated. B2B growth in agriculture probably will take more time than initially anticipated. Are there external factors that make e-commerce execution in agriculture difficult perhaps even impossible? Why does there seem to be a significant gap between theory and practice? How could one expect to succeed in the future in this environment? In addition, B2B commerce encompasses settlement transactions such as invoicing, payments, etc. Here, B2B is used to encompass any information exchange between businesses related to a buy or sell transaction. Discussed the general barriers cited by businesses to Internet based e-commerce adoption. Those include Y2K budgets, unclear return on investments, lack of stakeholder support and complicated technology. These concerns appear to apply to agribusiness as well. However, there may be additional factors slowing down e-commerce adoption in agriculture. This paper attempts to evaluate agribusiness-specific factors which slow down success, and evaluates the impact of these factors on future B2B success in agriculture. It will look at three dominant factors that impact the development of B2B commerce in agriculture Change in industry structure Product complexity and High-touch nature of transactions in agriculture.

**Importance:** The first factor preventing B2B commerce in agriculture to develop fully is the current change in industry structure. In the last decade, consolidations at all levels of the value chain have changed the traditional relationship between players. Consolidation in agribusiness may impact e-commerce implementation in two ways reduction of the need to electronically coordinate fragmented marketplaces; and creation of barriers to the development of transparent electronic market places.

**1. Transparent Marketplaces:** The second impact of consolidation is on the development of virtual marketplaces. Earlier, e-commerce has been used to replicate traditional physical central markets. These "exchanges" allow prices to be discovered through new pricing and market mechanisms and promise greater market access and transparency. Several agribusiness start-ups currently offer e-commerce

solutions that take advantage of the possibilities offered by the Internet Consolidated companies are even competing with start-ups and creating their own e-commerce Internet-based e-commerce will fundamentally alter the ways in which exchanges between buyers and sellers take place. Various agribusiness sites and transaction models already offer the promise of better product information better price reduced risk better market access and access to new customers despite these possible benefits, a threat to consolidated players is posed by greater price transparency. As a result they will be reluctant to participate in these market mechanisms. A report prepared by Iowa State University discussed the issue of market control and concluded that one of the intangible benefits of the Cargill-Continental merger is: "A broader coverage of the major world suppliers and customers in the world grain and oilseed trade may offer improved market intelligence, a key to effective trading in a very risky environment, a well as more effective and timely sourcing to serve a broader array of discriminating customers Monitoring a larger share of the market place provides a consolidated player with increased price and market information. Information control and asymmetric information in the marketplace lead to higher profit markets. Therefore, profits by consolidated players are eroded by more efficient access to information in their marketplace.

**2. Product Complexity:** The second factor slowing down e-commerce adoption is the increasing complexity of products being sold in agriculture markets. This complexity arises from two sources: traditional and end user-driven.

**3. Traditional Product Complexity:** The first source of traditional product complexity has been the development of common price reference for commodity. Central marketplaces such as the Chicago Board of Trade or the Chicago Mercantile Exchange have provided these common price references. However, differences in location, time of delivery and actual shipping quality lead to complex individual transactions. Each buy/sell transaction is performed on the basis that buyers know what they are buying and that sellers have adequately represented the product they have for sale. Unlike manufactured goods, agricultural commodities are only partly uniform. Their price depends upon several factors. Standard grades help simplify product description (USA). To make matters more complex, local prices also may vary constantly. Digitizing all the information of a common commodity product like No. 2 yellow corn (location, time, price, quality, quantity, etc.) is complex and requires very elaborate databases and search engines. Dominant Factors in Agriculture E- With the current technology, the cost in time and effort to the buyer of searching for all these attributes may outweigh any advantages the buyer may gain.

**4. End User-Driven Complexity:** The second source of the complexity of products is end-user driven products. This type of Complexity has evolved over the last few decades due to focus on consumer demands for healthier, convenient, and more flavorful foods; and development of trait specific products valuable to processors along the value chain. Both product drivers create a need for product isolation along commodity channels. This is accomplished through preserving the identity of these products along parallel channels. The transformation of crop and livestock production from commodity to differentiated product industries will be driven by consumers' desire for highly differentiated food products; their demands for food safety and trace-back ability; from continued advances in technology; and from the need to minimize to total costs of production, processing, and distribution argued that to capture greater value added along the supply chain, commodities have to become branded products. However, these products require consistency and high quality. Those attributes cannot be sustained in a commodity market relying on spot purchases. In the past, agribusiness has responded to the complexity of responding to consumer preferences by vertically integrating the supply chain backwards. Poultry production is an example of this evolution and pork production has slowly been moving in that direction also. There are several reasons for a more integrated supply chain capturing profits through ownership Reducing risks Lowering costs Assuring adequate inputs or markets; and Responding faster to changing consumer

demands can the changing demands on the livestock and grain system be met as well without integration. The pork industry is quickly moving in that direction. In other words, to realize these advantages, contracting must go beyond a written document with signatures. It needs an integrated data storage, management and retrieval system. An often overlooked advantage of e-commerce is the opportunities it creates for supply chains to “virtually integrate”. Quick information flow between supply chain participants leads to reduced risk, lower costs, better decision making, market access and faster responses to changing consumer demands.

**5. Impacts of Product Complexity:** Both types of products complexity in agriculture create opportunities and threats for B2B commerce. On one hand, opportunities arise from the streamlining of transactions. The Internet allows the “digitization” of information that would otherwise be too costly or impossible to capture. On the other hand, threats arise from the individuals nature of these product transactions which creates the need for “point solutions”, or information exchange systems tailored to a specific product or process. The vision of one all-encompassing information system unrealistic in agriculture. So far, the search for this unique system has generated several business models such as: auction systems on-line catalogs and bidding systems evaluating various offerings and deciding on the “right” model is slowing down B2B e-commerce adoption among agribusinesses. For instance, we are currently observing several online cash exchange market, each claiming to have the winning business model These offerings are showing that different solutions may be appropriate for high-volume commodity trading but may not be adequate for specialized corn where thin markets (e.g. high oil corn) may prevent price discovery. Product evaluation is one of the steps toward adoption of innovation. Therefore; high complexity in the world of B2B probably will slow down the process of adoption.

**6. High-Touch Transactions:** The third factor creating barriers to B2B adoption in agribusiness is the high-touch nature of transactions. Individuals farms receive a great deal of personalized individual attention. Buying inputs, selling grain or livestock, purchasing machinery, obtaining financing, and arranging transportation are all transactions traditionally conducted on a one-to-one basis. Some argue that agriculture is fundamentally driven by relationships it is not uncommon to see agriculture land leases sealed by a handshake Farm operator evaluation by farm managers relies more on trust and recommendations than production factors. A local study also found that personal relationship have an impact on land prices Physical connectedness has traditionally been a valued component of agricultural transactions. In fact, in the last decade, the study of “social capital” has recognized that when making decisions, other factors besides purely economic goals may motivate human behavior. Professional experiences by the authors also support the idea that agricultural markets rely heavily on personal interactions. Early surveys on the use of the Internet as a sales tool have indicated that the majority of agribusiness firms perceive that personal relationships are difficult to develop over the Internet Customer and supplier resistance to Internet use are among firm’s top 10 barriers to change Managers are less likely to develop an Internet strategy if they perceive that farmers lack trust in making Internet purchases Recent studies support these perceptions by demonstrating that prior acquaintance increases trust between the parties.

Producers have yet to understand the specific role the Internet might play in their business.

**7. Strategic Implications:** As stated earlier, these barriers slow down e-commerce adoption in agriculture. Nonetheless, despite these obstacles, there is room for creative solutions potentially leading to successful adoption. Those potential strategies touch on Structure of the industry, Market and product expertise; and Organizational development.

**8. Industry Structure:** Current industry consolidation still leaves room for firms to develop winning strategies. Such strategies involve creating third party marketplaces, forming strategic alliances, becoming niche players, or evolving into virtual supply channels. Each strategy will fit a unique situation.

**9. Third Party Marketplaces:** Porter (2001) pointed out that industry structure is a key determinant of the types of e-commerce solution that will be adopted in an industry. Marketplaces with fragmented buyers and sellers will be the best fit for “third party” marketplaces. If either the buying or selling side is concentrated or consolidated, bargaining power is in the hands of the consolidated side. In this case, the dominant party in the relationship has no incentive to delegate market power to a third party marketplace.

**Strategic Alliances:** The survival of e-commerce start-ups may depend upon their ability to forget strategic alliances with industry participants of all sizes. large, consolidated companies are attractive as business partners because of the volume they command. However, their indecisiveness and the uncertainty they face may slow down e-commerce adoption among agribusiness. Alliances between smaller players may allow them to form electronic synergies and perhaps compete more effectively with large players. Industry consolidation does not necessarily lead to oligopoly and these are smaller players who are ready to adopt new solutions and take the risk to be innovators. By aligning with these partners and developing e-commerce solutions that fit their needs, start-ups may be able to push true innovation.

**Conclusion:** Given the above challenges facing B2B in agribusiness, it becomes readily apparent that not only the value, but also the mere existence and profitability of third-party, “pure-play” ventures are Dominant Factors in Agriculture E-Commerce 11 marginal at best. This conclusion is based on the premise that consolidation alters the competitive dynamic at both ends of the value chains (farm inputs and food retailers). As a result, we are faced with a new and evolving paradigm in the agro-food sector. Therefore, the true value of the Internet, and hence the market capitalization of pure play ventures is ultimately going to be determined by their ability to introduce efficiencies into antiquated and inefficient business practices and systems. Competition in most marketplaces is shifting away from direct competition between competing firms and toward competition between supply networks. Such a shift can be illustrated by examining the competitive dynamics characteristic of modern grain production. Not much competition exists between neighboring farmers (competing agribusinesses) as compared to the intense competition between the recently formed seed-chemical conglomerates (supply networks). Therefore, the theoretical “killer application” involves combining supply chain management, electronic data interchanges (EDI), and physical exchanges it is questionable whether third party “pure plays” are capable of providing much value to the Cargill’s and ConAgra’s of the world because there is little “surplus value” for one to extract. However, value does exist in providing non-vertically aligned producers and processors with information systems, thereby allowing trade and coordination among them as though they were vertically integrated (Virtual Integration). In the not too distant future, venture capital funds and producers alike will realize that the true Internet play is one based on coordination and not the pure exchange play. Regardless of the specific strategy or market sector that a given third party “pure play” intends to operate, it becomes imperative to be physically involved with a significant amount of the selected commodity. Having gained physical control of a commodity, work that can begin on developing an electronic transaction system where the competitive advantage is based on making the supply network more efficient vis-à-vis “old-economy” (Non-Internet based) supply networks. Further more, physically possessing a commodity, via contract production or similar means should partly negate concerns of being reduced to an application provider. In other word, a pure play operating in grain trading would be at less risk of obsolescence if it were trading, heading, or developing delivery and logistics system for grain it physically possessed. This recommendation is of particular relevance when considering pure electronic cash exchange ventures that need to attain critical mass for liquidity purposes. The theory driving the development of internet –based exchanges is the reduction of market fragmentation. In other words, market fragmentation would be reduced and efficiencies gained if a single commodity-specific exchange should exist. However, the multiplication of internet based exchanges has resulted in actually increasing the same type of market fragmentation that such exchanges were originally designed to eliminate. The future success of B2B e-commerce in agribusiness is undeniable. Factors specific to agriculture will create additional challenges which must be overcome before success may be attained. The ability of each player to work through this challenges will determine the speed of adoption of B2B in agriculture

**EFFECT OF PORTFOLIO DIVERSIFICATION ON THE FINANCIAL PERFORMANCE OF NEPALESE COMMERCIAL BANKS****Silu Sayami, Sima Poudel, Som Raj Nepali, Srijana Poudel & Sudan Kumar Oli**

**1. Introduction:** Banks are the financial intermediaries that channelize the funds in the economy. They bridge the gap between surplus saving units and the deficit saving units. Better performance of the banks is ensured if they make lucrative, qualitative and diversified portfolio while using its loanable funds. It is wiser and safer to put eggs in different basket than putting them in one basket. The creation of the portfolio of investments and the loans is focused on enhancing the financial performance and mitigating the risk of the banks (Margrabe, 2007). Credit risk management is very important to banks as it is an integral part of the credit creation process. Diversification is a portfolio strategy designed to cut back risk by combining various investments. Diversification gains from shifting into non-interest income in bank's revenue and reduces volatility of bank profits (Stiroh, 2004). The global financial crisis of 2008, also known as subprime crisis, was partly due to too many exposures to real estate industry. The credit portfolio concentration fatal hit the whole banking industry of United States heavily which later caused contagion effect in most of the countries. Hence, in light of this global financial crisis, the diversification of investment has become one of the important issues to discuss about bank's stability and profitability. Generally, diversification is captured in four dimensions: loans, deposits, assets, and geography. Classical finance theory suggests that diversification should be a way to reduce the risk within a portfolio of assets given asymmetric information in banking market. Theory also highlights that concentration increases the cost of financial intermediation and reduces the incentive to monitor. The bank should be as diversified as possible because the diversification of banks' credit portfolio is positively associated with bank profitability (Diamond, 1984). Diversification improves cost efficiency through lower risk from it, if it occurs, and lowers the required risk premiums on un-insured debt and other contingent claims, such as derivative contracts (Moon, 1996). Similarly, Olweny and Shiphoo (2013) found that income diversification significantly affects banks' profits. Landi and Venturelli (2012) revealed that diversification absolutely affected efficiency in terms of profits, prices and revenue growth. However, Raei *et al.* (2016) found that there is no statistically significant relationship between use of portfolio diversification strategy in bank's ROA and ROE. Financial institutions may also have higher average revenues if the institutions use some of the gains from diversification to make higher risk investments (Hughes and Mester, 1998). Drucker and Puri (2009) also showed that diversified banks can gain economies of scope through spreading fixed costs over multiple products. However, Berger *et al.* (2010) found that diversification is associated with reduced profit and higher costs. Acharya *et al.* (2006) argued that there are diseconomies of scope that arise through weakened monitoring incentives and a poorer-quality loan portfolio when a risky bank expands into additional industries and sectors, complementing the agency-theoretic analysis of the boundaries of a bank's activities. Tabak *et al.* (2011) found that loan portfolio concentration increases return and also reduces default risk. However, this positive influence of sectoral focus on return decreases with bank's risk, contradicting the U-shaped relationship found by Acharya *et al.* (2006), between focus and return. The study also argued that high risk banks may even have their returns decreased due to concentration, but their risk may also reduce due to this strategy, which becomes a clear risk-return trade-off for these banks. On the other hand, financial institutions should focus on a single line of business so as to take greatest advantage of management's expertise and reduce agency problems, leaving investors to diversify on their own (Jensen, 1986 and Denis *et al.*, 1997). Berger *et al.* (2010) found a negative impact of diversification on bank performance in all activity areas viz. geography, loans, deposits and assets. Similarly, the study revealed a declining profit premiums and

augmented cost factors for more diversified banks. Rossi *et al.* (2009) revealed a positive relationship between diversification and firm profits, however, a negative relationship between diversification and banking costs and risks. The study also argued that increase in diversification lowers the economic capital requirements for banks. Berger *et al.* (1999) found that consolidation in the financial services industry has been consistent with greater diversification of risks on average but with little or no cost efficiency improvements. Makokha *et al.* (2016) found a positive relationship between portfolio diversification and financial performance of commercial banks in Kenya. The portfolio diversification explained 68 percent of the changes in the financial performance. The study also revealed that most banks diversify their investments which have enabled them to increase profits and performance in the past years. Similarly, Fang *et al.* (2011) revealed that asset diversification is associated positively and loan diversification negatively with bank performance. Estes (2014) concluded that greater diversification in the loan portfolio among the various types of loan products leads to greater risk-adjusted performance. Kwan and Laderman (1999) showed that broadening banking firm revenue base improves their earnings stability and provide them with a better trade-off between risk and return. Banks in India are more profitable with higher Tobin's Q when their incomes were derived from multiple sources (Ghosh, 2011). On the other hand, Afza *et al.* (2004) found that the non-diversified firms performed better than the diversified firms. However, the high return of non-diversified firms is accompanied by low risk and the low return of diversified firms is more risky. Bettis and Mahajan (1985) found that, on an average, the related diversified firms perform better than the unrelated diversified firms. Iqbal *et al.* (2012) revealed that there is negative relationship between diversification of firms listed in Karachi stock exchange and their performance. All firms were performing equally whether they are highly diversified firms, moderately diversified firms or less diversified firms with respect to their return and risk dimensions. The study found that there is no much difference in performance with respect to classes. In the context of Nepal, Neupane (2013) revealed that capital adequacy has a positive effect on bank profitability. According to Khatri *et al.* (2015), there is positive impact of capital adequacy ratio on return on assets. There are no much more evidences of the studies conducted in the relationship between portfolio diversification and financial performance of the Nepalese commercial banks. The objective of this study is to examine the effect of portfolio diversification on the financial performance of Nepalese commercial banks. The study is organized as follows. Section 2 describes the methodological aspects, the sample and the model used in the analysis and the results. The section 3 is about data analysis and major findings of the study. The last section concludes the work and discusses the implication of the findings.

## 2. Methodological aspects

The study is based on descriptive and causal-comparative research designs incorporating the secondary data collected from the annual reports of respective commercial banks and Bank Supervision Report published by Nepal Rastra Bank. The data have been collected for the selected 19 commercial banks from the fiscal year 2009/10 to 2015/16. This makes the total sample of 19 Nepalese commercial banks and total of 133 observations.

Table 1 shows the list of sample commercial banks selected for the study along with study period and number of observations respectively.

**Table 1: List of the commercial banks selected for the study along with study period and number of observations**

S.N.	Name of the banks	Study period	Observations
1	Nabil Bank Limited	2009/10-2015/16	7
2	Nepal Investment Bank Limited	2009/10-2015/16	7
3	Standard Chartered Bank Limited	2009/10-2015/16	7
4	Himalayan Bank Limited	2009/10-2015/16	7
5	Nepal SBI Bank Limited	2009/10-2015/16	7

6	Agriculture Development Bank Limited	2009/10-2015/16	7
7	Everest Bank Limited	2009/10-2015/16	7
8	Bank of Kathmandu Limited	2009/10-2015/16	7
9	Laxmi Bank Limited	2009/10-2015/16	7
10	Machhapuchchhre Bank Limited	2009/10-2015/16	7
11	Kumari Bank Limited	2009/10-2015/16	7
12	Siddhartha Bank Limited	2009/10-2015/16	7
13	NMB Bank Limited	2009/10-2015/16	7
14	Citizen Bank International limited	2009/10-2015/16	7
15	Prime Commercial Bank Limited	2009/10-2015/16	7
16	Nepal Bangladesh Bank Limited	2009/10-2015/16	7
17	Sunrise Bank Limited	2009/10-2015/16	7
18	Sanima Bank Limited	2009/10-2015/16	7
19	Global IME Bank Limited	2009/10-2015/16	7
	Total number of observations		133

(Source: [www.nrb.org.np](http://www.nrb.org.np))

Thus, the study is based on 133 observations.

### The model

The model estimated in this study assumes that the bank performance depends on portfolio of investment and loans, advances and bills purchase. To analyze the relationship between assets portfolio diversification and performance of Nepalese commercial banks, the model takes the following forms:

Bank performance =  $f$  (real estate, government securities, corporate shares, foreign banks investment, overdraft, term loan, foreign ownership and capital adequacy ratio).

More specifically, the given model has been segmented into following models:

#### Model 1

$$ROA = \beta_0 + \beta_1(\ln RSI) + \beta_2(\ln GSI) + \beta_3(\ln CSI) + \beta_4(\ln FI) + \beta_5(\ln ODR) + \beta_6(\ln TRL) + \beta_7(FO) + \beta_8(CAR) + \varepsilon$$

#### Model 2

$$NIM = \beta_0 + \beta_1(\ln RSI) + \beta_2(\ln GSI) + \beta_3(\ln CSI) + \beta_4(\ln FI) + \beta_5(\ln ODR) + \beta_6(\ln TRL) + \beta_7(FO) + \beta_8(CAR) + \varepsilon$$

Where,

ROA = Return on asset, defined as the ratio of net profit to total assets, in percentage.

NIM = Net interest margin, defined as the ratio of net interest income to total earning assets, in percentage.

RSI = Real estate investment, defined as the sum of investment in real sector which has at least ten million of denomination, in million rupees.

GSI = Government securities investment, defined as the sum of investment in government of Nepal treasury bills, government of Nepal saving bonds and government of Nepal other securities in millions rupees.

CSI = Corporate shares investment, defined as the investment in shares of organized institutions, in millions rupees.

FI = Foreign bank investment, defined as the investment in foreign banks, in millions rupees

ODR = Overdraft loan, defined as the sum of overdraft, trust receipt loan and working capital, in million rupees.

TRL = Term loan, defined as the long term loans having installment or non-installment facilities, in million rupees.

FO = Foreign ownership, a dummy variable value one if the bank is owned by foreign banks and zero otherwise.

CAR = Capital adequacy ratio, defined as the ratio of total capital fund to total risk weighted assets, in percentage, and

$\varepsilon$  = error terms.

### Portfolio diversification variables

**Real estate Investment:** Real estate investment is the sum of investment in real sector which has at least ten million of denomination. Rosen *et al.* (1989) found the low correlation between returns and real-estate loan. The study also revealed that non-real-estate assets is outweighed by the bigger variability of real estate returns. Macit (2011) showed that the commercial banks that have a high proportion of real estate loans in their portfolios or loans to other financial institutions that specialize in real estate face a high exposure to real estate risk and lower financial performance. Based on it, the study develops the following hypothesis:

*H1: There is negative relationship between real estate investment and bank performance.*

**Government securities investment:** Government securities investment is the sum of investments in treasury bills, saving bonds and other securities of government of Nepal. Government securities carry the least risk relative to other assets because they are backed by the strength, full faith and credibility of the borrowing state. Investment on government securities were found to have the greatest significance in generating net operating profits in banks (Gikonyo, 2011). Based on it, the study develops the following hypothesis:

*H2: There is positive relationship between Investment on Government security (A3) and bank performance.*

**Corporate share investment:** Corporate share investment includes the investment in the shares of organized and listed institutions. Chike and Inyama (2014) argued that firm's monetary performance and businesses is unit successively influenced by capital market and investment in corporate shares investment. Kimani and Mutuku (2013) found that investment in shares afterward earns investment financial gain to the investors. The study also revealed that the liquid nature of those markets makes it attainable for the investors to exchange possession of securities, and reap capital gains there on. This helps in better financial performance of the banks. Based on it, the study develops the following hypothesis:

*H3: There is positive relationship between corporate share investment and bank performance.*

**Foreign bank investment:** Banks do invest in the foreign banks as well to enhance their performance. Claessens *et al.* (2001) found that foreign banks tend to have higher profits than domestic banks in the developing countries, while in developed countries foreign banks are less profitable than domestic banks. The study also showed that higher foreign bank presence and investment are related to lower profitability, costs and margins of domestic banks. Based on it, the study develops the following hypothesis:

*H4: There is negative relationship between foreign bank investment and bank performance.*

**Overdraft loan:** Overdraft loan is the credit facility, which banks offer to their prime customers, to use the fund in excess of the current available balance in customer's account. It is the short term credit facility offer of the banks. It is the sum of overdraft, trust receipt and working capital loans in the study. Banks charge relatively high interest rate on unsecured loan to cover for the increase risk. The relationship between interest rate in overdraft loan and bank performance is significant and negative (Mwambia and Nduruhi, 2016). Based on it, the study develops the following hypothesis:

*H5: There is negative relationship between overdraft loan and bank performance.*

**Term loan:** Term loan refers to the loan for the long term purpose either in installment or non-installment basis. It has a specified repayment schedule and fixed or floating interest rates. Maturity period and the denomination of the loan are higher than any other loan that occupy significant portion in the loan portfolio of the banks. There is no sufficient evidence to claim that the term loan portfolio on performance does differ but it has a positive relationship to the bank performance (Chari *et al.*, 2008). Based on it, the study develops the following hypothesis:

*H6: there is a positive relationship between term loan and bank performance.*

**Foreign ownership:** Foreign ownership refers to the complete or majority ownership/control of a business or resource in a country by individuals who are not the citizens of that country, or by companies whose headquarters are not in that country. In emerging markets, foreign banks often introduce superior lending technologies and marketing know-how, developed for domestic use, at low marginal cost which helps in enhancing market value of the banks (Grubel, 1977). Foreign companies play crucial role in the firm performance, particularly in developing and transitional economies (Gorg and Greenway, 2004). Foreign banks are more profitable than domestic one in developing countries and less profitable in industrial countries (Chaanti, 1985). Based on it, the study develops the following hypothesis:

*H7: There is positive relationship between the foreign ownership and bank performance.*

**Capital Adequacy Ratio:** Capital adequacy ratio is the ratio of total capital fund to total risk weighted assets of the banks. It is termed as one of the regulatory tool of the central bank of the country to regulate and supervise the banks. Gizaw *et al.* (2015) found that CAR has a negative effect on ROE, but not on ROA. However, Aruwa and Musa (2014), Kurawa and Garba (2014) found positive relationship between capital adequacy variable and financial performance of banks. Based on it, the study develops the following hypothesis:

*H8: There is positive relationship between capital adequacy ratio and bank performance.*

### 3. Results and discussion

#### Descriptive statistics

Table 2 presents the descriptive statistics of selected dependent and independent variables during the period 2009/10 to 2015/16.

**Table 2: Descriptive statistics**

*This table shows the descriptive statistics of dependent and independent variables of selected Nepalese commercial banks for the study period of 2009/10 to 2015/16. The dependent variables are ROA (return on asset defined as the ratio of net profit to total assets, in percentage) and NIM (net interest margin defined as the ratio of net interest income to total earning assets, in percentage). The independent variables are RSI (real estate investment, defined as the sum of investment in real sector which has at least ten million of denomination, in million rupees), GSI (government securities investment defined as the sum of investments in treasury bills, saving bonds and other securities of government of Nepal, in million rupees), CSI (corporate shares investment defined as the investment in shares of organized institutions, in million rupees), FI (foreign bank investment defined as the investment in foreign banks, in million rupees), ODR (overdraft loan defined as the sum of overdraft, trust receipt loan and working capital, in million rupees), and TRL (term loan, defined as the long term loans having installment or non-installment facilities, in million rupees). The control variables are FO (foreign ownership defined as complete or majority ownership of foreign companies, in a dummy variable value one if the bank is owned by foreign banks and zero otherwise) and CAR (capital adequacy ratio defined as the ratio of total capital fund to total risk weighted assets, in percentage).*

Variables	Minimum	Maximum	Mean	SD	Skewness	Kurtosis
ROA	0.05	4.01	1.70	0.76	0.50	0.71
NIM	0.36	10.29	4.15	1.42	1.73	5.57
MRSI	0.74	9407.34	2672.87	1766.60	1.38	2.96
MGSI	370.66	17247.14	4754.11	3247.85	1.15	1.22
MCSI	0.1	1130.86	118.84	161.13	3.26	14.09
MFI	0.02	22210.17	2860.15	4431.63	2.18	4.79
MODR	6.4	50832.82	14582.91	10489.57	1.04	0.77
MTRL	502.05	27364.80	4971.62	4414.35	2.52	8.08

<b>FO</b>	0	1	0.32	0.47	0.80	-1.38
<b>CAR</b>	5.88	28.41	12.25	2.56	2.65	13.11

Table 2 shows the descriptive statistics of variables for the Nepalese commercial banks. The minimum return on assets (ROA) is 0.05 percent and the maximum is 4.01 percent with an average of 1.70 percent and standard deviation is 0.76. Similarly, minimum net interest margin (NIM) is 0.36 percent and maximum is 10.29 percent leading to an average of 4.15 percent and standard deviation is 1.42. Investment on Real Estate Sector (RSI) ranges from minimum Rs. 0.74 million to maximum Rs. 9407.34 million with an average of Rs. 2672.87 million and the standard deviation is Rs. 1766.60. Corporate sector investment (CSI) ranges from minimum Rs. 0.10 million to maximum Rs. 1130.86 million leading to an average of Rs. 113.80 million. Similarly, the minimum investment in foreign sector (FI) is Rs. 0.02 million and maximum is Rs. 22210.17 million leading to an average of Rs. 2860.152 million. The overdraft loan (ODR) ranges from minimum Rs. 6.4 million to maximum Rs. 50832.82 million with an average of Rs. 14582.91 million. The term loan (TRL) ranges from Rs. 502.05 million to Rs. 27364.8 million with an average of Rs. 4971.618 million. Similarly, capital adequacy ratio (CAR) ranges from 5.88% to 28.41% with an average of 12.2529% and standard deviation is 2.5568.

**Correlation analysis:** Having indicated the descriptive statistics, Pearson's correlation coefficients are computed and the results are presented in Table 3. More specifically, it shows the correlation coefficients of dependent and independent variables for Nepalese commercial banks.

**Table 3: Pearson's correlation coefficients matrix for selected Nepalese commercial banks**

*This table presents the bivariate Pearson's correlation coefficients between dependent and independent variables. The dependent variables are ROA (return on asset defined as the ratio of net profit to total assets, in percentage) and NIM (net interest margin defined as the ratio of net interest income to total earning assets, in percentage). The independent variables are RSI (real estate investment, defined as the sum of investment in real sector which has at least ten million of denomination, in million rupees), GSI (government securities investment defined as the sum of investments in treasury bills, saving bonds and other securities of government of Nepal, in million rupees), CSI (corporate shares investment defined as the investment in shares of organized institutions, in million rupees), FI (foreign bank investment defined as the investment in foreign banks, in million rupees), ODR (overdraft loan defined as the sum of overdraft, trust receipt loan and working capital, in million rupees), and TRL (term loan, defined as the long term loans having installment or non-installment facilities, in million rupees). The control variables are FO (foreign ownership defined as complete or majority ownership of foreign companies, in a dummy variable value one if the bank is owned by foreign banks and zero otherwise) and CAR (capital adequacy ratio defined as the ratio of total capital fund to total risk weighted assets, in percentage).*

Variables	ROA	NIM	lnRSI	lnGSI	lnCSI	lnFI	lnODR	lnTRL	FO	CAR
<b>ROA</b>	1									
<b>NIM</b>	0.49**	1								
<b>lnRSI</b>	-0.18*	-0.31**	1							
<b>lnGSI</b>	0.34**	0.16	0.09	1						
<b>lnCSI</b>	0.25**	0.05	0.07	0.63**	1					
<b>lnFI</b>	0.12	-0.30**	0.32**	0.32**	0.34**	1				
<b>lnODR</b>	-0.07	0.11	0.34**	0.47**	0.28**	0.22*	1			
<b>lnTRL</b>	0.24**	0.14	0.17	0.61**	0.51**	0.09	0.61**	1		
<b>FO</b>	0.41**	0.05	-0.04	0.37**	0.17*	0.48**	-0.04	0.01	1	
<b>CAR</b>	0.14	0.25**	-0.32**	-0.02	-0.26**	-0.18*	0.01	0.01	-0.08	1

Notes: The asterisk signs (\*\*) and (\*) indicate that the results are significant at 1 percent and 5 percent level respectively.

Table 4 shows that the investment in government securities, corporate shares, and term loan are positively correlated to return on assets and net interest margin. It indicates that higher the GSI, CSI, and TRL higher would be the ROA and NIM. However, real estate investment has negative and significant relationship with ROA and NIM. It shows that the increase in RSI leads to decrease in the ROA and NIM. Likewise, foreign investment has negative relationship with NIM. It indicates that higher the foreign investment, lower would be the NIM. However, foreign investment has positive relationship with the ROA. Term loan is positively correlated to ROA which indicates that increase in term loan leads to increase in ROA. Both foreign ownership and the capital adequacy ratio have positive relationship with the ROA and NIM. More the foreign ownership in banks higher would be the ROA and NIM. Similarly, higher the CAR higher would be the ROA and NIM.

**Regression analysis:** Having indicated the Pearson's correlation coefficients, the regression analysis has been performed and the results are presented in Table 4. More specifically, the table shows the regression results of real estate sector investment, government securities investment, corporate shares investment, foreign investment, overdraft loan, term loan, foreign ownership and capital adequacy ratio on ROA of the Nepalese commercial bank's performance.

**Table 4: Estimated regression results of real estate sector investment, government sector investment, corporate sector investment, foreign bank investment, overdraft loan, and term loan on return on asset of Nepalese commercial banks**

The results are based on panel data of 19 commercial banks with 133 observations for the period of 2009/10-2015/16 by using the linear regression model and the model is  $ROA = \beta_0 + \beta_1(\ln RSI) + \beta_2(\ln GSI) + \beta_3(\ln FI) + \beta_5(\ln ODR) + \beta_6(\ln TRL) + \beta_7(FO) + \beta_8(CAR) + \varepsilon$  where the dependent variable is ROA (return on asset defined as the ratio of net profit to total assets, in percentage). The independent variables are RSI (real estate investment, defined as the sum of investment in real sector which has at least ten million of denomination, in million rupees), GSI (government securities investment defined as the sum of investments in treasury bills, saving bonds and other securities of government of Nepal, in million rupees), CSI (corporate shares investment defined as the investment in shares of organized institutions, in million rupees), FI (foreign bank investment defined as the investment in foreign banks, in million rupees), ODR (overdraft loan defined as the sum of overdraft, trust receipt loan and working capital, in million rupees), and TRL (term loan, defined as the long term loans having installment or non-installment facilities, in million rupees). The control variables are FO (foreign ownership defined as complete or majority ownership of foreign companies, in a dummy variable value one if the bank is owned by foreign banks and zero otherwise) and CAR (capital adequacy ratio defined as the ratio of total capital fund to total risk weighted assets, in percentage).

Notes:

- iv. Figures in parentheses are t- values.
- v. The asterisk signs (\*\*) and (\*) indicate that the results are significant at 1 percent and 5 percent level respectively.
- vi. Dependent variable is return on assets.

Table 4 reveals that the beta coefficients are negative for real estate sector investment and overdraft loan for return on assets. It shows that real estate investment and overdraft loan have negative impact on the return on assets. This finding is similar to the findings of Macit (2011). The beta coefficients for government securities and term loan are positive for ROA. It means that investment on government securities has positive impact on the ROA. Similarly, term loan has positive effect on the ROA.

Table 5 represents the regression results of real estate sector investment, government securities investment, corporate shares investment, foreign investment, overdraft loan, term loan, foreign ownership and capital adequacy ratio on NIM of the Nepalese commercial bank's performance.

**Table 5: Table 4: Estimated regression results of real estate sector investment, government sector investment, corporate sector investment, foreign bank investment, overdraft loan, and term loan on net interest margin of Nepalese commercial banks**

The results are based on panel data of 19 commercial banks with 133 observations for the period of 2009/10-2015/16 by using the linear regression model and the model is  $NIM = \beta_0 + \beta_1(\ln RSI) + \beta_2(\ln(GSI)) + \beta_3(\ln FI) + \beta_5(\ln ODR) + \beta_6(\ln TRL) + \beta_7(FO) + \beta_8(CAR) + \varepsilon$  where the dependent variable is NIM (net interest margin defined as the ratio of net interest income to total earning assets, in percentage). The independent variables are RSI (real estate investment, defined as the sum of investment in real sector which has at least ten million of denomination, in million rupees), GSI (government securities investment defined as the sum of investments in treasury bills, saving bonds and other securities of government of Nepal, in million rupees), CSI (corporate shares investment defined as the investment in shares of organized institutions, in million rupees), FI (foreign bank investment defined as the investment in foreign banks, in million rupees), ODR (overdraft loan defined as the sum of overdraft, trust receipt loan and working capital, in million rupees), and TRL (term loan, defined as the long term loans having installment or non-installment facilities, in million rupees). The control variables are FO (foreign ownership defined

as complete or majority ownership of foreign companies, in  $n$  a dummy variable value one if the bank is owned by foreign banks and zero otherwise) and  $CAR$  (capital adequacy ratio defined as the ratio of total capital fund to total risk weighted assets, in percentage).

	(1.41)	(-2.50)*			(-3.98)*	(2.25)*	(0.71)	(2.74)**	(1.53)	0.23	1.25	7.53

Notes:

- i. Figures in parentheses are *t*- values.
- ii. The asterisk signs (\*\*) and (\*) indicate that the results are significant at 1 percent and 5 percent level respectively.
- iii. Dependent variable is net interest margin.

Table 5 reveals that beta coefficients of real estate and foreign bank investments are negative for net interest margin. It indicates that real estate investment has negative impact on the NIM. Similarly, the results also reveal that foreign bank investment has negative effect on the NIM. This finding is similar to the findings of Claessens *et al.* (2001). However, the beta coefficients for government securities investment and overdraft loan are significant and positive for NIM. It indicates that government securities investment has positive impact on the NIM. Likewise, overdraft loan has positive impact on the NIM. This finding is consistent with the findings of (Gikonyo, 2011). The results also indicate that the banks having the foreign stake have higher NIM.

**4. Summary and conclusion:** Portfolio diversification refers to the way of using funds to the different pool of assets so that banks can increase the performance and reduce the credit portfolio risk. Banks offer varieties of investment and credit schemes to address the different needs of the different customers. This helps in creating portfolio diversification in terms of loans, deposits, assets, and geography. Every bank must have a well-defined, qualitative and lucrative portfolio diversification strategy to ensure the sound financial performance. This study examines the effect of portfolio diversification on the financial performance of Nepalese commercial banks. The study is based on the panel data collected for the 19 Nepalese commercial banks with total of 133 observations for the study period of 2009/10 -2015/16.

The study shows that real estate investment, corporate shares investment, government securities investment and overdraft loan are the major variables that influence the financial performance of Nepalese commercial banks. Real estate investment has negative and significant impact on return on assets and net interest margin. Similarly, overdraft loan has negative impact on return on assets which indicates that lower the overdraft loan, higher would be the return on assets. The study further reveals that overdraft loan has positive impact on net interest margin. However, foreign bank investment has positive impact on net interest margin. Similarly, term loan has positive impact on return on assets but its impact is not clear on net interest margin. The study also concludes that the most influencing factor for determining the financial performance of Nepalese commercial banks are real estate investment followed by overdraft loan and term loan.

## **FACTORS AFFECTING THE PERFORMANCE OF EMPLOYEES AT WORK PLACE IN NEPALESE COMMERCIAL BANKS**

**Rabina Khadka**

**Introduction:** Employee performance has always been a major challenge in organizational management and adopting effective ways to motivate employees to achieve and deliver higher job performance as well as increase the organizational competitiveness is the main objective of every business organization (Carrol, 1979). According to Health (2006), environment involves the physical location as well as the immediate surroundings, behavioral procedures, policies, rules, culture, resources, working relationships, work location, all of which influence the ways employees perform their work. The quality of the workplace environment impacts on employee's performance and subsequently influences the organization competitiveness. An effective workplace environment management entails making work environment attractive, comfortable, satisfactory and motivating to employees so as to give employees a sense of pride and purpose in what they do. Pheng(2006) revealed that working hours, physical condition of project site, complexity of project, material and supplies, project size, duration of project and time availability were viewed differently in terms of importance by the groups, further the study revealed that project managers with experiential differences generally related the importance of working environment in the same way, except for level of authority. This study identified the importance of the working environment variables for the performance of a project manager. Pasiouras (2007) indicated that profitability of both domestic and foreign banks is affected not only by banks specific characteristics but also by financial market structure and macroeconomics conditions. All the variables, with the exception of concentration in the case of domestic banks profits are significant. Although their impact and relation with profits is not always the same for domestic and foreign banks. Sahinisis(2008) revealed that the support to the hypotheses propose, indicating that there is a significant correlation between the employees performance effectiveness and their commitment, job satisfaction and motivation. The study revealed that unobserved branch and manager characteristics shows a positive relationship between branch performance and employee's satisfaction with the quality of performance evaluation, feedback, and recognition at the branch (Guest, 1997). Aluko (2003) found a significantly positive relationship between organizational culture and employee's performance. The study also found that the selected firms were not performing very well because of some peculiar problems. Khan (2014) examined the relationship between rewards and employee's performance. The empirical result concluded that there is a direct relationship between extrinsic rewards, intrinsic rewards and the employees' performance. Overall, result revealed that, in order to develop such a reward system which has more emphasis on extrinsic reward. Similarly, high income out) could be more motivated through intrinsic reward. Guest(2001) examined four areas of HRM practice good and safe working conditions, training and development, equal employment opportunities (EEO), and recruitment and selection. The study showed that employee performance have positive relationship between these four areas of HRM practice good and safe working conditions, training and development, equal employment opportunities (EEO), and recruitment and selection. Diefendorff et al. (2002) examined on the role of job involvement and work centrality in predicting organizational citizenship behaviors and job performance. The study revealed that job involvement, when assessed with a recently published measure is a positively significant predictor of supervisor ratings of organizational citizenship behaviors and in-role performance, controlling for work centrality and other individual difference variables. The empirical result showed strong evidence that gender moderates some of the job involvement and organizational citizenship behaviors relationships, with females having a stronger, positive relationship between these constructs than males. Reichheld (1996) examined on the link between

management practices and organizational outcome. The study revealed that there is positive relationship between management practices and organizational practices. Meyer and Allen (1997) showed the positive relationship between organizational practices, organizational commitment and desirable outcomes such as performance, organizational citizenship behavior, turnover, adaptability and job satisfaction. Lok (2006) analyzed the effects of organizational culture and leadership styles on job satisfaction and organizational commitment for employee performance. The study found statistically significant differences between innovative and supportive organizational cultures, job satisfaction and organizational commitment. The study revealed that employee performance is highly affected by organizational culture, organizational commitment and structure of job. Guven et al. (2015) examined the impact of earning, work environment, and promotion opportunities on employee performance. The study showed that earning, work environment and promotion opportunities positively influence employee performance. Ali (2013) investigated the relationship between working condition and employee's productivity. The study found that there is a positive relationship between working condition and employee's productivity. In the context of Nepal, Maharjan (2012) examined the association between work motivation and job satisfaction of teacher using convenient sampling technique with 112 respondents. The empirical result revealed positive association between work motivation and job satisfaction of teachers. The result also indicated that the administration must increase the scale of motivation according to the market price of other commodities to motivate the teachers. Overall, the result revealed that teachers are motivated with their work and also they are satisfied with their job. Shrestha and Mishra (2015) revealed that there is a positive relationship between public sector motivation and organizational commitment. Similarly, employee's commitment has significant positive influence on their performance. Lama (2013) analyzed the quality of work life among the employees of commercial banks. The empirical result revealed that joint venture and privately owned banks have almost similar results than the public banks in terms of employee's perception towards the factors influencing the quality of work life. The result also revealed that organizational culture, employee relation, adequate and fair compensation, safe and healthy working environment, opportunity to develop human capacity, growth and lastly autonomy respectively play most influencing role on quality of work life. Deetz (2001) examined two ways of seeing and defining internal communications. The most common approach focuses on internal communication as a phenomenon that exists in organizations. The study revealed that internal communication has greater impact on employee performance in organization. Berlo (1960) analyzed the relationships between source and receiver and suggested that the more highly developed the communication knowledge and skills of sources and receivers, the more effectively the message would be encoded and decoded. The study revealed that highly developed communication is less effective in organization as it needs highly skilled manpower.

The above discussion reveals that there is no consistency in employee performance with working condition of employee. The main objective of the study is to examine the factors affecting the performance of employees at work place in Nepalese commercial banks. Specifically, this study examines the impact of e Motivation, motivation environment, working environment, communication and team work. The remainder of this study is organized as follows: Section two describes the sample, data and methodology. Section three presents the empirical results and final section draws the conclusion and discuss the implication of the study findings.

**2. Methodological aspects:** This study is based on primary data which were gathered from the 100 respondents from 16 commercial banks in Kathmandu valley which mainly deals with the performance of employees at work place.

Table 1 shows the number of commercial banks selected for the study along with the study period and number of observations.

**Table 1: List of commercial banks along with the number of observations**

Name of banks	No of respondents
1 Nepal Bank Limited	5
2. RastriyaBanijya Bank	5
3. Everest Bank Limited	10
4Himalayan Bank Limited	10
6. Nepal SBI Bank Limited	10
7. Nabil Bank Limited	5
8. Standard Chartered Bank	5
9. Nepal Investment Bank Limited	5
10. Kist Bank Limited	5
11. NIC Asia Bank Limited	5
12. Kumari Bank Limited	10
13. Global IME Bank Limited	5
14. Siddhartha Bank Limited	5
15. Citizen Bank Limited	5
16. Prabhu Bank Limited	5
<b>Total number of observations</b>	<b>100</b>

Thus, this study is based on 100 observations.

### The Model

As a first approximation, this study assumes that EMP depends on several dimensions. (Motivation, motivation environment, working environment, communication and team work). Therefore, the regression model used in this study takes the following form:

$$EMP = \alpha + \beta_1 OC + \beta_2 MOT + \beta_3 WE + \beta_4 COM + \beta_5 TW + \epsilon \dots \dots \dots (i)$$

Whereas,

EMP= employee performance

OC= motivation

MOT= motivation environment

WE= working environment

COM= communication

TW= team work

$\alpha$  = Regression constant

### Motivation

According to Maehr (1997), motivation means driving employees at work for the employee performance at work place. Guven (2015) revealed that motivation has positive relationship with employee performance. Similarly, Carroll (1979) found that motivation has positive relationship with employee performance. Based on it, the study develops the following hypothesis:

*H1: There is positive relationship between motivation and employee performance.*

### Working environment

According to Taiwo (2010), working environment means striving to ensure that employee are working under proper working environment where they will accomplish their task. Diefendorff (2002) revealed that working environment has positive relationship with employee performance in organization. Similarly, Adhikari and Mueller (2004) concluded that working environment has positive relationship with employee performance at workplace. Based on it the study develops the following hypothesis:

*H2: There is positive relationship between employee performance and working environment.*

### Communication

Communication is the imparting or exchanging of information by speaking, writing, or using some other medium. According to Barnlund (2008), there is positive relationship between communication and employee performance. Sheard and Kakabadse (2004) revealed that communication has positive relationship with employee performance. Similarly, Paul (2004) concluded that communication has positive relationship with employee performance. Based on it, the study develops the following hypothesis:

*H3: There is positive relationship between communication and employee performance.*

**Team work:** Teamwork means striving to ensure that all the employees are working under strength of team to create long-term value for organizational benefits. Ahmed(2014) revealed that teamwork has positive relationship with employee performance. Similarly, Khan (2014) found that teamwork has positive relationship with employee performance. Based on it, the study develops the following hypothesis:

*H4 There is positive relationship between employee performance and team work.*

### 3. Results and discussion

**Correlation analysis:** The Pearson's correlation coefficients have been computed to analyze the strength of linear relationship between work place and employee performance and the results are presented in Table 3.1.

**Table 3.1: Pearson's correlation matrix for the EMP, MOT, WE, COM and TW**

*This table reveals the Pearson's correlation coefficients between dependent and independent variables. Employee performance (EMP) is taken as dependent variables. Motivation environment (MOT), working environment (WE), communication (COM) and team work (TW) are independent variables*

Variables	Mean	EMP	MOT	WE	COM	TW
EMP	3.01	1.000				
MOT	4.13	0.412**	1.000			
WE	3.69	0.208**	0.049**	1.000		
COM	3.72	0.191**	0.096**	0.803**	1.000	
TW	4.14	0.274**	0.137**	.175**	.121**	1.000

*Note: The asterisk signs (\*\*) and (\*) indicate that the results are significant at 1% and 5% levels respectively.*

The table shows that the average value of EMP is 3.01. Similarly, the average value of motivation, working environment, communication and teamwork are 4.13, 3.69, 3.72 and 4.14 respectively.

The result shows that motivation is positively related to EMP. This means that increased in the motivation leads to increase in the EMP of Nepalese commercial banks. Similarly, working environment is positively correlated to EMP. This indicates that betterment in the working environment leads to increase in EMP. Likewise, the result shows that communication is positively related to EMP. This indicates that betterment in the communication leads to increase in the EMP. Likewise, the result shows that teamwork is positively correlated to EMP. This means that betterment in the teamwork leads to increase in the EMP.

### 3.2 Regression analysis

Having indicated the Pearson correlation coefficients, regression equations have been computed and the results are presented in Table 3.1. More specifically, it shows the regression of impacts of working environment on employee performance.

**Table 3.2: Regression of impact of EMP, MOT, WE, COM and TW on EMP**

*The result is based on 100 observations by using linear regression model. The model is  $EMP = \alpha + \beta_1 OC + \beta_2 MOT + \beta_3 WE + \beta_4 COM + \beta_5 TW + \epsilon$ , where, dependent variable is employee*

performance (EMP)). Independent variables are motivation (MOT), working environment (WE), communication (COM) and team work (TW).

Model	Intercept	MOT	WE	COM	TW	Adj. R <sup>2</sup>	SEE	F-value
1	2.409 (18.548)**	0.265 (7.234)**				0.354	0.206	53.64**
2	2.540 (14.582)**		0.230 (4.679)**			0.183	0.232	21.89**
3	2.554 (14.208)**			2.229 (4.454)**		0.168	0.234	19.83**
4	2.157 (10.732)**				0.343 (5.956)**	2.266	0.220	35.47**
5	2.157 (10.732)**					0.134	0.239	35.47**
6	2.129 (9.597)**			0.189 (3.697)**		0.241	2.225	15.39**
7	2.063 (9.339)**		0.198 (4.139)**			0.264	0.221	17.38**
8	1.946 (8.740)**				0.293 (4.735)**	0.297	0.216	20.44**
9	1.555 (7.525)**	0.196 (7.525)**	0.032 (0.297)**	0.063 (0.593)**	0.146 (2.287)**	0.494	0.186	18.33**

Note: The asterisk signs (\*\*) and (\*) indicate that the results are significant at 1% and 5% levels respectively.

The table shows that beta coefficient is positive for the motivation. It indicates that higher the motivation to the employees, higher would be employee performance. Similarly, the beta coefficient is positive and significant for working environment. This means that better the working environment, better would be employee's performance at work. This finding is consistent with the findings of Pheng and Chuan (2006). Likewise, the regression shows that beta coefficient is positive for communication. It means that better the communication leads to higher employee performance. This finding is consistent with the findings of Guest (1997). Similarly, the beta coefficient for teamwork is positive and significant. It means that better the teamwork leads to increase in performance of employees at work. This finding is similar to the findings of Smith (2010).

**4. Summary and conclusion:** Creating a work environment which promotes wellbeing of employees and increase individual performance is viewed as a strategy for enhancing company efficiency and productivity. Employee's normally have expectation and will demand a workplace environment that facilitates them to perform their work optimally. When this is sufficiently provided, it can boost organizational competitiveness. Bank institutions make significant investments in designing, building and ultimately recruiting knowledgeable personnel. This study attempts at determining impact employee performance at work place in the Nepalese commercial banks. This study is primarily based on primary sources of data collected from the 100 respondents. This study hypothesizes that the employee's performance depends on several factors such as motivation, communication, teamwork and working environment. The correlation analysis shows that motivation, teamwork, communication and working environment are positively related employee's performance. It reveals that higher the motivation at work, higher would be employee's performance. This also indicates that higher the teamwork, better would be the employee's performance. The regression analysis shows that motivation, teamwork, working environment and communication have positive impact on employee's performance. This indicates that

increase in motivation leads to increase in the employee's performance. Similarly, betterment in working environment leads to increase in performance of employees at work place.

*Kale Sachin Vijay & Dr. Vasudha V. Purohit (127-129)*

## **A GLANCE FDI IN SERVICE SECTOR IN INDIA**

**Kale Sachin Vijay & Dr. Vasudha V. Purohit**

<sup>1</sup>*Research Student (Ph.D.), Dr. Babasaheb Ambedkar Marathwada, University, Aurangabad.*

<sup>2</sup>*Principal, Head & Research Guide, Department of Economics, Dr. Sow.I.B.P. Mahila College, Aurangabad.*

**Introduction:-** Broadly, foreign direct investment includes "mergers and acquisitions, building new facilities, reinvesting profits earned from overseas operations, and intra company loans". In a narrow sense, foreign direct investment refers just to building new facility, and a lasting management interest in an enterprise operating in an economy other than that of the investor. FDI is the sum of equity capital, long-term capital, and short-term capital as shown in the balance of payments. FDI usually involves participation in management, joint-venture, transfer of technology and expertise. FDI, a subset of international factor movements, is characterized by controlling ownership of a business enterprise in one country by an entity based in another country. Foreign direct investment is distinguished from foreign portfolio investment, a passive investment in the securities of another country such as public stocks and bonds, by the element of "control". According to the Financial Times, "Standard definitions of control use the internationally agreed 10 percent threshold of voting shares, but this is a grey area as often a smaller block of shares will give control in widely held companies.

**A glance FDI in service Sector:-** FDI inflows into the services sector rose by about 26 per cent to \$8.68 billion in 2016- 17 with the government taking steps to improve the ease of doing business and attracting foreign investments. The sector, which includes banking, insurance, outsourcing, R&D, courier and technology testing, had received Foreign Direct Investment (FDI) worth \$6.89 billion in 2015-16, according to data of the Department of Industrial Policy and Promotion (DIPP). The government has taken several measures such as fixing timeliness for approvals and streamlining procedures to improve ease of doing business in the country and attract foreign investments. With FDI growth in key sectors like services and telecom, the overall foreign investment inflows in the country too increased by 9 per cent to \$43.5 billion last fiscal. Increasing foreign inflows in the services sector assumes significance as it contributes over 60 per cent to India's GDP. The sector accounts for about 18 per cent of the total FDI, India has received during April 2000 and March this year. It was followed by key sectors such as computer software and hardware, construction development and telecommunications. To further boost inflows in the sector, the government is considering relaxation of policy in areas like single brand retail trading, multi-brand retail trading, print media and construction. The government is also focusing on enhancing services exports. Services exports have been a dynamic element of India's trade and globalization in recent years. India's services export grew from 16.8 billion US\$ in 2001 to 155.6 billion US \$ in 2014 which constitutes 7.5% of the GDP making the country the 8<sup>th</sup> largest services exporter in the world. The overall openness of the economy reflected by total trade including services as a percentage of GDP shows a higher degree of openness at 50% in 2014-15 compared to 38% in 2004-05. India's Services Import at 81.1 billion US\$ grew by 3.3% in 2014-15. The Government has taken policy initiatives to promote services exports which include the Service Export from India Scheme (SEIS) and organizing Global Exhibition on Services (GES).

**Tourism:-** Tourism is a major engine of economic growth, and a generator of employment of diverse kinds. According to Economic Survey India's tourism growth which was 10.2% in terms of foreign Tourist Arrival (FTA) and 9.7% in terms of foreign exchange Earnings (FEE) in 2014 decelerated to 4.5% in terms of FTAs and fell by 2.8% in terms of FEEs in 2015. The lower growth in FTAs and fall in FEEs

in 2015 is due to negative or low growth in FTAs from high spending tourists originating from European countries like France, Germany and UK. However, domestic tourism continues to be an important contributor to the sector providing much needed resilience. In 2014 it grew by 12.9%. The top five states in domestic tourist visits in 2014 are Tamil Nadu, Uttar Pradesh, Karnataka, Maharashtra and Andhra Pradesh. In 2014-15, Government has launched two schemes for thematic development of tourism, these are Swadesh Darshan and National Mission on Pilgrimage Rejuvenation and Spiritual Augmentation Drive (PRASAD). To promote medical tourism, the Government has launched India's Healthcare Portal and Advantage Health Care India.

**Shipping & Port Services:-** Around 95% of India's trade by volume and 68% in terms of value is transported by sea. As per UNCTAD, India with 11.7 million twenty-foot equivalent units of container (TEUs) and a world share of 1.7%, ranked ninth in 2014 among developing countries in terms of containership operations. A vision for coastal shipping tourism and regional development has been prepared with a view to increasing the share of the coastal/inland water-ways transport mode from 7% to 10% by 2019-20. The cargo traffic of India ports increased by 8.2% to 1052.21 million tonnes in 2014-15. In India's Maritime Agenda, the target for the year 2020 is 3130 million tonnes of port capacity with an investment of approximately Rs. 2,96,000/- crores.

**IT-BPM Services:-** The IT-BPM sector has demonstrated flexibility and as per the Economic Survey is expected to touch an estimated share of 9.5% of GDP and more than 45% in total services export in 2015-16. E-commerce is expected to grow at 21.4% in 2015-16 to reach 17 billion US\$. India home to a new breed of young start ups has clearly evolved to become the third largest base of technology start ups in the world. Within one year the number of start ups have grown by 40% creating 80,000-85,000 jobs in 2015. This emerging sector is set to get up a fillip with the Startup India programme.

**Research and Development Services:-** As per the CSO's (Central Statistical Organization) new method there is no separate head for R&D, it is a part of the professional scientific & technical activities including R&D which grew at 3.8% and 25.5 respectively in 2013-14 and 2014-15. According to the Survey, India's R&D globalization and services market is set to almost double by 2020 to 38 billion US\$.

**Consultancy Services:-** According to the Survey Consultancy Services is emerging as one of the fastest growing service segments in India. Government has taken several initiatives like the Marketing Development Assistance and Market Access Initiative Scheme among others for capacity development of domestic consultants.

**Real Estate and Housing:-** This sector constituted 8.0% of the India's GVA (Gross Value Added) in 2014-15 and grew by 9.1%. The sector has grown at a CAGR of 8.1% since 2011-12. However, the construction sector has witnessed a slowdown in last few years due to weakening of both domestic and global growth. The Government has announced plans to build six crore houses by the year 2022 under the Housing for All scheme.

**Internal Trade:-** According to the Survey, Rs. 12,31,073 crore trade and repair services sector, with a 10.7% share in GVA, grew by 10.8% in 2014-15. India's retail market is expected to grow to 1.3 trillion US\$ by 2020 making India the world's fastest growing major developing market. The E-commerce market in India is expected to reach 16 billion US\$ by the end of 2015 on the back of growing internet population and increased online shoppers.

**Media and Entertainment Services:-** According to the Economic Survey, the industry has recorded unprecedented growth over the last two decades making it one of the fastest growing industries in India. It is projected to grow at a CAGR of 13.9% to reach 1964 billion rupees by 2019. Digital advertising and gaming, which grew by 44.5% and 22.4% respectively in 2014, are projected to drive the growth of this sector in the coming years.

**Postal Services:-** India Posts is the largest Postal network in world. Towards financial inclusion, the number of post office savings bank (POSB) accounts has increased from 30.86 crore to 33.97 crore and total deposits in POSB accounts and cash certificate to Rs. 6.53 lakhs crore in the last one year. More than 80 lakh Sukanya Samridhi Yojna accounts have been opened. The IT Modernization Project of the Department of Posts, with a total outlay of Rs. 4909 crore, involves computerization and networking of all the post offices.

**Merits of FDI:-**

- 1) More consumer savings:-One of the biggest advantage of FDI is that it will increase the savings of Indian consumer as he will get good quality products at much cheaper rates. Consumer savings are likely to increase 5 to 10% from FDI.
- 2) Higher remuneration for farmers:-Another advantage of FDI is that it will help a lot in improving the miserable condition of Indian farmers who are committing suicides on daily basis because of lesser return from their agricultural produce. But FDI will certainly help a lot in improving their conditions as the farmers are going to get 10 to 30% higher remuneration because of FDI.
- 3) Increase in employment opportunities:-FDI is certainly going to increase the employment opportunities in India by providing around 3 to 4 million new jobs. Not only this another 4 to 6 million jobs will be created in logistics, labour etc. because of FDI.
- 4) Increase in government revenue:-Government revenues are certainly going to increase a lot because of FDI. Government revenues will increase by 25 to 30 billion dollars which is a really big amount. This government revenue can help a lot in the development of Indian economy.

**Demerits of FDI:-**

- 1) Destruction of small entrepreneurs:-The biggest fear from FDI is that it is likely to destroy the small entrepreneurs or small kirana shops as they will not be able to withstand the tough competition of big entrepreneurs as these entrepreneurs are going to provide all the goods to the consumers at much lesser prices.
- 2) Shrinking of jobs:-Many critics of FDI are of the view that entry of big foreign chains like Wal-Mart, Carrefour etc. are not going to generate any jobs in reality in India. At best the jobs will move from unorganized sector to organized sector while their number will remain the same or lesser but not more.
- 3) No real benefit to farmers:- Critics of FDI are also of the view that it is a fallacy that the farmers are going to benefit in any way because of the entry of foreign chains in India rather it will make the Indian farmers a slave of these big chains & the farmers will entirely be on their mercy. Thus, FDI is only going to deteriorate the already miserable conditions of Indian farmers.

**Conclusion:-** After taking into consideration both merits & demerits of FDI one can safely say that although there are certain apprehensions about FDI in India but all these fears are unfounded. There is hardly any truth in the fact that it would destroy the small entrepreneurs in India rather it will be beneficial for both the consumers & farmers of India. So, the future of India lies in FDI & the government must proceed in that direction if it wants to make the Indian economy a developed economy.

## **IMPACT OF GST ON INDIAN ECONOMY**

**Dr. S. S. Patange**

*Department of Economics, Bahirji Smarak Mahavidyalaya, Basmatnagar, Dist. Hingoli (M.S.)*

**INTRODUCTION:** GST is consumption based tax levied on sale manufacture and consumption of goods and services at national level. This tax will be suitable for all indirect tax levied by state and central government. Export and direct tax like income tax, corporate tax and capital gain tax will not be affected by GST. GST would apply to all goods other than crude petroleum, diesel, aviation turbine fuel and natural gas. It would apply to all services barring a few to be specified. With the increase of international trade in services, GST has become a global standard. The proposed tax system will take the form of “Dual GST” which is concurrently levied by central and state government. This will comprise of

- \* Central GST (CGST) - which will be levied by central government
- \* State GST (SGST) - which will be levied by state
- \* Integrated GST (IGST) - which will be levied by central government on interstate supply of goods and services

The GST will bring about a qualitative change in the tax system by redistributing the burden of taxation equitably between manufacturing and services. The finance commission had studied by NCAER to assess its impact on GDP growth and exports. The study explains the impact of GST on growth through cost reduction as well as cost reduction of capital inputs. Preliminary results indicate that the growth in GDP can be between 2-2.5% with the implementation of well designed GST. The increase in exports can be between 10-14%. It is indeed a staggering impact and demands energetic actions to use in well designed GST.

For GST to be successful all the states and the centers should implement it in a similar fashion. Only then it will bring about the national commerce market. The GST will perhaps be the single most important stimulus since 1991-92. A flawless GST and the new direct taxes code will put India's fiscal system on cutting edge of the world market economies. Even a 2% reduction in cost increases the profit by 20%. This will attract investment. As tax cascading disappears, the industry will move the lagging regions because of lower cost and thus bring them in growth dynamics.

### **Objectives of the Study:**

- To understand the Concept of Goods and Service Tax
- To understand the Merits and Demerits of implementing GST in India
- To understand the features of GST
- To understand the implications of implementing GST in India

**Research Methodology:** The information in the study is collected from secondary sources that is from various online sources, websites, articles related to Goods and Service Tax.

### **Salient Features of the GST:**

Following are the salient features of GST Model:

1. The GST shall have two components: one levied by the Centre (here in after Referred to as Central GST), and the other levied by the States (here in after Referred to as State GST). Rates for Central GST and State GST would be prescribed appropriately, reflecting revenue considerations and acceptability.
2. The Central GST and the State GST are to be paid to the accounts of the Centre and the States separately
3. The Central GST and the State GST would be applicable to all transactions

of goods and services made for a consideration except exempted goods and services, goods which are outside the purview of GST.

4. Since the Central GST and the State GST are to be treated separately; taxes paid against the Central GST shall be allowed to be taken as input tax credit (ITC) for the Central GST and could be utilized only against the payment of Central GST. The same principle will be applicable for the State GST.

5. The administration of Central GST to the Centre and for State GST to the States would be given.

6. To the extent feasible, uniform procedure for collection of both central GST and the State GST would be prescribed in the respective legislation for the Central GST and the State GST.

#### **Impact of GST on Indian Economy:**

Like every coin has two sides; even GST will probably have its own Positives and negative impacts:

- CST
- Entertainment
- Lottery, Betting, Gambling
- Entry (State)
- Octori
- Utilities
- Surcharge

India is opting for Concurrent Dual system GST i.e. Central Goods and Services Tax (CGST), State Goods and Services Tax (SGST) and Integrated Goods and Services Tax (IGST).

Indirect taxes like service tax, excise and custom duties and CST will be subsumed into CGST and State sales tax, VAT, entertainment and professional taxes will be involved as SGST. These taxes are levied as the place of consumption of goods and services as:

- Intra-state production and consumption of goods and services,
- Inter-state production and consumption of goods and services, and
- Import of goods and services.

#### **Positive Aspects of GST:**

1. The main reason to implement GST is to abolish the cascading effect on tax. A product on which excise duty is paid can also be liable to VAT. Suppose a product A is manufactured in a factory. As soon as it releases from factory, excise duty has to be paid to central government. When the product A is sold in same state then VAT has to be paid to the State Government. Also no credit on excise duty paid can be taken against output VAT. This is termed as cascading effect since double taxes is levied on same product.

2. GST will lead to more transparent and neutral manner to raise revenue.

3. Implementation of GST will help resolve various issues concerning taxation and logistics with regard to e-commerce business, which has been recording rapid growth in the country, says a study.

4. Simplified and cost saving system as procedural cost reduces due to uniform accounting for all types of taxes. Only three type of account; CGST, SGST & IGST have to be maintained.

5. GST is structured to simplify the current indirect system. It is a long term strategy leading to a higher output, more employment opportunities and economy boom.

6. It is beneficial for both economy and corporations. The reduced tax burden on companies will reduce production cost making exporters more competitive.

7. GST will reduce transaction costs for taxpayers through simplified tax compliance.

8. It will result in increased tax collections due to wider tax base and better conformity.
9. For the Centre and the States: According to experts, by implementing GST, India will gain \$ 15 Billion a year. This is because it will promote more exports, create more employment opportunities and boost growth.
10. For individuals and companies: In the GST system, taxes for both Centre and State will be collected at one point of sale. Both will be charge on manufacturing cost. Individuals will be benefited by this as prices are likely to come down. Lower price mean more consumption, more consumption means more production
11. The implementation of GST will make industry more competitive through dismantling of the complex indirect tax structure and boost the tax revenue of states and thereby helping in the growth of the companies.

#### **Negative Aspects of GST:**

There are following negative aspects of Goods and Services Tax (GST):

1. Majority of dealers are not covered with the central excise but are only paying VAT in the state. Now all the VAT dealers will be required to pay Central Goods and Services Tax (CGST).
2. GST is referred as single taxation system in India but in reality it is a dual tax in which both state and centre collects separate tax on single transaction of sale & service. However GST has some negative aspect but at the end it will boost economy.
3. GST would impact negatively on the real estate market. It would add up to 8 percent to the cost of new homes and reduce demand by about 12 percent.
4. Service tax litigations have risen substantially in recent years and that may be because of the absence of a pan-India Goods and Services Tax (GST) regime that can potentially remove several ambiguities around indirect taxation, experts maintain.

#### **HOW IS GST BENEFICIAL FOR INDIA?**

Let's say a truck is moving stuff from Delhi to Chennai, it will pass through about 8 states. During that time it will pay a variety of taxes, VAT, excise duties and so on. Each sources of tax collection is a source of confusion, corruption and delay. By the time the truck arrives at the destination in a couple of weeks, a huge amount of cost is indirectly added to consumer. Instead of India being a common economy we are a patchwork of dozens of economies, making growth slow, business impossible and corruption high. This problem has to be recognized by the developed economies and all progressive ones- like Sweden, Denmark, Switzerland, Germany, Japan, have moved a common GST to provide one common window for tax collection. With just one place of collecting taxes, there own to be much delay and corruption. The single place tax collection will drastically improve amount of revenues collected and help business grow at the same time.

#### **WHO GETS TO LOSE?**

All the *babus* and the police who are in the middle and used to collect random taxes and bribes from their businesses will lose if the taxes are streamlined. Even some businesses that are built around *babus* connection will lose as their competitors can grow without much political connections. The middle man is ultimate power in India whether it is *kiranas* blocking retail reforms are blocking GST through a variety of tactics and given that consumers are *sheep with no voice* for themselves reform will slip.

**Importance of GST:** By implementing the GST, India will gain \$15 billion a year. This is because it will promote more exports, create more employment opportunities and boost growth. It will divide the burden of tax between manufacturing and services. Some of the important ways in which it will be enable the growth of economy are-

1. **United market:** The GST will cut down the large number of taxes imposed by central government (e.g. Central VAT or excise duty, service tax, central sales tax, etc.) and states (VAT on sales ,

entertainment tax, luxury tax and entry taxes levied by municipalities). This will lead the creation of unified market which would facilitate seamless movement of goods across state and reduce the transaction cost of business.

**2. Lower tax evasion:** Currently company has to pay taxes on the entire underlying value of the product/services. But under GST companies in chain will have to pay tax only on the tax addition. So the actual tax paid will be likely small and reduce the incentive for evasion. The elimination of many taxes will increase compliances.

**3. Logistic tax will fall:** The multiple check points, collection of taxes and interstate levy of 2% at state borders will reduce, thereby, making movement from one state to another state easy and cheaper.

**4. Boost investment and export:** Certain capital goods are not to be considered while providing input tax credit. Input tax credit is given to organizations so that they only pay tax on the value that they add to a certain raw material. Essentially GST will cover all kind of capital goods and investments and hence more capital is expected to be pumped in economy.

**5. Online transaction under GST transit:** This allows getting more money under taxation system and raising collection for the centre and state exchequers.

**6. Make In India** It will get a huge boost as both tax and logistics will fall and lead to higher investments for manufacturing industry.

**7. Increase competitiveness:** Elimination of cascading and easier compliance will increase the ease of doing business.

**Conclusion:** In simple, GST would definitely be a positive for manufacturing sector and Negative for service sectors, as the present tax rate for manufacturing is way higher than proposed GST tax rate and for services, proposed GST will be a higher rate of tax. GST is definitely a good move to reform indirect taxation in India and has positive effects on GDP growth, Tax revenue, exports, employment and so many. But even after a decade Government have failed to implement it, due to variety of reasons like, compensation mechanism for the states, GST rates, and issues relating to food products, petroleum, and tobacco and many political issues as well. With lots of flaws in the present tax structure which is affecting the growth of economy, there is a need to implement GST and to streamline our growth with global economy. The implementation of GST would pave way for a simple and understandable tax structure, and also help in avoiding any evasion taking place at any level. Thus, lot being said and done, an appropriate implementation would lead to actually understand whether "GST is a boon or bane Tax policies play an important role on the economy through their impact on both efficiency and equity. A good tax system should keep in view issues of income distribution and, at the same time, also endeavor to generate tax revenues to support government expenditure on public services and infrastructure development. The ongoing tax reforms on moving to a goods and services tax would impact the national economy, International trade, firms and the consumers There has been a good deal of criticism as well as appraisal of the proposed Goods and Services Tax regime. It is considered to be a major improvement over the pre-existing central excise duty at the national level and the sales tax system at the state level, the new tax will be a further significant breakthrough and the next logical step towards a comprehensive indirect tax reform in the country. GST is not simply VAT plus service tax, but a major improvement over the previous system of VAT and disjointed services tax – a justified step forward. A single rate would help maintain simplicity and transparency by treating all goods and services as equal without giving special treatment to some 'special' goods and/or services. This will reduce litigation on classification issues. It is also expected that implementation of GST in the Indian framework will lead to commercial benefits which were untouched by the VAT system and would essentially lead to economic development. Hence GST may guide in the possibility of a collective gain for industry, trade, agriculture and common consumers as well as for the Central Government and the State Government. Sooner or later, the GST will

surely knock the doors of India. And when that happens, we as future torch bearers of the profession are required to be prepared and fully equipped with our knowledge regarding GST. Forewarned is forearmed. Thus, we must be ready to deal with GST and many other changes that are going to take place in India. Slowly, India shall move to join the world wide standards in taxation, corporate laws and managerial practices and be among the leaders in these fields.

## **DEMONETIZATION OF INDIAN CURRENCY AND IMPACT ON INDIAN ECONOMY**

**Dr. Pramodini Vitthal Kadam**

*Assistant Professor in Economics, S.M.B.S.T. College, Sangamner, Tal- sangamner,  
Dist- Ahmednagar, State- Maharashtra.*

### **What is 'Demonetization' –**

Demonetization is the act of stripping a currency unit of its status as legal tender. It occurs whenever there is a change of national currency: The current form or forms of money is pulled from circulation and retired, often to be replaced with new notes or coins. Sometimes, a country completely replaces the old currency with new currency.

### **Purpose & Cause of 'Demonetization'**

There are multiple reasons why nations demonetize their local units of currency:

- to combat inflation
- to combat corruption and crime (counterfeiting, tax evasion)
- to discourage a cash-dependent economy
- to facilitate trade

**Examples of Demonetization In the world :** The Coinage Act of 1873 demonetized silver as the legal tender of the United States, in favor of fully adopting the gold standard. Several coins, including two-cent piece, three-cent piece, and half dime were discontinued. The withdrawal of silver from the economy resulted in a contraction of the money supply, which subsequently led to a five-year economic depression throughout the country. In response to the dire situation and pressure from farmers and silver miners and refiners, the Bland-Allison Act remonetized silver as legal tender in 1878. An example of demonetization for trade purposes occurred when the nations of the European Union officially began to use the euro as their everyday currencies in 2002. When the physical euro bills and coins were introduced, the old national currencies, such as the German mark, the French franc and the Italian lira were demonetized. However, these varied currencies remained convertible into Euros at fixed exchange rates for a while to assure a smooth transition. In 2015, the Zimbabwean government demonetized its dollar as a way to combat the country's hyperinflation, which was recorded at 231,000,000%. The three-month process involved expunging the Zimbabwean dollar from the country's financial system and solidifying the U.S. dollar, the Botswana pula and the South African rand as the country's legal tender in a bid to stabilize the economy.

**India's Demonetization:** In 2016, the Indian government decided to demonetize the 500- and 1000-rupee notes, the two biggest denominations in its currency system; these notes accounted for 86% of the country's circulating cash. With little warning, India's Prime Minister Narendra Modi announced to the citizenry on Nov. 8 that those notes were worthless, effective immediately – and they had until the end of the year to deposit or exchange them for newly introduced 2000 rupee and 500 rupee bills. Chaos ensued in the cash-dependent economy (some 78% of all Indian customer transactions are in cash), as long, snaking lines formed outside ATMs and banks, which had to shut down for a day. The new rupee notes have different specifications, including size and thickness, requiring re-calibration of ATMs: only 60% of the country's 200,000 ATMs were operational. Even those dispensing bills of lower denominations faced shortages. The government's restriction on daily withdrawal amounts added to the misery, though a waiver on transaction fees did help a bit.

**Impact of Demonetization on the Economy**

**1) GDP Growth:** India's GDP which grew at 7.6% in FY 2015-16 is likely to **slow down by 0.5% to 1.5%** as per reports of various agencies. This is due to less availability of cash in **cash-intensive sectors like manufacturing and real estate**. Even the automobile industry which was growing rapidly earlier has seen a contraction in the October-December quarter of 2016. Purchasing power of consumers has been negatively affected due to cash not being readily available. We need to remember that Indian economy is largely cash driven with **more than 90% transactions taking place in cash** and digital transactions accounting for just the remaining 10 percent. Banks have also been focusing on the single task of deposit and withdrawals with the result that their **core function of issuing loans has been adversely affected**. Also current account customers, who are largely business owners, need large amounts of cash at short notice have not been able to access cash and credit owing to restrictions on withdrawals and inability of banks to focus on the task of issuing loans.

**2) Tax Compliance:** India's **tax-to-GDP ratio is quite low at 16.6%** compared to other emerging economies. It is estimated that since more money, including black money, gets accounted for this will lead to **better tax compliance** owing to better targeting of income. The positive impact could be **lower tax rates as the tax base widens** and more people start paying taxes. The digital push of the government will also result in **higher indirect tax revenue** for the govt. in the form of service tax. Moreover businesses that under-reported their revenue earlier, will have to make proper disclosure, especially, of revenue received through digital or cashless means.

**3) Small and Medium-sized Enterprises (SMEs):** The small and medium-sized enterprise (SME) sector, as we understand, is a big chunk of the economy, contributing to eight percent of the GDP whilst employing more than 80 million people year on year. The labor wages in this sector are largely paid in cash and **wages have been adversely affected** by the Demonetization move. Unemployment has also been reported owing to decline in demand of SME goods as the purchasing power of the consumers has contracted in the short term. Other sectors within the SME space like **restaurants and transport operators have also been negatively impacted** since economic activity has declined and also due to the fact that there is high tendency in this segment to accept payments through cash only. Wholesale vegetable markets have been witnessing declining demand and prices of tomatoes and other food items have fallen drastically making it economically unviable for the farmers to produce these crops. Which takes us to the next point.

**4) Agriculture sector:** This is one sector where all transactions are in cash and, given the values involved, involve the higher denomination notes. The withdrawal of the old currency notes has put **pressure on the mantis**; farmers are having problems in selling their produce as both the parties have to agree on the mode of payment. Also since there is acute shortage of Rs 500 denomination notes presently, **change for the high denomination Rs 2000 notes is not readily** available with the vegetable and fruit vendors. This is also taking the buyers away from these vendors to big retail markets thus impacting the livelihood of the unorganized sector.

**5) Employment Generation:** Since consumer demand has slowed and consequently industrial production has declined, **employment generation has been adversely impacted** by the currency Demonetization drive. Since the manufacturing sector which accounts for the highest employment of skilled and semi-skilled laborers, is witnessing slowdown in production; not only less jobs are being created but lay-offs are also taking place at a higher rate. As per this report, Industry is staring at temporary job losses due to Demonetization, as production gets hit, especially in labor-intensive sectors like textiles, garments, leather and jewellery. As many as 4 lakh people, mostly daily wagers, may have either lost their jobs or shunned work temporarily due to the lack of payment so far, and the number is only going to grow if the cash crunch persists.

**6) Impact of Demonetization on Black Money:** As outlined in the first post on What is Demonetization of Currency, fighting black money rampant in the economy was one of the foremost objectives of this entire exercise and we will discuss in detail whether this objective was realized or not. If you read the above post, you will know that **cash component forms just 6% of the black money** in the Indian economy and currency demonetization will target just this 6% black income. If various reports are anything to go by, **most of this black income has been converted into white** by depositing it in Jan Dhan accounts, depositing in individuals own accounts by breaking into smaller chunks, by exchanging for new currency notes through hawala dealers, by buying last-minute luxury items like jewelry and high priced mobiles, by paying advance wages to employees etc. This is supported by the fact that almost the entire amount of Rs 14.18 lac crores in Rs 500 and Rs 1000 currency denominations lying with the public has returned to the banks at the time of writing this post. This implies that the dividend which the govt. has been hoping for by way of 2-3 lac cores not returning to the banking system (since it is black money and/or counterfeit currency) has turned out to be a mirage. Also as per various announcements by the govt. from time to time that deposits by housewives and those exempt from tax will not be scrutinized has provided a way out for black money hoarders to convert their money into white. However there have also been some positive impacts like one time **removal of counterfeit or fake currency from the economic system**. Some people argue that since black money has reduced, prices of black money intensive sectors like real estate and gold jewelry will go down. This remains to be seen. But Demonetization cannot and will not prevent future generation of black money since black money problem is more of a cultural mindset in India than a legal problem. It will also be easier for the corrupt and black money hoarders to deal in Rs 2000 currency notes as compared to Rs 500 and Rs 1000 notes since higher currency value can now be carried with greater ease. A total of **Rs 3185 cores in black money of which Rs 86 cores in new notes** has been seized by the Income Tax authorities since the launch of the Demonetization drive on 8th November. This implies that on the one hand black money is getting unearthed and on the other **leakage of new currency notes is taking place**; most probably through the banking system itself.

**7) Impact of Demonetization on Terror Funding and Fake Currency:** This was another stated objective of the currency demonetization drive of the government. While initial reports suggest that **terror related activities in J&K witnessed a noticeable halt** in the days following the Demonetization drive, including, stone pelting by misguided youths; the recent Nagrota attack shows that terrorism is continuing in the valley. Although the availability of cash has surely declined among the terror groups presently. The govt. also claimed that the new currency notes contain very high security features and are almost impossible to replicate. But this claim does not seem to be true since many stories of counterfeit currency have come to light since the note ban was announced on November 8th. However in the short term, **circulation of fake currency has definitely slowed down** considerably since the infrastructure set up to print fake currency notes in neighboring countries like Pakistan has been rendered useless by the Demonetization drive.

**Impact of Demonetization on Cashless Transactions:** As already explained above that cashless transactions account for only 10% of all transactions on daily basis. The government in order to divert some of the blame for the poor implementation of this demonetization exercise announced mid-way that making India a cashless or less cash economy was one of the important objectives of this demonetization drive. Towards this end, the Finance ministry, RBI and NITI Aayog announced **a host of incentives to boost cashless transactions**. This was also done to ease some of the problems that have resulted due to acute shortage of cash in the economy.

**Some of these incentives include:**

- No Service Tax on cashless transactions below Rs 2000

- Providing cash backs ranging from 0.25-0.75 percent on various transactions like paying for fuel, govt utility bills, stamp papers, property registrations etc.
  - Encouraging use of Point-of-Sale (PoS) machines and mobile wallets like PayTM by businesses and individuals
  - Reducing self-assessment tax from 8% to 6% on businesses with annual turnover of less than Rs 2 cores
  - Announcing monthly jackpots for people using cashless transactions in govt services
- And other incentives

As a result, use of mobile wallets and cashless transactions, as a whole, has **increased by about 300% since the launch of Demonetization exercise**. However we need to remember that this 300% increase is against a **very low base of digital transactions** and most of this increase has been noticed in the urban areas where people have ready access to PoS machines, internet banking, and mobile wallets. Cashless transactions are still rarely used in rural areas and in the informal sector like road side vendors, small shops, buying seeds, wage payments etc.

**Conclusion:** Demonetization of old currency notes surely has had **some positive impact** like reducing the cash flow to terror organizations, dismantling of counterfeit currency infrastructure, better income tax and indirect taxation, boost to digital economy. However, it has come at a huge social and economic cost. Sandeep Dongre writes that demonetization costs are estimated at Rs 1.28 lakh core to the economy for the 50-day time period till the end of depositing period of old currency. This includes a cost of Rs 17,000 core towards the government and the RBI for implementing the Demonetization process in India. Demonetization is a **one-time event and will not have much long term effect**. It alone is not sufficient to counter black money and corruption in the country; rather other measures are more crucial like bringing the offshore tax evaders to book whose names figure in the Panama papers, raid on benami properties, making donations to political parties open to public scrutiny and making it mandatory for all donations above Rs 2000 to political parties and religious places to be through digital means only. This entire exercise seemed more like a **carpet bombing than a surgical strike** where the vast majority of honest and law abiding citizens had to undergo terrible hardships in order to catch the few black sheep who have hoarded black money and who also managed to convert their black income into white.

**Conclusion speech:** This is one of the unique demonetization moves in the history of international economy, as it combined secrecy and suddenness and more importantly at the time when the countries is not suffering from any crisis or chaos on economic and political fronts but are in a state of absolute normalcy. All other sudden demonetizations have occurred in the context of hyperinflation, wars, political upheavals or other extreme circumstances. But the Indian economy had been growing at the fastest clip in the world on the back of stable macroeconomics and impressive set of reforms.

## **BITCOIN: A NEW CONCEPT OF CURRENCY**

**Dr. Pratap Jagannath Phalphale**

*P.G.Department of Economics, S.N. Arts, D.J.Malpani Commerce &B.N.Sarda Science College, Sangamner, Dist. Ahmednagar. 422605 Maharashtra, India.*

**Introduction:** Bitcoin is electronic currency. This fact has consequences for how people think about it and how they regard doing business with it. They expect to do business in a businesslike way. The promise of Bitcoin is that transactions will be quick and frictionless. Unlike businesses using more established and controlled currencies, they may also be anonymous. The Bitcoin protocol provides for monetary and other transactions to be tied to addresses, not identities. The ability to generate and use new addresses provides a degree of anonymity that non-technically inclined users are unlikely to pierce. The Bitcoin community points to this anonymity, often referred to as pseudonymity because it is not absolute, as an asset, a way of circumventing surveillance and cumbersome regulatory regimes. It is also considered a defense against the user profiling/data mining practiced by large merchants such as K-Mart. The original description of Bitcoin described the features of non-reversibility of payments and cryptographic verification as substitutes for more traditional forms of ensuring trust. However, the anonymity of Bitcoin transactions removes another source of trust in transactions: Knowing who you are doing business with. It opens the possibility of counter-party risk, the danger that the other person will not live up to their obligations once the money is received. For buyers, being able to know who they are buying from can increase trust and so reduce barriers to a successful purchase. Likewise, sellers whose business grows by word of mouth or who consider good will a valuable asset may wish to share information about successful transactions with the buying public. Bitcoin allows different forms of knowledge and openness from traditional forms of transaction. In the pre-cryptocurrency market, transactions are mostly anonymous and away from public view. When a buyer pays with cash, the record of the transaction contains only the amount and codes related to the items purchased. The use of a credit card creates more of a paper trail as the credit card service (i.e. Visa), the vendor and the purchaser retain records identifying both buyer and seller, as well as items and amounts. However, this information is generally not published for the world to see. Such financial records may be bought and aggregated in many ways, including scoring the credit worthiness of the buyer. They may be mined by the seller to learn much about their customers but, since virtually all companies consider financial information to be confidential, the results are not shared with customers or with other companies. Studies have shown that buyer behavior can be influenced by knowledge of seller reputation, product quality, and experiences and sentiment of previous customers. Specifically, simulations have shown that reputation systems can improve the overall quality of an online market. The Bitcoin protocol includes as a central feature, the blockchain, a public ledger of all transactions. Amounts paid, change received, and both input and output addresses are stored and cryptographically verified. The information contained therein, however, is sparse. An address is no more than a temporary identity. By intent it contains no direct links to more stable and human understandable identities. Likewise, the exact nature of the goods or services purchased is absent. As Bitcoin and associated altcoins become more mainstream and their communities attempt the leap to general acceptance, the sparsity of information may become an issue. There is some likelihood that some buyers and sellers will seek ways to leverage and augment the information on the blockchain to learn more about each other. The ability to mine the blockchain for data is part of the promise of Bitcoin. This paper explores three ways in which such augmented information could be developed, looking specifically at the case where buyers seek information about sellers and sellers voluntarily cooperate. The three cases

considered are site based systems, wallet based systems and coin based systems. Bitcoin is a cryptocurrency and worldwide payment system. It is the first decentralized digital currency, as the system works without a central bank or single administrator. The network is peer-to-peer and transactions take place between users directly, without an intermediary. These transactions are verified by network nodes through the use of cryptography and recorded in a public distributed ledger called a blockchain. Bitcoin was invented by an unknown person or group of people under the name Satoshi Nakamoto and released as open-source software in 2009. Bitcoins are created as a reward for a process known as mining. They can be exchanged for other currencies, products, and services. As of February 2015, over 100,000 merchants and vendors accepted bitcoin as payment. Research produced by the University of Cambridge estimates that in 2017, there are 2.9 to 5.8 million unique users using a cryptocurrency wallet, most of them using bitcoin.

**History of Bitcoin:** On 18 August 2008, the domain name "bitcoin.org" was registered. In November that year, a link to a paper authored by Satoshi Nakamoto titled Bitcoin: A Peer-to-Peer Electronic Cash System was posted to a cryptography mailing list. Nakamoto implemented the bitcoin software as open source code and released it in January 2009. The identity of Nakamoto remains unknown. In January 2009, the bitcoin network came into existence after Satoshi Nakamoto mined the first ever block on the chain, known as the genesis block, for a reward of 50 bitcoins. This note has been interpreted as both a timestamp of the genesis date and a derisive comment on the instability caused by fractional-reserve banking. One of the first supporters, adopters, and contributors to bitcoin was the receiver of the first bitcoin transaction, programmer Hal Finney. Finney downloaded the bitcoin software the day it was released, and received 10 bitcoins from Nakamoto in the world's first bitcoin transaction. Other early supporters were Wei Dai, creator of bitcoin predecessor b-money, and Nick Szabo, creator of bitcoin predecessor bit gold. In the early days, Nakamoto is estimated to have mined 1 million bitcoins. In 2010, Nakamoto handed the network alert key and control of the Bitcoin Core code repository over to Gavin Andresen, who later became lead developer at the Bitcoin Foundation. Nakamoto subsequently disappeared from any involvement in bitcoin. Andresen stated he then sought to decentralize control, saying: "As soon as Satoshi stepped back and threw the project onto my shoulders, one of the first things I did was try to decentralize that. So, if I get hit by a bus, it would be clear that the project would go on." This left opportunity for controversy to develop over the future development path of bitcoin. The value of the first bitcoin transactions were negotiated by individuals on the bitcointalk forums with one notable transaction of 10,000 BTC used to indirectly purchase two pizzas delivered by Papa John's. On 6 August 2010, a major vulnerability in the bitcoin protocol was spotted. Transactions were not properly verified before they were included in the blockchain, which let users bypass bitcoin's economic restrictions and create an indefinite number of bitcoins. On 15 August, the vulnerability was exploited; over 184 billion bitcoins were generated in a single transaction, and sent to two addresses on the network. Within hours, the transaction was spotted and erased from the transaction log after the bug was fixed and the network forked to an updated version of the bitcoin protocol. On 1 August 2017, a hard fork of bitcoin was created, known as Bitcoin Cash. Bitcoin Cash has a larger blocksize limit and had an identical blockchain at the time of fork. On November 12 another hard fork, Bitcoin Gold, was created. Bitcoin Gold changes the proof-of-work algorithm used in mining.

**Etymology:** The word bitcoin first occurred and was defined in the white paper that was published on 31 October 2008. It is a compound of the words bit and coin. The white paper frequently uses the shorter coin. There is no uniform convention for bitcoin capitalization. Some sources use Bitcoin, capitalized, to refer to the technology and network and bitcoin, lowercase, to refer to the unit of account. The Wall Street Journal, The Chronicle of Higher Education, and the Oxford English Dictionary advocate use of lowercase bitcoin in all cases, a convention followed throughout this article.

**Units:** The unit of account of the bitcoin system is bitcoin. As of 2014, ticker symbols used to represent bitcoin are BTC and XBT. Its Unicode character is Small amounts of bitcoin used as alternative units are millibitcoin (mBTC) and satoshi. Named in homage to bitcoin's creator, a satoshi is the smallest amount within bitcoin representing 0.00000001 bitcoin, one hundred millionth of a bitcoin. A millibitcoin equals 0.001 bitcoin, one thousandth of a bitcoin or 100,000 satoshis.

#### List of Bitcoin Companies

Company	Founded	Headquarters	Service
37coins	2013	US - Sunnyvale, California	wallet provider
Airbitz	2014	US - San Diego, California	wallet provider
ANX	2013	China - Hong Kong	bitcoin exchange
BIPS	2011	Denmark - Copenhagen	payment service provider
Bitcoin Suisse AG	2013	Switzerland - Zug	broker, asset management, trading, financial services, payment gateway services, mining
Bitcoin.com		Japan - Tokyo	bitcoin exchange, wallet provider
Bit Go	2013	US - San Francisco, California	multisignature security platform for bitcoin
Bit Instant	2011	US - New York, New York	bitcoin exchange
BitPay	2011	US - Atlanta, Georgia	payment service provider
BitPesa	2013	Kenya - Nairobi	bitcoin exchange
Bitreserve	2013	US - Charleston, South Carolina	wallet provider
Bitstamp	2011	Luxembourg	bitcoin exchange
Bitwage	2014	US - San Francisco, California	bitcoin payroll, international payroll
Bitwala	2015	Germany - Berlin	bitcoin debit card, international transfers, bitcoin wallet
BitX	2013	South Africa - Cape Town	bitcoin exchange
Blockchain.info	2011	Luxembourg	wallet provider
Blockstream	2014	US - San Francisco, California	Software
BTC Markets	2013	Melbourne, Australia	bitcoin exchange
BTC-e	2011	Russia	bitcoin exchange
Btc.sx	2013	UK - London	bitcoin exchange
BTCJam	2013	US - San Francisco, California	peer-to-peer lending
BTCS	2013	US - Arlington, Virginia	mining, wallet provider
Buttercoin	2013	US - Palo Alto, California	bitcoin exchange
CEX.IO	2013	UK - London	bitcoin exchange
ChangeTip	2013	US - San Francisco, California	Micropayments
Circle	2013	US - Boston, Massachusetts	wallet provider
CloudHashing	2013	UK - London	cloud mining
coin co	2014	US - New York, New York	payment service provider
Coinbase	2012	US - San Francisco, California	wallet provider, bitcoin exchange
CoinDesk	2013	UK - London	News
Coinfloor	2013	UK - London	bitcoin exchange

Coinify	2014	Denmark - Copenhagen	payment service provider, bitcoin exchange
Coins.ph	2014	Philippines - Metro Manila	wallet provider
Digital Asset Holdings	2014	US - New York, New York	blockchain financial services
Gatecoin	2013	China - Hong Kong	bitcoin exchange
General Bytes	2013	Czech Republic - Prague	bitcoin ATM and point of sale (POS) manufacturer
Ghash.io	2013	UK - London	mining pool
HashCash Consultants	2015	US - Fremont	blockchain based banking applications, bitcoin payment processor, exchange
Huobi	2013	China - Beijing	bitcoin exchange
LibertyX	2013	US - Boston, Massachusetts	cash-based bitcoin exchange
LocalBitcoins	2012	Finland - Helsinki	over-the-counter trading
Magnr	2015	UK - London	trading, savings and investment platform
Mt. Gox	2010	Japan - Tokyo	bitcoin exchange
OKCoin	2013	China - Beijing	bitcoin exchange
Pantera Capital	2003	US - San Francisco, California	venture capital
R3	2014	US - New York, New York	blockchain financial systems
Satoshi Citadel Industries	2014	Philippines - Makati	holding company
SatoshiDice	2012	Undisclosed	Gambling
SearchTrade	2015	Singapore	Search Engine
ShapeShift	2013	Switzerland	Digital currency exchange
Tidbit	2013	US - Boston, Massachusetts	Mining
Wirex	2015	UK - London	bitcoin debit card, remittances, mobile banking
Xapo	2014	Switzerland - Zürich	wallet provider, bitcoin exchange, vault, debit card

### Bank of England Could Issue “Bitcoin-style Digital Currency” in 2018

The Bank of England might have “its own Bitcoin-style digital currency” this year, according to the country’s legacy media. The more than three hundred year old bank set up a research unit back in 2015 to investigate linking a state-backed crypto to sterling, and there appears to be a breakthrough. Perhaps foreshadowing The Telegraph scoop, he ended his remarks, “What I say on this topic today will be outdated six months from now because things are moving so rapidly.” Indeed, the English paper began its coverage of the topic with the opening, “The Bank of England could green light its own Bitcoin-style digital currency as early as 2018, The Telegraph can disclose.” With meetings continuing at the beginning of the next year, he confirmed “I have participated in discussions with the major central banks on this issue” of a central bank-backed digital currency. And over the summer the Bank of England used blockchain technology as a test to see if it could be used as settlements between central banks. It was successful. “The underlying technology is actually of a fair bit of interest. We are working with it at the Bank of England,” he reportedly explained to the Treasury Select Committee. In the Spring of last year, the Bank of England commissioned Dr. George Danezis of the University College London to devise a cryptocurrency with state-assumed backing. RS Coin was born, and it did seem to add efficiencies associated with automation as it relates to banking purposes: central banks could easily control the money supply at any given time, and could obviously determine the amount of money in circulation. Though Mr. Carney probably believes the potential Bank of England digital token would be used only between central banks, The Telegraph reports a “research unit set up by the Bank is investigating the possible introduction

of a cryptocurrency linked to sterling.” It’s hard to imagine traditional retail banks allowing this to happen, as it would surely be their death. A world of frictionless, snap-of-the-fingers transacting for houses, cars, etc. is not something legacy banking could survive.

**Conclusion and Future Research:** Each of the systems described has strengths and weaknesses. None is a complete solution to the need for information about sellers. The structure of the Bitcoin protocol intentionally makes this difficult. The ease with which addresses are created and discarded makes it relatively simple for buyers and sellers, both, to maintain several identities for transactions, or to simply disappear into the blockchain, their Bitcoin balances known but never their habits. Therefore in each of the three systems the question of seller identification was touched on. The fact remains that honest sellers do have an incentive to allow themselves to be rated. Particularly within the context of an anonymous system like Bitcoin, the simple fact of submitting to ratings demonstrates a degree of good faith. As described above, web-based rating systems for Bitcoin transactions already exist. Web sites, however, maintain their own infrastructure for doing so, without using the strengths of the Bitcoin blockchain in verification of transactions and in anchoring ratings to specific transactions. The strengths of the blockchain are in its public nature and in the strong cryptographic proof that its contents are valid. These strengths should also make a strong rating system. A coin-based system is most directly designed to capitalize on these strengths. One potential area of future research would be in solving the problems of multi-blockchain synchronization. Another is in designing transactions that coordinate the potential monetary value of colored coins, Namecoins and others, with entirely different uses such as transaction ratings. The question of anonymity is one that none of the technologies considered is well able to handle. A web-based system is in the best position of any of the three to impose standards on sellers but may find enforcement extremely difficult. Transactions taking place outside the system, even if still with Bitcoin, will be unknown to the system and difficult or impossible to trace back to the specific seller. A hybrid system, that combines two or all of the systems described in this paper is worthy of further investigation. Could a site based rating system interact with external wallets? Could a coin-based system be designed that would interact with both? At a higher level, what is the minimum level of adoption by sellers or buyers for a rating system to make it truly useful? Is this level higher, lower, or the same with wallet based systems or coin based systems than for web based systems? This question is especially interesting with a coin based system because of the peer-to-peer nature of the Bitcoin protocol. Bitcoin is dependent on pure computing power to guaranty the integrity of its blockchain. Bad actors that may attempt to spend coins they do not possess or otherwise corrupt transactions are frustrated by the enormous computational capacity of the more honest part of the network. Altcoins, including a hypothetical transaction rating coin, will almost certainly have smaller networks behind them and so may be less stable. The problem might be somewhat mitigated, however, by the act of reading against the Bitcoin blockchain. A better understanding of these factors would be helpful in building new features and services for the Bitcoin ecosystem.

## **MICRO FINANCE: A CRUCIAL DRIVER FOR RURAL WOMEN EMPOWERMENT**

**Dr. Pandurang B. Patil**

*Associate Professor & Head, Department of Economics, Toshniwal Arts, Commerce & Science College, Sengaon, Dist. Hingoli.*

### **Introduction:**

Micro finance is not just a tool for poverty eradication but also for individual development, growth in entrepreneurial activities in the economically backward areas. Over the last few years the micro finance services have been changing people's lives and revitalizing communities. According to the estimates of RBI, there are over 450 million "unbanked" rural areas. India consists over a quarter of its population below to poverty line. They are mainly depending upon the informal providers of finance, such as the village moneylender. It is undisputed that access to finance is critical for enabling individuals and communities to climb out of poverty. Village money lenders are exploiting the rural poor by charging high interest rate and utilising them for different works. In early 1970s of Indian subcontinent, mainly in India and Bangladesh, Micro finance came into existence by the initiatives of micro finance pioneer a Muhammad Yunus of Bangladesh. Micro finance in India came into strength a with the formation of Shri Mahila "SEWA" Sahkari Bank, (Self Employed Women's Association) in the state of Gujrat with the motive of providing financial help to poor women employed in the unorganized sector in Ahmadabad. This research paper is an effort to bring light the role of micro finance in rural development through women empowerment. The micro finance service in India is amongst the largest in the world with 75 million poor households potentially requiring financial services.

### **Functioning of Micro Finance in India:**

There are two common approaches of Micro Finance in India –

#### **1. Self-help groups:**

The Self-help groups method (SHG) is an unofficial group of approximately 10-20 members. The members of the SHG are joined for the specific purpose of facilitating saving and credit services for its members. This is made possible through members pooling their resources to create a common fund. The process and social involvement of SHGs are intended to be instruments of empowerment, building the capacity of members to eventually conduct and manage SHGs for themselves, and enabling them to have greater autonomy in financial decision making as well as wider social participation. SHG meetings are set to take place at regular intervals and at a designated time. Group members are drawn from the same social economic layer and work on the basis of equal participation and contribution from all members. The groups are chaired by one lead member at a time; this role is usually rotated to allow capacity building for all members. Meetings are structured and accurate and up to date records of all financial transactions, group decisions and actions are compiled. Once established, SHGs are encouraged to make links with other SHGs and eventually with financial institutions to allow access to further financial assistance. The micro finance institutions in the rural credit sector have made the access to rural credit convenient through a particular subset of financial services which provide small loans to very poor families, most often without any collateral. The loan can be for consumption, production activities or for small business. This enables the rural people to raise their income level and living standards. Micro finance helps the rural people to avail and create economic growth opportunities. The access to credit as well as extending other financial products and services to these people of low income group below poverty line includes women, small and marginal families, artisans, agricultural labourers and share croppers. The facts reveal that interest rates charged by informal money lenders are hidden than those charged by micro finance

institutions, hence, there is an overwhelming demand from all corners to protect the rural people from these extorters and play a vital role by MFIs as vehicle to reach poor.

**2. Grameen Groups:** In this model, financial assistance is provided to the individual in a group by the formal institution on the strength of group's assurance. In other words, individual loans are provided on the strength of joint liability/co obligation. This micro finance model was initiated by Bangladesh Grameen Bank and is being used by some of the Micro Finance Institutions (MFIs) in our country.

**Present scenarios of Micro Finance:** Micro finance is emerging as a powerful instrument for poverty alleviation in the new economy. In India, Micro finance scene is dominated by SHGs Bank linkage programme as a cost effective mechanism for providing financial services to the unreached poor which has been successful not only in meeting financial needs of the rural poor women but also s SHG - Bank Linkage Programme has traversed twenty-five years of unabated journey towards empowering the rural poor, in general and rural women in particular. Taking a big leap from a pilot in 1992, SHG Bank Linkage Programme has now become the largest community based micro finance initiative with 85.77 lakh SHGs as on 31 March 2017 covering more than a hundred million rural households. There was a net addition of 6.73 lakh savings linked SHGs during 2016-17, a major portion (70.4%) from priority States indicating the urge for connecting the poor households in less developed States with the development process through SHG-BLP. During 2016-17, despite the impact of demonetisation on credit disbursement and repayments, combined efforts and initiatives of NABARD, banks, SHPIs, NRLM and Government agencies have given great boost to the SHG-BLP movement. There was a net addition of 6.73 lakh SHGs during the year increasing the number of SHGs having savings linkage to 85.76 lakh as on 31 March 2017. The savings outstanding of SHGs with banks as on 31 March 2017 has reached an all-time high of Rs.16114.22 crore. During the year, banks have disbursed loan of Rs.38781.16 crore, recording 4% increase over the last year despite the impact of demonetisation which slowed down loan disbursement post October 2017. The total bank loan outstanding to SHGs also increased by 7.81% and stood at Rs.61581.30 crore against Rs.57,119 crore as on 31 March 2016. The gross NPA of bank loans to SHGs marginally increased by about 5 basis points from 6.45% as on 31 March 2016 to 6.50% as on 31 March 2017. This was achieved in a year when there was overall deterioration in quality of assets and mounting NPAs in the banking sector.

**Micro Finance Institutions and Microfinance:** In India, the MFI sector has grown remarkably during past two decades, spreading across the country and surviving the 2010 Andhra Pradesh micro finance crisis. As on 31 March 2016, they reached out to 40 million clients with an outstanding credit of Rs.63,853 crore<sup>5</sup>. There was a steady growth in the average credit outstanding per client, by 76% from Rs.7481 in 2011 to Rs.13162 in 2015. Interestingly, in the recent past MFIs are growing fast in the states like Punjab, Haryana, Gujarat, Himachal Pradesh, and Uttar Pradesh, which are left uncovered by SHG-BLP. Though MFIs provided loans for both consumption and productive purposes, a major part of the credit flow, 94% in 2016, is channelized for income generating activities. MFIs played a significant role in bridging the gap between the formal financial institutions and the rural poor. However, of late, their increasing urban orientation and providing pure credit products without the capacity building component have been criticised, for the situation in rural areas is not of credit shortage alone. It is more of shortage of entrepreneurial capabilities and lack of technical skills.

**Approach about Women Empowerment:** Women in rural India lived in virtual isolation, unable to access even the most basic of services. But, with the formation of Women's Self-Help Groups, these women are now achieving social and physical mobility. It is recognized that while the empowerment of women is a process that will not happen automatically, SHG is a suitable means for the empowerment of women. The impacts of SHGs on socio-economic status of women were found significant. While financial intermediation and promoting savings among SHG women is seen as an entry point, the major

purpose is expected to be gender equality and empowerment. Ending all forms of discrimination against all women and girls everywhere, eliminating violence against women, ensuring full and effective participation and equal opportunities for leadership, etc., being targets under SDG for achieving gender equality and “empower all women” can be better fulfilled through the medium of SHGs. As several studies brought out, members of SHGs expressed better role in decision making at home and community, higher level of confidence in facing outside people and situations, ability to raise voice on violence against self and fellow members and ensuring children’s education compared to non-members. Studies have established that SHG movement has enabled the women to get the social identity and leadership in decision-making and take a stand on the issues related to family as well as society. SHGs have battled against social evils like dowry, sale of liquor in villages, exploitation against women, etc. They have also put forth their demands before the appropriate authorities for road connectivity to villages, electricity, health and sanitation facilities, provision of drinking water, etc. SHGs were also seen fighting for the rights of not only the members and their families but also women in general, common interests of the settlements, etc.

**Micro Finance and Women Empowerment:** Micro-finance programmes not only give women and men access to savings and credit, but reach millions of people worldwide bringing them together regularly in organised groups. Although no ‘magic bullet’, they are potentially a very significant contribution to gender equality and women's empowerment, as well as pro-poor development and civil society strengthening. Through their contribution to women’s ability to earn an income these programmes have potential to initiate a series of ‘virtuous spirals’ of economic empowerment, increased well-being for women and their families and wider social and political empowerment. A survey of 60 micro finance institutions by Cheston and Kuhn found strong evidence that micro finance institutions contribute to women’s empowerment. One consistent finding was increased self-confidence and increase self-esteem. Another was women’s increased participation in decision-making. Women’s Empowerment Project in Nepal, for example, showed 68% of women experienced an increase in their decision making role in the areas of family planning, children’s marriage, buying and selling property, and sending their children to school. World Education also found that the combination of education and credit put women in stronger position to ensure more equal access for female children to food, schooling and medical care. Other studies also showed increased ability to make purchasing choices, manage household funds, and manage enterprise funds. Women clients have also experienced improved status and gender relations in the home. Women’s financial contributions helped them earn greater respect from their husbands and childrens, negotiate husband’s help with housework, and avoid family quarrels over money. The study also found increased respect from and better relationship within extended family and in-laws. Several studies show that women received more respect from their communities than they did before joining a micro finance programme. They also show women taking greater roles in giving advice within the community, organizing for social change, and participating in community meeting – in part because they are now able to contribute financially to community need and activities such as funerals. A number of programmes also found increased political participation, including involvement in civic action and women clients being elected to office. There are also some negative impacts and limitations to empowerment. A number of studies show an increase in women’s workloads. As they expand their businesses and participate in micro finance meeting. Some women have reported ill health and exhaustion. However, the majority of women who experienced increased workloads were happy to make that choice and felt that the benefits outweighed the costs of participation.

**Suggestions:**

1. Emphasis should be given to SHGs formation and group lending rather than individual lending.

2. There is a need to have proper regulating authority at each level saving, depositing, lending of money, which will help in long term sustainability of the sector and in avoiding any misuse of money.
3. There is need to evolve new products by the banks commensurate with the requirements of women.
4. Strong marketing network is essential for effective and proper marketing of product and services of micro enterprises linked SHGs.
5. As women are an important part of the community, building their capability to manage communities and community project should be enhanced. Education is a good channel for women empowerment and poverty.
6. The members of all the self-help groups need to undergo training programmes related to accounting, motivation etc.

**Conclusion:** Thus it can be concluded from the above study that microfinance is playing a vital role in the social, psychological as well as economic empowerment of women in India. However women's contribution to increased income going into households does not ensure that women necessarily benefit or that there is any challenge to gender inequalities within the household. Women's expenditure patterns may replicate rather than counter gender inequalities and continue to disadvantage girls. Without substitute care for small children, the elderly and disabled, and provision of services to reduce domestic work many programs reported adverse effects of women's outside work on children and the elderly. Although in some contexts women may be seeking to increase their influence within joint decision-making processes rather than independent control over income neither of these outcomes can be assumed. Women's perceptions of value and self-worth are not necessarily translated into actual well-being benefits or change in gender relations in the household. Men are often very enthusiastic about women's credit programs. It is clear that gender strategies in micro finance need to look beyond just increasing women's access to savings and credit and organizing self-help groups to look strategically at how programmes can actively promote gender equality and women's empowerment.

## CLIMATE CHANGE AND AGRICULTURE

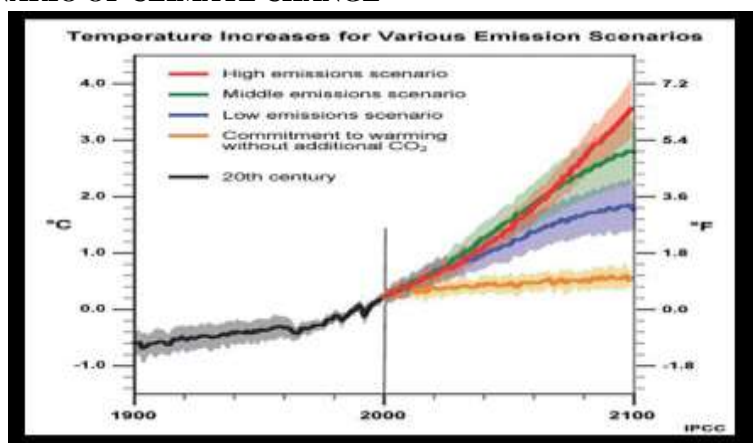

Prof. Anil N. Shinde

Dr. C. D. Deshmukh Comm. & Sau.K.G.Tamhane Arts College Roha.Dist- Raigad.

### INTRODUCTION:

Climate change is any significant long-term change in the expected patterns of average weather of region (or the whole Earth) over a significant period of time. It is about non-normal variations to the climate, and the effects of these variations on other parts of the Earth. These changes may take tens, hundreds or perhaps millions of year. But increased in anthropogenic activities such as industrialization, urbanization, deforestation, agriculture, change in land use pattern etc. leads to emission of green house gases due to which the rate of climate change is much faster. Climate change scenarios include higher temperatures, changes in precipitation, and higher atmospheric CO<sub>2</sub> concentrations. There are three ways in which the Greenhouse Effect may be important for agriculture. First, increased atmospheric CO<sub>2</sub> concentrations can have a direct effect on the growth rate of crop plants and weeds. Secondly, CO<sub>2</sub>-induced changes of climate may alter levels of temperature, rainfall and sunshine that can influence plant and animal productivity. Finally, rises in sea level may lead to loss of farmland by inundation and increasing salinity of groundwater in coastal areas.

### GLOBAL SCENARIO OF CLIMATE CHANGE

Projected scenarios of global warming indicate that the global average surface temperature could rise by 1.4 to 5.8°C by 2100. The projected rate of warming is unprecedented during last 10,000 years. All climate models indicate a rising trend in temperature. Precipitation pattern has changed with decreased rainfall over south and south-east Asia. More intense and longer droughts have occurred since 1970s. Perpetual snow cover has declined on both area and depth of snow cover. Global mean sea level is projected to rise by 0.18 to 0.59 m by the end of the century. Six of the 10 countries most vulnerable to climate change are in the Asia-Pacific. Bangladesh tops the list followed by India, Nepal, the Philippines, Afghanistan and Myanmar. In Bangladesh, for example, about one-fifth of the nation's population would be displaced as a result of the farmland loss estimated for a 1.5 m sea-level rise. The Maldives Islands in the Indian Ocean would have one-half of their land area inundated with a 2 m rise in sea level.

**CROP RESPONSES TO EXPECTED CLIMATE CHANGE FACTORS:** Climate change scenarios include higher temperatures, changes in precipitation, and higher atmospheric CO<sub>2</sub> concentrations which may affect on yield (both quality and quantity), growth rates, photosynthesis and transpiration rates, moisture availability, through changes of water use (irrigation) and agricultural inputs such as herbicides,

insecticides and fertilizers etc. Environmental effects such as frequency and intensity of soil drainage (leading to nitrogen leaching), soil erosion, land availability, reduction of crop diversity may also affect agricultural productivity. An atmosphere with higher CO<sub>2</sub> concentration would result in higher net photosynthetic rates (Cure & Acock 1986, Allen et al. 1987). Higher CO<sub>2</sub> concentrations may also reduce transpiration (i.e. water loss) as plants reduce their stomatal apertures, the small openings in the leaves through which CO<sub>2</sub> and water vapor are exchanged with the atmosphere. The reduction in transpiration could be 30% in some crop plants (Kimball 1983). However, stomatal response to CO<sub>2</sub> interacts with many environmental (temperature, light intensity) and plant factors (e.g. age, hormones) and, therefore, predicting the effect of elevated CO<sub>2</sub> on the responsiveness of stomata is still very difficult (Rosenzweig & Hillel 1995). For every 75 ppm increase in CO<sub>2</sub> concentration rice yields will increase by 0.5 t/ha, but yield will decrease by 0.6 t/ha for every 1 °C increase in temperature (Sheehy et al., 2005). CO<sub>2</sub> enrichment have generally shown significant increases in rice biomass (25-40%) and yields (15-39%) at ambient temperature, but those increases tended to be offset when temperature was increased along with rising CO<sub>2</sub> (Ziska et al., 1996a,b; Moya et al., 1998). Yield losses caused by concurrent increases in CO<sub>2</sub> and temperature are primarily caused by high-temperature-induced spikelet sterility (Matsui et al., 1997a). Increased CO<sub>2</sub> levels may also cause a direct inhibition of maintenance respiration at night temperatures higher than 21°C (Baker et al., 2000). In rice, extreme maximum temperature is of particular importance during 3 flowering which usually lasts two to three weeks. Exposure to high temperature for a few hours can greatly reduce pollen viability and, therefore, cause yield loss. Spikelet sterility is greatly increased at temperatures higher than 35 °C (Osada et al., 1973; Matsui et al., 1997b) and enhanced CO<sub>2</sub> levels may further aggravate this problem, possibly because of reduced transpirational cooling (Matsui et al., 1997a). A key mechanism of high temperature-induced floret sterility in rice is the decreased ability of the pollen grains to swell, resulting in poor thecae dehiscence (Matsui et al., 2000). Significant genotypic variation in high-temperature induced floret sterility exists. Variation in solar radiation, increased maintenance respiration losses or differential effects of night vs. day temperature on tillering, leaf-area expansion, stem elongation, grain filling, and crop phenology have been proposed as possible causes (Peng et al., 2004; Sheehy et al., 2005). In a recent climate chamber study, there was first evidence of possible genotypic variation in resistance to high night temperatures (Counce et al., 2005) High CO<sub>2</sub> levels and/or temperature are likely to affect crop development rates.

#### **Predicted effects of climate change on agriculture over the next 50 years**

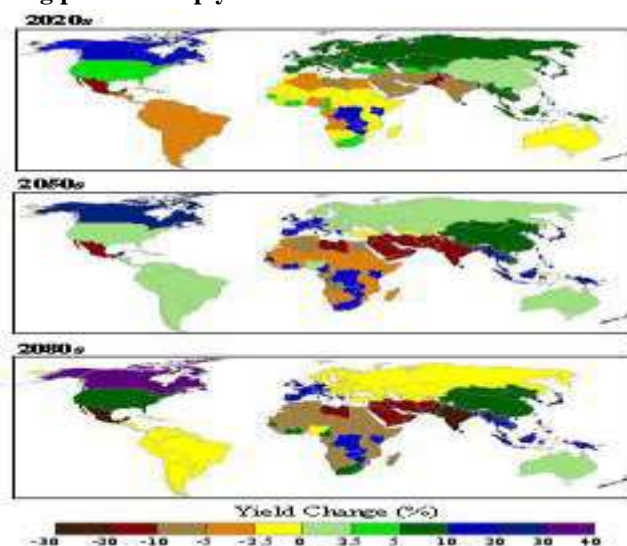

<b>Climatic element</b>	<b>Expected changes by 2050's</b>	<b>Confidence in prediction</b>	<b>Effects on agriculture</b>
CO <sub>2</sub>	Increase from 360 ppm to 450 - 600 ppm (2005 levels now at 379 ppm)	Very high	Good for crops: increased photosynthesis; reduced water use
Sea level rise	Rise by 10 -15 cm Increased in south and offset in north by natural subsistence/rebound	Very high	Loss of land, coastal erosion, flooding, salinisation of groundwater
Temperature	Rise by 1-2oC. Winters warming more than summers. Increased frequency of heat waves	High	Faster, shorter, earlier growing seasons, range moving north and to higher altitudes, heat stress risk, increased evapotranspiration
Precipitation	Seasonal changes by ± 10%	Low	Impacts on drought risk' soil workability, water logging irrigation supply, transpiration

Storminess	Increased wind speeds, especially in north. More intense rainfall events.	Very low	Lodging, soil erosion, reduced infiltration of rainfall
Variability	Increases across most climatic variables. Predictions uncertain	Very low	Changing risk of damaging events (heat waves, frost, droughts floods) which effect crops and timing of farm operations
Source: Climate change and Agriculture, MAFF.			

Warming will accelerate many microbial processes in the soil-floodwater system, with consequences for the C and N cycle. Crop residue decomposition patterns may change. Increased soil temperature may also lead to an increase in autotrophic CO<sub>2</sub> losses from the soil caused by root respiration, root exudates, and fine-root turnover. Climate change impacts will also impact on rice production through rising sea level rise. Most studies project decreased yields in non-irrigated wheat and in rice, and a loss in farm-level net revenue between 9% and 25% for a temperature increase of 2–3.5°C. Aggarwal and Mall (2002) observed that a 2 °C increase resulted in a 15–17% decrease in grain yield of rice and wheat. Fungal and bacterial pathogens are also likely to increase in severity in areas where precipitation increases. Under warmer and more humid conditions cereals would be more prone to outbreaks of pest and diseases thereby reducing yield.

**IMPACT OF CLIMATE CHANGE ON WORLD’S AGRICULTURE:** Climate change is likely to directly impact on food production across the globe. Increase in the mean seasonal temperature can reduce the duration of many crops and hence reduce final yield. In areas where temperatures are already close to the physiological maxima for crops, warming will impact yields more immediately (IPCC, 2007). World agriculture faces a serious decline within this century due to global warming. Overall, agricultural productivity for the entire world is projected to decline between 3 and 16 % by 2080. Developing countries, many of which have a average temperatures that are already near or above crop tolerance levels, are predicted to suffer an average 10 to 25% decline in agricultural productivity the 2080s. Rich countries, which have typically lower average temperatures, will experience a much milder or even positive average effect, ranging from a 8% increase in productivity to a 6% decline. Individual developing countries face even larger declines. India, for example, could see a drop of 30 to 40%.

**Results of models showing possible crop yields in the future**

The figure shows the results obtained using the Hadley climate model for the years 2020, 2050 and 2080 . The maps show that increased temperatures in many parts of Africa will reduce food production. The decrease in rainfall in Australia will reduce crop yields but this decline can be overcome by irrigation in some cases. The increase in rainfall combined with a moderate increase in temperatures in North America may benefit food production. The burden of climate change is likely to fall disproportionately on the poorer countries of the world. To interpret the maps we have to remember that the results obtained depend on climate, the effect of CO<sub>2</sub> levels on crop growth and changes in socioeconomic conditions. For example, in developed countries lower rainfall levels can be overcome through irrigation but these technological solutions are not necessarily possible in less developed countries.

#### **CLIMATE CHANGE – MITIGATION AND ADAPTATION IN AGRICULTURE**

**Mitigation-** Regardless of the projected or actual impacts of climate change, agriculture is also likely to be directly or indirectly involved in climate change mitigation efforts. Greenhouse gas emissions (GHGE) constitute a global production externality which is likely to adversely affect climate. The UNFCCC is trying to negotiate net GHGE emission reductions. Actions under that convention yielded the Kyoto Protocol which represents the first significant international agreement towards GHGE reduction. Agriculture (using a definition including forestry) is mentioned as both an emitter and a sink in the protocol. Annex A lists agriculture as an emission sources from enteric fermentation, manure management, rice cultivation, soil management, field burning, and deforestation. The protocol also lists agriculturally related sinks of afforestation and reforestation. Additional sources and sinks are under consideration including agricultural soil carbon

**Adaptation** - The consequences of climate change-induced agricultural productivity impacts will be, in great part, determined by human adaptations. Societies have adapted agriculture to a wide variety of climates around the world and the predicted rise in temperatures is less than the variability exhibited between regional climates. Thus adaptations to climate changes of the size forecast are already in existence in other parts of the world. Farm level cropping adaptations can be made in planting and harvest dates, crop rotations, crop mix, crop varieties, irrigation, fertilization, and tillage practices. Livestock producers can adapt to climate change by the provision of shading, sprinklers, improved air flow, lessened crowding, altered diets, and more care in handling animals. Herds or the locus of livestock production may also be moved to more hospitable locations. In the longer term, new crop varieties and livestock breeds may be developed that perform better under the anticipated future climate regime. Given these options, the IPCC (1996) report concluded that intensively managed livestock systems are potentially more adaptable to climate change than crop systems, particularly because they are better able to adapt to extreme events. Overall, adaptation can lessen the yield losses that might result from climate change, or improve yields where climate change is beneficial

**CONCLUSION:** Global Warming has now started showing its impacts worldwide. Climate is the primary determinant of agricultural productivity which directly impacts food production across the globe. The agriculture sector is the most sensitive sector to climate changes because the climate of a region/country determines the nature and characteristics of vegetation and crops. Increase in the mean seasonal temperature can reduce the duration of many crops and hence reduce final yield. Food production systems are extremely sensitive to climate changes like changes in temperature and precipitation, which may lead to outbreaks of pests and diseases thereby reducing harvest ultimately affecting the food security of the country. The net impact of food security will depend on the exposure to global environmental change and the capacity to cope with and recover from global environmental change. Coping with the impact of climate change on agriculture will require careful management of resources like soil, water and biodiversity. To cope with the impact of climate change on agriculture and food production, India will need to act at the global, regional, national and local level.

## **CURRENT FOREIGN TRADE POLICY OF INDIA**

**Dr. R. G. Rasal**

*Head Dept. of Economics, Vice Principal, Padmashri Vikhe Patil College of Arts, Science and Commerce, Pravaranagar, Tal-Rahata, Dist-Ahmednagar, Maharashtra, (India)*

**Introduction:** Foreign Trade Policy (FTP) is the set of guidelines or the procedures which are being formulated by the government to incorporate in the economy and being followed so as to attain maximum amount of Foreign Trade. Due to uneven distribution of natural resources and the theory of comparative cost, some countries are more suitable place to produce some goods more economically than other countries which encourages foreign trade. Policies enacted by the government sector of a domestic economy to discourage imports from, and encourage exports to, the foreign sector. The three most common foreign trade policies are tariffs, import quotas, and export subsidies. Tariffs and import quotas are designed to discourage imports and export subsidies are designed to encourage exports. The general goal of these foreign trade policies is to create or increase a country's balance of trade surplus, that is, to increase net exports. By increasing net exports (and creating a more "favorable" balance of trade), the domestic production of a nation increases, which then increases domestic income and employment. While foreign trade policies can be beneficial to the aggregate domestic economy they tend to be most beneficial, and thus most commonly promoted by, domestic firms facing competition from foreign imports. Domestic firms benefit with higher sales, greater profits, and more income to resource owners. However, by increasing domestic prices and restricting accessing to imports, foreign trade policies also tend to be harmful to domestic consumers.

**The Meaning of Foreign Trade:** Foreign trade is exchange of capital, goods, and services across international borders or territories. In most countries, it represents a significant share of gross domestic product (GDP). While international trade has been present throughout much of history, its economic, social, and political importance has been on the rise in recent centuries. All countries need goods and services to satisfy wants of their people. Production of goods and services requires resources. Every country has only limited resources. No country can produce all the goods and services that it requires. It has to buy from other countries what it cannot produce or can produce less than its requirements. Prior to the 1991 economic liberalization, India was a closed economy due to the average tariffs exceeding 200 percent and the extensive quantitative restrictions on imports. Foreign investment was strictly restricted to only allow Indian ownership of businesses. Since the liberalization, India's economy has improved mainly due to increased foreign trade

**Foreign Trade Policy 2015-20:** FTP2015-20, introduces two new schemes, namely "Merchandise Exports from India Scheme (MEIS)" for export of specified goods to specified markets and "Services Exports from India Scheme (SEIS)" for increasing exports of notified services, in place of a plethora of schemes earlier, with different conditions for eligibility and usage. There would be no conditionality attached to any scrips issued under these schemes. Duty credit scrips issued under MEIS and SEIS and the goods imported against these scrips are fully transferable. For grant of rewards under MEIS, the countries have been categorized into 3 Groups, whereas the rates of rewards under MEIS range from 2% to 5%. Under SEIS the selected Services would be rewarded at the rates of 3% and 5%. Measures have been adopted to nudge procurement of capital goods from indigenous manufacturers under the EPCG scheme by reducing specific export obligation to 75% of the normal export obligation. This will promote the domestic capital goods manufacturing industry. Such flexibilities will help exporters to develop their productive capacities for both local and global consumption. Measures have been taken to give a boost to

exports of defense and hi-tech items. At the same time e-Commerce exports of handloom products, books/periodicals, leather footwear, toys and customized fashion garments through courier or foreign post office would also be able to get benefit of MEIS (for values upto 25,000 INR). These measures would not only capitalize on India's strength in these areas and increase exports but also provide employment. Commerce Minister stated that although exports from SEZs had seen phenomenal growth, significantly higher than the overall export growth of the country, in recent times they had been facing several challenges. In order to give a boost to exports from SEZs, government has now decided to extend benefits of both the reward schemes (MEIS and SEIS) to units located in SEZs. It is hoped that this measure will give a new impetus to development and growth of SEZs in the country. Trade facilitation and enhancing the ease of doing business are the other major focus areas in this new FTP. One of the major objective of new FTP is to move towards paperless working in 24x7 environment. Recently, the government has reduced the number of mandatory documents required for exports and imports to three, which is comparable with international benchmarks. Now, a facility has been created to upload documents in exporter/importer profile and the exporters will not be required to submit documents repeatedly. Attention has also been paid to simplify various 'Aayat Niryat' Forms, bringing in clarity in different provisions, removing ambiguities and enhancing electronic governance. Manufacturers, who are also status holders, will now be enabled to self certify their manufactured goods in phases, as originating from India with a view to qualifying for preferential treatment under various forms of bilateral and regional trade agreements. This "Approved Exporter System" will help these manufacturer exporters considerably in getting fast access to international markets. A number of steps have been taken for encouraging manufacturing and exports under 100% EOU/EHTP/STPI/BTP Schemes. The steps include a fast track clearance facility for these units, permitting them to share infrastructure facilities, permitting inter unit transfer of goods and services, permitting them to set up warehouses near the port of export and to use duty free equipment for training purposes. Considering the strategic significance of small and medium scale enterprise in the manufacturing sector and in employment generation, 'MSME clusters' 108 have been identified for focused interventions to boost exports. Accordingly, 'Niryat Bandhu Scheme' has been galvanized and repositioned to achieve the objectives of 'Skill India'. Outreach activities will be organized in a structured way at these clusters with the help of EPCs and other willing "Industry Partners" and "Knowledge Partners".

#### **Objectives of Foreign Trade Policy (2015-20)**

Goals and objectives are specified in para 43 of the "Vision, Mission & Objectives" in the executive summary. It states the following: The FTP for 2015-20 seeks to achieve the following:-

- 1) To provide a stable and sustainable policy environment for foreign trade in merchandise and services;
- ii) To link rules, procedures and incentives for exports and imports with other initiatives such as "Make in India", Digital India and Skill India to create an 'Export Promotion Mission' for India;
- iii) To promote the diversification of India's export by helping various sectors of the Indian economy to gain global competitiveness with a view to promote exports;
- iv) To create an architecture for India's global trade engagement with a view to expanding its markets and better integrating with major regions, thereby increasing the demand for India's product and contributing to the government's flagship "Make in India" initiative;
- v) To provide a mechanism for regular appraisal in order to rationalise imports and reduce the trade imbalance.

#### **Highlights of Foreign Trade Policy 2015-20:**

The Foreign Trade Policy (FTP) 2015-20 was unveiled by Ms Nirmala Sitharaman, Minister of State for Commerce & Industry (Independent Charge), Government of India on April 1, 2015. Following are the highlights of the FTP:

- I. FTP 2015-20 provides a framework for increasing exports of goods and services as well as generation of employment and increasing value addition in the country, in line with the 'Make in India' programme.
- II. The Policy aims to enable India to respond to the challenges of the external environment, keeping in step with a rapidly evolving international trading architecture and make trade a major contributor to the country's economic growth and development.
- III. FTP 2015-20 introduces two new schemes, namely 'Merchandise Exports from India Scheme (MEIS)' for export of specified goods to specified markets and 'Services Exports from India Scheme (SEIS)' for increasing exports of notified services.
- IV. Duty credit scrips issued under MEIS and SEIS and the goods imported against these scrips are fully transferable.
- V. For grant of rewards under MEIS, the countries have been categorized into 3 Groups, whereas the rates of rewards under MEIS range from 2 per cent to 5 per cent. Under SEIS the selected Services would be rewarded at the rates of 3 per cent and 5 per cent.
- VI. Measures have been adopted to nudge procurement of capital goods from indigenous manufacturers under the EPCG scheme by reducing specific export obligation to 75 per cent of the normal export obligation.
- VII. Measures have been taken to give a boost to exports of defense and hi-tech items.
- VIII. E-Commerce exports of handloom products, books/periodicals, leather footwear, toys and customised fashion garments through courier or foreign post office would also be able to get benefit of MEIS (for values up to INR 25,000).
- IX. Manufacturers, who are also status holders, will now be able to self-certify their manufactured goods in phases, as originating from India with a view to qualifying for preferential treatment under various forms of bilateral and regional trade agreements. This 'Approved Exporter System' will help manufacturer exporters considerably in getting fast access to international markets.
- X. A number of steps have been taken for encouraging manufacturing and exports under 100 per cent EOU/EHTP/STPI/BTP Schemes. The steps include a fast track clearance facility for these units, permitting them to share infrastructure facilities, permitting inter unit transfer of goods and services, permitting them to set up warehouses near the port of export and to use duty free equipment for training purposes.
- XI. 108 MSME clusters have been identified for focused interventions to boost exports. Accordingly, 'Niryat Bandhu Scheme' has been galvanised and repositioned to achieve the objectives of 'Skill India'.
- XII. Trade facilitation and enhancing the ease of doing business are the other major focus areas in this new FTP. One of the major objective of new FTP is to move towards paperless working in 24x7 environment.

#### **Foreign Trade Policy 2015 – 2020: A step towards the “Make in India” initiative**

The Foreign Trade Policy (FTP) 2015 – 2020 released by the Ministry of Industry and Commerce seeks to provide a stable and sustainable policy environment for export of goods and services. The Policy has been formulated to promote 'Make In India' and 'Digital India' initiative of the Government of India.

The Policy revamped various export incentives available for export of goods and services under Chapter 3 of FTP and merged various schemes mainly into two schemes i.e. Service Exports from India Scheme and Merchandise Export from India Scheme.

#### **Service Exports from India Scheme (SEIS)**

- I. The existing Served from India Scheme (SFIS) has been replaced with a new scheme called "Service Exports from India Scheme".

- II. In order to avoid confusion, the Policy states that all service providers will be eligible for benefit under SEIS scheme; irrespective of the fact whether the service is provided under an Indian brand or an overseas brand.
- III. The amount received in Indian Rupees for export of specified services will be deemed to be received in free foreign exchange and will be eligible for the benefits under SEIS scheme. This puts an end to the conflicting views taken by the authorities in cases where the export proceeds are received Indian Rupees.
- IV. The duty credit scrip and goods imported under SEIS scheme will be freely transferable and there will be no restriction on the nature of goods that can be imported under the scheme, other than the prohibited goods.
- V. The significant benefit to service industry is that: SEIS scrip can be used for payment of customs duty, excise duty and service tax. Furthermore, service tax and excise duty (including CVD) paid through SEIS scrip will also be eligible as CENVAT Credit to service provider. Thus, the service industry will now enjoy the tangible benefit under SEIS scheme, as opposed to the SFIS scheme, under which the benefit were only theoretical available to service industry.
- VI. On the flip side, the entitlement under this scheme has been reduced from existing 10% to 3% - 5% of Net Foreign Exchange earned (NFE), which may negatively impact the bottom line of service industry especially capital intensive service sector (i.e. port/ infrastructure etc.).
- VII. Earlier service provider providing services from its office located outside India was eligible for benefit under the SFIS scheme; however, such benefits now specifically stand withdrawn under the new regime.

#### **Merchandise Export from India Scheme (MEIS).**

For Merchandise exports, earlier there were five different schemes where there were different conditions attached to these schemes. Now there shall be a single scheme, namely Merchandise Export from India Scheme. The benefit under the MEIS shall however vary based on products, destination of goods etc. Under the existing EPCG Scheme, if import of goods is substituted by local procurement of goods, the export obligation would be reduced by 10%. In the revised policy, this benefit of reduction in export obligation has been increased from 10% to 25%. The Policy provides much needed clarity about the export incentive schemes and thereby reducing the potential litigations. On the other side, the new policy will have significant impact on the capital intensive export of services (e.g. port, infrastructure etc.) as their fiscal incentive will be reduced by fifty percent which may eventually push up the project cost.

**Conclusion:** Foreign trade in India has been one of the most important determinants of economic development in India. A new Foreign Trade Policy gives a boost to make in India vision of the government. The focus of the policy is on building the India Brand and increasing share of Export Market of India, Exports infrastructure. It emphasized on „Make in India, Skill India, and Ease of Doing Business“ and also provides the mechanism of review. It affirms consistent policy mechanism for five years with the review mechanism after two and half years. It aims at improving India’s exports by providing ample working space to the exporters, through easing norms, doing away with redundant policies and reducing red tapism. The unveiling of trade facilitation measures, simplified procedures, reduced interface between the authorities and industry shall motivate the exporter to do the business with more vigor, in a more transparent environment. The new policy also encourages exploration of new markets and product diversification and is designed to complement the long term vision of the government of prioritizing the importance of trade for growth of Indian economy. The foreign trade policy pitches for increasing exports by connecting it to the objectives and vision of the Make-in-India initiative.

## **FACTORS AFFECTING CUSTOMER LOYALTY IN INSURANCE COMPANIES OF NEPAL**

**Sadikshya Pandey**

**Introduction:** Customer loyalty is a fundamental goal of marketing as the purpose of marketing is to satisfy customers. Customer loyalty encourages consumers to shop more consistently, spend a greater share of wallet, and feel positive about a shopping experience, helping attract consumers to familiar brands in the face of a competitive environment (Al Sawalqa, 2012). According to Anderson and Sullivan (1993), responsiveness determines the promptness of the organization in meeting the requests of the customers. The study found that responsiveness also involves understanding needs and wants of the customers, convenient operating hours, individuals attention given by the staff, attention to problems and customers safety in their transaction (Kumar et al., 2009). Reliability also consists of accurate order fulfillment; accurate record; accurate quote; accurate in billing; accurate calculation of commissions, keep services promise. Reliability depends on handling customers' services problems; performing services right the first time; provide services at the promised time and maintaining error-free record. Furthermore, the study stated reliability as the most important factor in conventional service (Parasuraman and Grewal, 2000). There is an observable worldwide shift toward loyalty marketing in most of the sectors across various industries. The earlier business goal of ensuring customer satisfaction has got undermined due to prevailing colossal relationship orientation of businesses that calls for going beyond the boundaries of satisfaction and create a commitment based enduring association with customers that renders immunity to the business against competitive pressures (Oliver, 1980). Guillen et al. (2008) noted that the number of empirical studies on customer loyalty in the insurance sector is low. The study contended that it is important to monitor customer loyalty and business risk for the life insurance companies due to reasons such as access to information related to the quality of portfolio, effective handling of customer recruitment and retention strategies, evaluation of market's competitiveness in the insurance sector and company's position in that market. According to Dick and Basu (1994), customer loyalty has been defined as the strength of the relationship between the individual's relative attitude and repeat patronage. It is an important part of marketing side for the expansion of customer loyalty which focuses on the marketing strategy due to the benefits related with retaining the existing customers. Discovering an exact measurement of loyalty is very important due to its profitability (Rigby et al., 2003). Davies et al. (1995) revealed that concept of customer loyalty is new to those companies which have given more preference to price and availability of products for earning profit. Therefore, there must be clarity as to what customer satisfaction really means. Thus, customer satisfaction represents the state of mind of in which the customer finds themselves in after using products and services offered by the company as compared to their pre-purchase standard and expectation. Shemwell et al. (1998) found that loyalty became a popular topic in marketing during the 1980s and is a debated topic during both business expansion and recessions. Most discussion on customer loyalty involves customer expectation of the service delivery, actual delivery of the customer experience, and expectations that are either exceeded or unmet. If expectations are exceeded, positive disconfirmation results, while a negative disconfirmation results when customer experience is poorer than expected. According to Andreassen et al. (2003), a brand conveys to identify the name or fame that are used to represent a specific set of unique features, benefits and services to the buyers. Where an organization fails to develop a brand name as a major part of marketing its goods and services it fails to attract customer loyalty. Today, intensified competition in the areas of production and services around the world has increased compared to the past, retain customers and increase loyalty has become more difficult and demands they can help increase customer loyalty. According to Boshoff and

Gray (2004), service quality provides lasting competitive advantage to an organization and also helps to distinguish the organization from the competitors. Thus, service quality not only serves as an ingredient for creating customer loyalty but also helps to create product differentiation. The rapid change in technology has changed customer perception of service quality. On top of that, the increase in the number of service providers has made customer loyalty not an option but an essential part of the organizations' strategic planning. Aydin and Özer (2005) found that the switching cost factor directly affects loyalty and has a moderator effect on both consumer satisfaction and trust. Therefore, it plays a crucial role in winning customer loyalty. Spreng and Mackoy (1996) found that service quality is an important indicator of customer satisfaction. Service quality is a subjective phenomenon which varies from one individual to another. According to Huber et al. (2001), to maintain loyal customers for the companies and develop the competitive position in the market is seen as a strategic challenge.

Loyalty is often regarded as the consequence of marketing activity performed by an organization so it has acquired a central position in marketing. Customer loyalty leads to change in attitude of customers, repeat purchase and ultimately brand loyalty. Origin of the concept of customer loyalty is derived from the marketing concept that profit is generated through satisfaction of customer needs and wants (Sabir et al., 2014). Guillen et al. (2008) found that the number of empirical studies on customer loyalty in the insurance sector is low. They study that it is important to monitor customer loyalty and business risk for the life insurance companies due to reasons such as access to information related to the quality of portfolio, effective handling of customer recruitment and retention strategies, evaluation of market's competitiveness in the insurance sector and company's position in that market (Lysonski and Durvasula, 2008).

Bank as a service sector has a great influence in the economy of the country. The growth rate of economy largely depends on the rate of investment which, in fact depends on the level of saving. Higher saving leads to higher level of capital formation which is crucial for economic growth and development. The primary function of commercial bank is to accept deposit and provide loans. The commercial banks play major role in mobilizing saving for capital formation. The role of commercial banks in economic development includes saving promotion, saving mobilization, promotion trade, industry and employment allocation of funds, and transfer of money (Mishkin, 2011). Consumers recognize brand by building favorable attitude towards the brand and through the purchase decision process. Brand preference is understood as a measure of brand loyalty in which a consumer exercises his/her decision to choose a particular brand in presence of competing brand (Rajagopal and Pao, 2010). Studies on customer satisfaction established that there is a close relationship between the brand image and brand attributes. This relationship in turn influences the consumer's response towards brand loyalty (Silva & Alwi, 2006). Electronic commerce is considered as a way to reduce entry barriers and provides an excellent opportunity for customers to see and select the proper supplier (seller). Most of old trade organizations did not consider to the new customer service techniques new and therefore lost their own existing customers. Moreover, organizations should not assume that customer loyalty management is equal to customer management for profitability. Loyal customers are considered as great marketers and valuable source for selling (Maghsoudi, 2003). In the context of Nepal, Pandey (2015) revealed positive correlation between job satisfactions, employee's fairness perception with organizational commitment. Biswakarma and Khanal (2015) found the positive relationship between service quality with customer satisfaction and customer loyalty in commercial banks of Nepal. The above discussion reveals that there is no consistency in the findings of various studies concerning factors affecting customer loyalty in insurance company. Therefore, this study has been conducted to analyze the factors affecting customer loyalty in insurance companies. More specifically, it examines the impact of responsiveness, tangibility, reliability and assurance on customer loyalty in insurance companies of Nepal. The remainder of this

study is organized as follows: Section two describes the sample, data and methodology. Section three presents the empirical results and the final section draws conclusions and discusses the implications of the study findings.

**2. Methodological aspects:** This study is based on primary data which were gathered from the 102 respondents which mainly deals with the factors affecting customer loyalty in Nepalese insurance companies.

**The Model:** As a first approximation, this study assumes that customer loyalty depends on several dimensions (responsiveness, tangibility, reliability and assurance). Therefore, the regression model used in this study takes the following form:

$$CL = \beta_0 + \beta_1R + \beta_2T + \beta_3A + \beta_4Re + e_t, \dots \dots (i)$$

**Where,**

CL = Customer loyalty, R = responsiveness, T = tangibility, E = empathy, A = assurance and Re = Reliability. Where,  $e_t$  = the error term,  $e$  = error term and  $\beta_1, \beta_2, \beta_3, \beta_4$  are the beta coefficient of the explanatory variables to be estimated.

**Responsiveness:** Responsiveness defined as the willingness or readiness of employees to provide service. It involves timeliness of services (Parasuraman et al., 1985). According to Anderson and Sullivan (1993), responsiveness determines the promptness of the organization in meeting the requests of the customers. Shamsuddoha and Alamgir (2003) observed positive and significant impact of responsiveness on customer loyalty. Based on it, this study develops following hypothesis:

*H1: There is positive relationship between responsiveness and customer loyalty.*

**Tangibility:** Tangibility is regarded as the physical attributes of an organization that immediately influences the perception and expectation of the customers (Bitner, 1990). According to Chase (1978), tangibility has positive impact on customer loyalty. Similarly, Parasuraman et al. (1985) revealed that there is positive relationship between tangibility and customer loyalty. Based on it, this study develops following hypothesis:

*H2: There is positive relationship between tangibility and customer loyalty.*

**Reliability:** Reliability depends on handling customers' services problems; performing services right the first time; provide services at the promised time and maintaining error-free record. Douglas and Connor (2003) found positive influence of reliability on the customer loyalty. According to Parasuraman and Grewal (2000), there is positive relationship between reliability and customer loyalty. Based on it, this study develops following hypothesis:

*H3: There is positive relationship between reliability and customer loyalty.*

**Assurance:** Assurance is defined as knowledge and courtesy of employees and their ability to inspire trust and confidence. According to Sadek et al. (2010), in British banks assurance means the polite and friendly staff, provision of financial advice, interior comfort, eases of access to account information and knowledgeable and experienced management team. Likewise, Parasuraman et al. (1985) revealed that there is positive relationship between assurance and customer loyalty. Based on it, this study develops following hypothesis:

*H4: There is positive relationship between assurance and customer loyalty.*

### 3. Results and discussion

#### Correlation analysis

The Pearson correlation coefficients of factor affecting customer loyalty in insurance companies are presented in Table 1.

**Table 1: Pearson's Correlation matrix**

This table reveals the Pearson's correlation coefficients between dependent and independent variables. Customer loyalty (CL) is the dependent variable and responsiveness (R), tangibility (T), reliability (Re), and assurance (A) are the independent variables

Variables	Mean	St. dev.	R	T	Re	A	CL
R	1.91	0.32	1				
T	2.01	0.39	0.37**	1			
Re	2.06	0.37	0.39**	0.56**	1		
A	1.97	0.38	0.43**	0.55**	0.59**	1	
CL	1.97	0.38	0.32**	0.59**	0.49**	0.50**	1

Note: The asterisk signs (\*\*) and (\*) indicate that the results are significant at 1% and 5% levels respectively.

The table shows that the average value of responsiveness is 1.91. Likewise, the average value of tangibility is 2.01. Similarly, the average value of reliability, assurance and customer loyalty are 2.06, 1.97 and 1.97. The result shows that responsiveness is positively related to customers' loyalty. This means that increased in the responsiveness leads to increase in the customer loyalty. Similarly, tangibility is positively correlated to customers' loyalty. This indicates that increase in tangibility leads to increase in the level of customer loyalty. Likewise, the result shows that reliability is positively related to customer's loyalty. This indicates that betterment in the reliability to increase in the customer's loyalty. Likewise, the result shows that assurance is positively correlated to customer's loyalty. This means that betterment in the assurance leads to increase in the customer's loyalty.

#### Regression analysis:

Having indicated the Pearson correlation coefficients, regression analysis has been conducted and the results are presented in Table 2.

#### Table 2: Regression results of R, T, Re and A on customer loyalty

The result are based on pooled cross sectional data and customer loyalty of Nepalese insurance companies with 102 observations of 2017 survey using linear regression model. The model is  $CL = \beta_0 + \beta_1R + \beta_2T + \beta_3A + \beta_4Re + e$ , where, dependent variable is CL (customer loyalty) and independent variables are R (responsiveness), T (tangibility), Re (reliability) and A (assurance).

MODE L	INTERCEP T	Regression Coefficients of					Adj . R <sup>2</sup>	SEE	F
		R	T	Re	A	CL			
1	0.82 (4.218)**	0.60 (5.935)* *					0.2 5	0.33	35.21
2	0.54 (4.024)		0.70 (10.688)* *				0.5 2	0.26	114.24
3	0.61** (3.803)			0.65 (8.476)* *			0.4 1	0.29	71.841
4	0.50** (3.915)				0.74 (11.567)* *		0.5 6	0.25	133.79 0
5	0.35 (2.149)**	0.35 (2.149)*	0.19 (2.039)*			.623 (8.028)* *	0.5 4	0.25	61.003

6	0.29** (2.011)		0.51 (6.259)**	0.30 (3.579)* *		0.5 4	0.25	69.362
7	.339 (2.377)			0.23 (2.583)* *	0.58 (6.588)**	0.5 9	0.24	73.006
8	0.31 (2.019)	0.18 (2.028)*			0.66 (8.904)**	0.5 8	0.24	71.032
9	0.19 (1.694)	0.12 (1.376)	0.47 (5.451)**	0.28 (1.376)		0.5 8	0.24	47.294
10	0.23 (1.694)		0.31 (3.53)**	0.16 (1.827)	0.39 (3.818)**	.69 2	.2345 2	57.506

Note: The asterisk signs (\*\*) and (\*) indicate that the results are significant at 1% and 5% levels respectively.

Table 2 shows that the beta coefficient for responsiveness is positive and significant. It indicates that an increase in responsiveness leads to increase in customer loyalty. This finding is similar to the findings of Shamsuddoha and Alamgir (2003). Likewise, there is positive impact of tangibility on customer loyalty. It indicates that higher the tangibility, higher would be the customer loyalty. This finding is consistent with the findings of Bitner et al. (1990). Similarly, the beta coefficient is positive and significant for reliability. It indicates that higher the level of reliability, higher would be the customer loyalty. This finding is similar to the findings of Douglas and Connor (2003). Likewise, there is positive impact of assurance on customer loyalty. It indicates that higher the assurance, higher would be the customer loyalty. This finding is consistent with the findings of Sadek et al. (2010).

**4. Summary and conclusion:** Customer loyalty is a fundamental goal of marketing as the purpose of marketing is to satisfy customers. Customer loyalty is the result of successful marketing that creates competitive value for consumers. Contemporary marketing efforts are geared towards meeting consumers' needs and ensuring customer loyalty and strategizing on how to retain such customers (Hassan et al., 2008). Judgments of product performance are related to expectations that could enhance the customer satisfaction or brand loyalty (Awan & Rehman, 2014). This study attempts to determine the factors affecting customer loyalty in insurance companies of Nepal. This study is primarily based on primary sources of data collected from the 102 respondents. This study hypothesizes that the customer loyalty depends on several factors such as perceived responsiveness, tangibility, reliability and assurance. The study shows that responsiveness, tangibility, reliability and assurance are positively related to customer loyalty. It reveals that higher the responsiveness and tangibility, higher would be customer loyalty. This also indicates that higher the reliability and assurance, higher would be the customer loyalty. The regression analysis shows that responsiveness and tangibility of use have positive impact on customer loyalty. Similarly, reliability and assurance process also have positive impact on customer loyalty. This indicates that increase in the responsiveness and tangibility lead to increase in the customer loyalty. It also reveals that increase in the reliability and assurance process lead to increase in the customer loyalty.

## **E-COMMERCE BOOM IN INDIAN: ONLINE SHOPPING IS HERE TO STAY**

**Dr. Bharat M. Pithadia**

*Associate Professor, Dept. of Commerce, Nagindas Khandwala College, Mumbai*

**Introduction:** Firms across the globe have adopted e-commerce in their operations and have reaped benefits thereof. While firms in technologically developed countries like US and UK has deployed e-commerce to its advantage, whereas firms in developing countries like India failed to follow the suit. Though it has been widely acknowledged by the researchers that the adoption of e-commerce by businesses in developing countries is an important economic indicator of growth; many firms in India still have not realized the potential benefits of e-commerce. Further, e-commerce not only involves selling and buying online but it also involves a host of

activities spanning the firm's value chain like promotion of product/services on the web, integrating invoicing and payment from customers, secure transactions, and handling customer queries online. In short, e-commerce is an umbrella concept to integrate a wide range of existing and new applications

**Definition:** Devendra *et. al.*, (2012) defined that electronic commerce, commonly known as e-commerce or e-Commerce, consists of the buying and selling of products or services over electronic system such as internet and other computer network.

E-commerce can also be business defined as "new way of conducting supervision and executing business transactions using computer and telecommunication network".

### **Types of E-Commerce**

Waghmare G.T. (2012) has defined the following types of e-commerce:

- (i) B2B E-Commerce: Companies doing business with each other such as manufacturers selling to distributors and wholesalers selling to retailers. Pricing is based on quantity of order and is often negotiable.
- (ii) B2C E-Commerce: Businesses selling to the general public typically through catalogues utilizing shopping cart software. By dollar volume, B2B takes the prize, however B2C is really what the average Joe has in mind with regards to e-commerce as a whole. for example [indiatimes.com](http://indiatimes.com).
- (iii) C2C E-Commerce: There are many sites offering free classifieds, auctions, and forums where individuals can buy and sell thanks to online payment systems like PayPal where people can send and receive money online with ease. E-Bay's auction service is a great example of where customer-to-customer transaction takes place everyday.
- (iv) Others: G2G (Government-to-Government), G2E (Government-to-Employee), G2B (Government-to-Business), B2G (Business-to-Government).

### **Literature Review**

Torkzadeh and Dillon, (2002) found that customers were forced to rely on some limited information and pictures displayed on the sites. They also perceived difficulty in returning the purchased products and also in developing trust on the integrity of the sellers.

Banerjee, Dutta, and Dasgupta, (2010) identified factors that influence the attitude of Indian consumers towards online shopping. The authors found that the online security is one of the most important reasons that prevent the Indians consumers from shopping online. Buyers have no opportunity to physically examine the product.

Dawn and Kar, (2011) tried to find out the various issues in the e-tailing sector. By conducting a detailed survey of E-tailing organizations, they came up with an e-tailing strategy for effectiveness. The authors suggested that customers care is to be the top priority because online customers are educated and more aware. They further suggested that safety and security must be ensured for online transactions.

Devendraet. al., (2012) defined that electronic commerce, commonly known as e-commerce or eCommerce, consists of the buying and selling of products or services over electronic system such as internet and other computer network.

Rakesh and Khare (2012) indicated that online shopping seems to have more utilitarian benefits for men than to women. The study shows that the value consciousness, by providing deals, didn't have much influence on Indian online buyers. As per the authors instead of discount, the focus has to be shifted on safety concerns and quality aspects to attract customers to online shopping.

Bijalwan and Sirswal (2013) conducted a comparative study of online retailing and conventional retailing in India. As per the authors, the working capital requirement comes down to the sellers as many fixed overheads and variable overheads are eliminated automatically in the online retailing. The study also revealed that internet penetration has played role of catalyst in the development of online retailing.

Sahney, Ghosh and Shrivastava (2014) tried to explore what critical motivational factors influenced the decision of online buying. Example of online buying of railway tickets in India has been considered. Some of the findings of the study were: No gender difference were identified with respect to motivational factors for online buying. The young customers preferred online buying of tickets because of being tech savvy, middle aged customers preferred online buying to save their time while elderly customers were not comfortable with operating computers for booking tickets.

Raman (2014) identified convenience, reliability and risk as factors affecting female consumer behavior towards online shopping. Reliability and risk were found to be positively correlated. As the risks of shopping online increases, the lack of reliability also increase towards online shopping. The female shoppers preferred the established retail outlets to reduce the risks associated with online shopping.

Kanchan and Kumar (2015) found that, men indulged in more online shopping than women. People with higher education were more likely to do online shopping. Customers with past buying experience preferred online buying. Technology knowledge of customers had high impact on doing online buying.

Sunil (2015) tried to analyze the factors impacting customers to go for online shopping. The study found that customers who go in for online buying like, different payment forms; getting product information; less price; discounts; coupons & special sales; easy browsing and speed of selection of products.

#### **Objectives of Study**

1. To understand the concept of online shopping
2. To study the impact of online shopping.
3. To study the top motivating factors for shopping online.
4. To study the future of online shopping in India.

**Research Methodology:** The present study is based on the secondary data published by various agencies and organizations. The present study makes use of data and information provided by various websites, annual reports, IMAI and KPMG Report 2013, ASSOCHAM and, Media Reports, Press Releases, Department of Industrial Policy and Promotion (DIPP), research reports, consumer affairs.nic.in etc.

**Practical implications:** The study has implications for web-retailers, marketing managers, internet marketers, online vendors and web-shoppers in India. Indian online shoppers typically tend to seek offers and great value price deals instead of brand or quality. Online retailers may target the impulse purchase orientation nature of Indian consumers and should focus on increasing online trust.

**Online Shopping is here to stay:** The Internet has exploded in India, spreading its reach further than ever before. As more and more consumers embrace the virtual world as a safe and convenient place to shop – either on computers or using their smart phones – one thing is for certain, e-commerce is here to stay. The Indian Institute of E-Commerce states that by 2020, India is expected to generate \$100 billion online retail revenue out of which \$35 billion will be through fashion e-commerce. Online apparel sales are set to grow four times in coming years. Gadgets 360 CEO, Bhavna Agrawal says are plenty of reasons for this

monumental growth in e-commerce in India. “The Internet and mobile usage has increased tremendously over the last five years. Today, there are 100 million Internet users, a number which immediately creates an easy reach for all e-commerce sites. There is a very large base of active Internet shoppers, facilitated by the Cash on Delivery (CoD) service offered by e-tailers in the country.” She also adds that the rising disposable income in the largest class in India – the middle class – and an increase in the standard of living in Tier II cities has further aided the e-commerce boom in the country.

**Clicks Vs Bricks:** Bhavna Agarwal says that the growing popularity (and convenience) of e-commerce is affecting offline retail, mostly because retailers are transitioning to better pricing – which is more readily available online – and promotional strategies, which have a wider reach on the Internet. The online channel also provides customers the convenience of shopping anywhere in the world, as long as they are connected to the Internet. These are some of the main reasons that offline retail chains are entering the online segment. “As a country, we can accommodate good, healthy competition between online and offline. Online players should look at developing their physical presence mainly to enhance the customer experience. The idea is not to do this from the perspective of competition, but to take it to the next level – differentiating and innovating. If online retailers can improve and master their Omni-channel strategy and optimize their m-commerce experience, they will be in winning a position,” she says.

**The Future Belongs to Everyone:** Bhavna Agarwal feels that there something called the concept of unified commerce. “In 2017, we will see that there will be no such thing as online v/s offline experience. There will be a single touch-point, focusing on the consumer. Not just brands, but hyper local delivery networks will also evolve. Consumers will be able to order online and then pick up their package from an offline touch-point. These offline stores will actually be an extension of online businesses. And vice versa, traditional retailers will tie up with bigger, horizontal players to extend their brand reach – like Croma with Snapdeal and dozens of brands with Flipkart and Amazon,” she says. “People are not competing anymore – they are co-opting. Shoppers Stop is also in the process of revamping their entire platform. Everyone is understanding that online has a further reach and so it cannot be looked at as a competing channel,” she adds.

**Key E-Commerce Trends For 2017-18:** Indian e-commerce has such potential because it can bring three changes more profound than convenience and keen prices. The first is faster financial development. China already provides one example. Alipay, an arm of Alibaba, overcomes mistrust between buyers and sellers by holding on to customers’ money until they have safely received their goods. The torrent of information that Alibaba gathered on merchants and consumers was the basis for a lending business. Second, e-commerce firms could help overcome India’s ropy infrastructure and vast geography. About half of Flipkart’s and Snapdeal’s customers are outside India’s biggest cities. Some are still farther afield: Amazon claims to be helping more than 6,000 Indian businesses sell abroad. The third big impact of e-commerce in India is on retailing itself. Shopping malls and chain stores account for only about one-tenth of total retail sales. Already, the combined sales of India’s top three e-commerce sites, Flipkart, Snapdeal and Amazon, surpass those of the ten largest offline retailers. Two-thirds of Indians are below the age of 35. For these young people, armed with smart phones, shopping is likely to be very different from what it was for their parents. Malls and chains will not disappear, but they may never be as prevalent as they are in the West.

**Top Motivators for Shopping Online:** Times of India (February 12, 2013) has published that top motivators for shopping online which include cash back guarantee, cash on delivery, fast delivery, substantial discounts compared to retail, and access to branded products, while barriers include inability to touch and try products before purchase, fear of faulty products, apprehension of posting personal and financial details online and inability to bargain.

#### **Chart 2 Top Motivating Factors for Shopping Online**

Cash on delivert

Cash back guarentee

Fast delivery

Substantial discount

Access to branded product

**Conclusion:** The Internet has exploded in India, spreading its reach further than ever before. As more and more consumers embrace the virtual world as a safe and convenient place to shop – either on computers or using their smart-phones – **one thing is for certain, e-commerce is here to stay.** This paper deals with the conceptual knowledge of e-commerce, literature review, current and future aspects of e-commerce in Indian context. This paper discussed about the top motivator factors of shopping online. The present development would be a valuable addition to researcher, academicians, advertisers and entrepreneurs.

## **INDIA'S GROWING POPULATION: A CHALLENGE BEFORE INDIAN ECONOMY**

**Dr. N. S. Sabale**

*HoD, Dept. of Economics, S.N.Arts, D.J.M. Commerce & B.N.S. Science College, Sangamner  
Tal. Sangamner, Dist. Ahmednagar*

**Introduction:** The demographics of India are inclusive of the second most populous country in the world, with over 1.21 billion people (2011 census), more than a sixth of the world's population. Already containing 17.5% of the world's population, India is projected to be the world's most populous country by 2025, surpassing China, its population reaching 1.6 billion by 2050. Its population growth rate is 1.41%, ranking 102nd in the world in 2010. Indian population reached the billion mark in 2000. India has more than 50% of its population below the age of 25 and more than 65% below the age of 35. It is expected that, in 2020, the average age of an Indian will be 29 years, compared to 37 for China and 48 for Japan.

**Economy of India :** The Economy of India is the ninth largest in the world by nominal GDP and the fourth largest by purchasing power parity (PPP) The country is one of the G-20 major economies and a member of BRICS, and ASEAN. The country's per capita GDP (PPP) was \$3,408 (IMF, 129th in the world) in 2010, making it a low-income country. India recorded the highest growth rates in the mid-2000s, and is one of the fastest growing economies in the world. The growth was led primarily due to a huge increase in the size of the middle class consumer population, a large workforce comprising skilled and non-skilled workers, good educational standards and considerable foreign investments. India is the seventeenth largest exporter and the eleventh largest importer in the world.

### **Growing population challenges before Indian economy:**

**1. Population explosion:** According to the 2011 census of India, the population of India in 2011 was 1,210,193,422, growing at a rate of 17.6% in a decade approx. Such a vast population puts lots of stress on the economic infrastructure of the nation. Thus India has to control its growing population.

**2. Providing employment to growing population:** This is so because in the developing economies majority of the population is illiterate. The burden of school age population has already shown signs of becoming unbearable. The proportion of children in schools is increasing fast and, vast numbers are still not covered. The absolute number of illiterate persons increase every year. This is only an indication of the wastage of human resources for want of appropriate development opportunities. The increasing population is pressing hard on economic resources as well as job opportunities. The Indian government has started various schemes such as Jawahar Rozgar Yojna, and Self Employment Scheme for Educated Unemployed Youth (SEEUY). But these are proving to be a drop in an ocean.

**3. Problem of utilization of manpower:** Better educated manpower aspires for occupations of greater prestige, which are opened up by the new development efforts. Because of its capital intensive nature, the ability, of the new economy for employment generation becomes restricted. Simultaneously, it renders many of the oldest occupations out of the day. As a result, under-employment and unemployment, including unemployment of educated persons, increases. There is thus wastage of even developed human capital.

**4. Overstrained infrastructure:** Facilities such as housing, transportation, health care, and education become inadequate. The worst symptoms of congestion in every aspect of living conditions are manifested in the urban areas. In countries such as India, a situation of "over urbanization" prevails

which puts unbearable strain on urban amenities. Overcrowded housing, slums and unsanitary localities, traffic congestion and crowded hospitals have become common features in the developing countries.

**5. Pressure on land and other renewable natural resources:** Common properties such as forest and water are over-exploited. This results in deforestation and desertification in permanent damage to the renewable resources.

**6. Increased cost of production:** Human ingenuity and technological advancement make it possible to increase production of goods and services. But, it must be kept in mind that, the cost of production of the basic necessities of life, such as food, increases when the population is growing fast and worse lands are brought into cultivation with costly irrigation etc.

**7. Inequitable distribution of income:** Both at the international and national levels income disparities increase. The increase in gross national product (GNP) is greatly reduced in per capita terms on account of the rapidly growing population. In the face of a rapidly growing population, the major concern of a developing country tends to be focused more on economic growth as such. Considerations of unequal distribution of income are pushed to the background. So inequalities within the country tend to widen further.

**8. Poverty:** As per the records of National Planning Commission, 36% of the Indian population was living Below Poverty Line in 1993-94. Though this figure has decreased in recent times but some major steps are needed to be taken to eliminate poverty from India. These are challenges can be overcome by the sustained and planned economic reforms.

**Rural population and their development:** Over seventy per cent of India's population still lives in rural areas. There are substantial differences between the states in the proportion of rural and urban population, Such as varying from almost 90 percent in Assam and Bihar to 61 per cent in Maharashtra. Agriculture is the largest and one of the most important sectors of the rural economy and contributes both to economic growth and employment. Its contribution to the Gross Domestic Product has declined over the last five decades but agriculture still remains the source of livelihood for over 70 per cent of the country's population. A large proportion of the rural work force is small and consists of marginal farmers and landless agricultural labourers. There is substantial underemployment among these people; both wages and productivity are low. These in turn result in poverty; it is estimated that 320 million people are still living below the poverty line in rural India. Though poverty has declined over the last three decades, the number of rural poor has in fact increased due to the population growth. The poor tend to have larger families which put an enormous burden on their main resources, and prevent them from breaking out of the shackles of poverty. In States like Tamilnadu where the replacement level of fertility has been attained, population growth rates are much lower than in many other States; but the population density is high and so there is a pressure on land. In states like Rajasthan, Uttar Pradesh, Bihar and Madhya Pradesh population are growing rapidly, resulting in increasing pressure on land and may be result land fragmentation. Low productivity of small land holders leads to poverty, low energy intake and under nutrition, and this, in turn, prevents the development thus creating a vicious circle. In most of the state's non-farm employment in rural areas has not grown very much and cannot absorb the growing labour force. Those who are getting educated specially beyond the primary level may not wish to do manual agricultural work. They would like better opportunities and more remunerative employment. In this context, it is imperative that programmes for skill development, vocational training and technical education are taken up on a large scale in order to generate productive employment in rural areas. The entire complete range of existing poverty alleviation and employment generation programmes may have to be restructured to meet the newly emerging types of demand for employment. Rural poor have inadequate access to basic minimum services, because of poor connectivity, lack of awareness,

inadequate and poorly functional infrastructure. There are ongoing efforts to improve these, but with the growing aspirations of the younger, educated population these efforts may prove to be inadequate to meet the increasing needs both in terms of the type and quality of services. Greater education, awareness and better standard of living among the growing younger age group population would create the required consciousness among them that smaller families are desirable; if all the felt needs for health and family welfare services are fully met, it will be possible to enable them to attain their reproductive goals, achieve substantial decline in the family size and improve quality of life.

**Urbanization and Economic Growth:** Only 30 per cent of India's population lives in urban areas. This is much lower than in China, Indonesia, South Korea, Mexico, and Brazil. Some of this may be due to much lower per capita incomes in India. The Committee's projections suggest that India's urban population as presently defined will be close to 600 million by 2031, more than double that in 2001. Already the number of metropolitan cities with population of 1 million and above has increased from 35 in 2001 to 50 in 2011 and is expected to increase further to 87 by 2031. The expanding size of Indian cities will happen in many cases through a process of peripheral expansion, with smaller municipalities and large villages surrounding the core city becoming part of the large metropolitan area, placing increasing strain on the country's urban infrastructure. Future growth is likely to concentrate in and around 60 to 70 large cities having a population of one million or more. Decentralization of municipal governance and greater reliance on institutional financing and capital markets for resource mobilization are likely to increase the disparity between the larger and smaller urban centers. A satisfying outcome will depend on the formulation of effective public policies to accelerate all-round development of smaller urban centers and to refashion the role of the state as an effective facilitator to compensate for the deficiencies of market mechanisms in the delivery of public goods. Three decades of rapid economic growth would normally have propelled migration from rural areas but growth in India has not had this effect thus far. This is because industrialization has been capital intensive and the services boom fuelled by the knowledge economy has also been skill intensive. A few cities of India have acted as centers of knowledge and innovation. As more cities provide economies of agglomeration and scale for clusters of industries and other non-agricultural economic activity, the urban sector will become the principal engine for stimulating national economic growth. Industrialization will absorb more people as India advances further in its integration with the world economy. At the present juncture, India faces the challenge of continuing on its high growth trajectory while making growth more broad-based and labour-intensive.

**Summary:** Population, which is engaged in any economic activity (employed persons) and population seeking work (unemployed) constitute Labour Force. India has the second largest labour force in the world. Projection of labour force is pre-requisite ensuring optimal utilization of available human resources. Manpower development is then taken up to provide adequate labour force, of appropriate skills and quality to different sectors so that there is the rapid socioeconomic development and there is no mismatch between skills required and skills available. Planning also attempts to provide an enabling environment for employment generation (both self employment and wage employment) in public, private and voluntary sectors in urban and rural areas.

## **IMPACT OF DEMONETIZATION ON INDIAN ECONOMY**

**Dr Mundhe Fahim Ibrahim**

Assistant Professor and Head, Dept. of Economics, M.K.Degree College, Kalyan

**I) Introduction:** Demonetization is replacing a currency unit of its status as legal tender. Demonetization becomes necessary when there is a change of national currency. The old unit of currency replaced with a new unit of currency. It includes either introducing new notes or coins of the same denomination or completely replacing the old denomination with the new denomination. Currency which is issued by a government and circulated within the economy is used as a medium of exchange for goods and services; currency forms the basis for any trade. The currency or legal tender is issued by a country's central bank or a monetary authority. The national currency of a country is usually the main currency used for most of the financial transactions in that country. In most of the cases, the central bank of a country has the absolute right to issue money or the currency for circulation that affect the economy as a whole. Hence the objectives of this paper are:

### **II) Objectives:**

1. To study the effects of demonetization on economy in other countries
2. To identify the impact of demonetization adopted in 2016 on Indian economy

**III) History of Demonetizations in the World:** Many countries have tried demonetization to their economies. In Singapore, "Banana" notes by Japanese had been in circulation during their occupation and those notes were demonetized after their surrender in 1945, according to 'Singapore Mint'. In Fiji, the central bank announced that, "demonetization of the pounds and shillings was necessary as Fiji has transitioned to the new decimal currency structure from January 13, 1969 and due to limited quantities remaining in circulation, these notes and coins now have collectors" thus creating importance for the smaller value currency. Ghana moved out their demonetization decision with 50 cedi currency notes for monitoring money laundering and to prevent corruption. In the same way Nigeria's economy also collapsed after the demonetization move in 1984 as it doesn't have the way it was actually planned. The military President Muhammad Bukhara launched various colored notes to invalidate their old currency notes to fight black money. But the debt-ridden economy and high inflation hit Nigerian economy collapsed. In Myanmar, demonetization was carried out with larger denomination bank notes for many times in 1964, 1985, 1987, and 2015. In 90s, in Zaire, currency note reforms resulted in inflation surges and exchange rate against the dollar had collapsed. President Mikhail Gorbachev the then Soviet Union president in 1991 demonetized the higher denomination ruble bills, of 50s and 100s. Australia being the first country in 1996 had a full series of polymer currency notes to replace paper-based notes to stop counterfeiting. This currency made out of a more durable material changed all the currency in the country to a new type of currency note. Plastic currency was also released in 1992 and by 1996; all the currency notes produced were polymer in nature. Australia decided to replace its paper-based currency notes with polymer-based currency notes in 1996. In 2002 demonetization occurred when the euro was adapted by the member nations of the European Monetary Union to switch to the new currency euro, in which the authorities fixed various exchange rates for the national currencies of all its members into Euros. National currencies were demonetized before the Euro was introduced. However, the exchange of the old currencies to Euro continued to be convertible for a considerable period to enable a smooth transition after demonetization. Government of North Korea In 2010, under Kim Jong-II took two zeros off the face value of the country's currency in an attempt to constrict a control over the economy and to

bring an end to the black markets, but the country's poor harvest led to a severe food shortage. Demonetization results in a major economy breakdown leading to starvation of the people even for the basics of their life. Zimbabwean government demonetized the Zimbabwean dollar in 2015 to battle the country's rocketing inflation which was reported at 231,000,000%. It was a 3-month long process involving wipe out of the Zimbabwean dollar from the country's financial system and to strengthen the US dollar, Botswana pula, and South African rand as the country's legal tender in an attempt to stabilize the ruining economy. Zimbabwe used to have hundred trillion dollar note, which was later demonetized and was exchanged in a shocking way dropping trillion dollars to just \$0.5 dollar. Zimbabwe is a typical example, going through a phase of hyper-inflation in the year 2008 resulting in the value loss of its currency. The Reserve Bank of Zimbabwe announced having "adopted the multiple currency system or dollarization in the year 2009 and it became necessary to demonetize the Zimbabwe \$ unit to change that with the proposed multiple currency system. Zimbabwe's demonetization was considered to be critical for policy consistency and for enhancing the confidence of the consumers and businesses, according to its central bank. The central bank of the Philippines, in the year 2015 decided to demonetize the New Design Series currency notes which were issued on 12<sup>th</sup> June 1985, claiming to "align with the practice of other central banks around the world which change the design of their currency that has been in circulation for over 10 years." Government of Philippines demonetized its currency notes which prevailed valid for over 30 years with new currency being in circulation since 2010 to fight Counterfeiting. Pakistan has also announced to move all its old designed currency notes out of the economy. Pakistan had demonetized its 5 Rs and 500 Rs denomination notes earlier too. In European Union, creating the single currency (Euro) over the period 1998-2000 is considered to be the largest demonetization ever happened in the history.

**III) Demonetization in India:** In our country demonetization has happened thrice. The first was on the 12<sup>th</sup> of January 1946 (Saturday), second on 16<sup>th</sup> of January 1978 and the third was on 8<sup>th</sup> of November 2016 (Tuesday). In January 1946, notes of denominations 1,000 and 10,000 rupees were withdrawn from circulation and new notes of denominations 1,000, 5,000 and 10,000 rupees were introduced in 1954. During Janata Party coalition government, again demonetization taken place and banknotes of denominations 1,000, 5,000 and 10,000 rupees on 16<sup>th</sup> of January 1978 was withdrawn with the intention of curbing counterfeit currency and black money. The demonetization of denominations Rs. 500 and Rs. 1,000 notes was a policy decision carried out by the Government of India on 8<sup>th</sup> of November 2016. In the declaration, the use of denominations of all Rs. 500 and Rs. 1,000 notes of the Mahatma Gandhi Series would be invalid after the midnight of the same day, and was also announced that the new Rs. 500 and Rs. 2,000 notes of new series will be issued in exchange for the above mentioned old currency notes. The Indian government claims that the demonetization effort is to stop the counterfeiting of the current currency notes allegedly used for funding terrorism across the border by the neighboring countries, and as an attack on the black money in the country. The move was initiated as to curb corruption, trafficking of drugs, and smuggling across borders. The supply of currency notes of all denominations has seen an increase by about 40% during the period between 2011 and 2016, the Rs. 500 and Rs. 1,000 denomination notes has increased by 76% and 109% respectively during this period due to forgery. This forged cash is usually used to fund various terrorist activities against India. The outcome of the decision is to eliminate the Currency notes of selected denominations has been taken Governor of the Reserve Bank of India and Economic Affairs Secretary; Nations demonetize their local units of currency for various reasons. Some include combating inflation or corruption, and to discourage a dominative cash system.

The Indian government's aim was to control the counterfeit currency, scrap tax evasion, abolish black money generated out of money laundering and terrorist funding activities, and to promote a cashless economy. By announcing the larger denomination notes to be useless, the individuals and various black money launderers with huge collection of black money generated from the parallel black cash systems were affected and made to convert the cash money through a banking system which requires tax information from the entity. In case, if the entity is not providing any proof of paying any tax on the cash, a 200% penalty of the tax owed was imposed. Besides combating black money, the purpose mentioned is also to curb fake currency (financing terrorism) and also corruption. It was estimated that as on 28 October 2016 the total currency notes in circulation in India was about Rs. 17.77 trillion (US\$260 billion). Based on the annual report of Reserve Bank of India (RBI) as on 31 March 2016 the total bank notes in circulation was valued to Rs. 16.42 trillion (US\$240 billion) in which approximately around 86% (around Rs. 14.18 trillion (US\$210 billion)) were just Rs. 500 and Rs. 1,000 banknotes. It was 24% (around 22.03 billion) in terms of the total volume in the 90266 million banknotes which were in circulation till 8<sup>th</sup> Nov 2016. Between November 10<sup>th</sup> of 2016 and November 27<sup>th</sup> of 2016, all the banks have reported that the total exchange and deposits of demonetized currency notes are of worth Rs. 8.45 trillion (US\$130 billion) (exchange of Rs. 339.48 billion (US\$5.0 billion) and deposits are of Rs. 8.11 trillion (US\$120 billion)). During the same period of time, an amount of Rs. 2.16 lakh crore (US\$32 billion) was withdrawn by the people from their bank account

**Effect of Demonetizations: 2016:** Demonetization had created various impacts on the economy. Most of the sectors where transactions are done on cash basis were affected highly. Somewhere it was boom where in other sectors temporary slowdown was found.

- 1. Temporary Liquidity shortage:** It was the time when people were standing in long queue to exchange the money. The highly used denomination currency is Rs.500. People were not getting that money currency. There was a shortage of currency which was clearly observed.
- 2. Time of Currency Shortage:** reports suggested that all printing presses could print 2000 million units of RS 500 notes by the end of year. Nearly 16000 million Rs 500 notes were in circulation as on end March 2016. Some portions of this were replaced by the new Rs 2000 notes. Towards end of March approximately 10000 million units were printed and replaced.
- 3. Loss daily Wages Workers:** Most of the poor section of society uses cash for their livelihood. They depend most of the time on cash basis transactions as such they receive wages on daily basis in cash. Due to shortage of cash it was assumed that companies will try to lower down cash expenses and may reduce their labour cost. Because of shortage of cash poor section of society including

labourers and workers will not get enough wages and salaries.

4. **Consumption affected:** Consumption was adversely affected because of the liquidity problem and the entire cycle was disturbed temporarily.
5. **Loss of Growth Momentum:** India wants to be fastest growing economy but due to liquidity position there was a doubt on growth position in India. On account of liquidity crisis GDP and income figures were also at risk.
6. **Impact on bank deposits and interest rate:** For short run, deposits with banks were hiked as people deposited their money to convert their old currency into new one but once when the new currency supply in the economy was full-fledged once again people had withdrawn their money from the banks. The amount which was deposited by the people are not for investment but to maintain liquidity position. Interest rates were predicted to be reduced for short to medium term.
7. **Impact on black money:** The problem of black money had been addressed only to limited extent, because only a few portion of black money is held in cash and rest of black money is held in assets and proper ties. The extent of holding black money is depending on the amount of black money held in the form of cash. However, this measure had created huge awareness among the public and citizens of the country to address the issue of black money.
8. **Impact on fake currencies:** The major impact will be on fake currency as its circulation will be checked after this exercise.

**V) Conclusion:** After this detail and logical analysis demonetization seems to be a different task while it is compared to the other economical reforms undertaken by the governments to restore or to control the economy from being ruined by the black money and tax evasion. Demonetization seems to be a bitter pill and through the various historical evidences it is clear that the management of the crisis after the demonetization plays an importance role in success of it. Better preparedness is necessary in terms of a clear game plan and in terms of policies and strategies of government machinery itself and half of the success is seemed to be achieved just through the right way of communicating the government's intentions and foreseen outcomes with its useful to the country as a whole. In short run it ruins the economy with its side effects clearly inflicting its horror on the GDP. It deeply impact on the primary agriculture and industrial sectors resulting in job losses. Especially unemployment arising out of complete shutdown of the unorganized and the cash based small scales industry which actually comprises of about 80% of India's GDP. With a clear and efficient way of using the technological advantages India have in terms of the digitization and IT revolution it has gone through over the last two decades. The success and efficiency of implementing demonetization lies in the preparedness of the entire economy, the government machinery and the awareness amongst the general public and the entire political system being taken into confidence through an effective communication by all means and by transparent approach of the government in implementing Demonetization.

## **NEW TECHNOLOGY IN BANKING SECTOR IN INDIA**

**Dr. G. S. Shikhare**

*Principal, Swayam Siddhi Mitra Sangh's Degree College, Bhiwandi.*

### **Introduction:**

The new technology in banking has added a different dimension to the banking sector. The technological development in banking can be traced as follows:-

**1960** - Mechanized banking introduced.

**1970** - Introduction of computer based banking industry.

**1980** - Introduction of computer-linked communication based banking.

As per the reports of RBI the first wave in banking technology began with the use of Advanced Ledger Posting Machines (ALPM) in the 1980s. The RBI advised all the banks to go in for huge computerization at the branch level. The **Second wave of development** was Total Branch Automation (TBA) which came in late 1980s. In the **third wave**, the new private sector banks entered into the field of automation. The **fourth wave** started with the evolution of the ATM delivery channel. The various innovations in banking and financial sector are ECS, RTGS, EFT, NEFT, ATM, Retail Banking, Debit & Credit Cards, free advisory services, implementation of standing instructions of customers, payments of utility bills, fund transfers, internet banking, telephone banking, mobile banking, selling insurance products, issue of free cheque books, traveler's cheques and many more value added services. The change has been very productive for banks bringing in an increase in productivity and operational efficiency to be more competitive. Better risk management due to centralization of information and real time availability of critical data for decision making.

### **II) Objectives of the Study**

1. To study the various financial innovation in banking sector.
2. To study the changing scenario of Indian banking.
3. To study the advantages of e banking to the customers in India.

### **III) Innovation in banking sector**

Today we have electronic payment system along with currency notes. India's financial sector is moving towards a scenario, where it can have new instruments along with liquidity and safety. Important stages in the evolution of new age payment systems in India are as follows.

- i) Arrival of card - based payments- debit card, credit card- late 1980's and early 1990's.
- ii) Introduction of Electronic Clearing Service (ECS) in late 1990's
- iii) Introduction of Electronic Funds Transfer/ Special EFT (EFT/SEFT) in the early 2000's
- iv) Real Time Gross Settlement (RTGS) was introduced in March 2004
- v) Introduction of NEFT (National Electronic Funds Transfer) as a replacement for EFT/SEFT in 2005/06

Electronic fund transfer system became necessary due to the large volumes of transaction, high cost of physical handling and storage of paper instruments, delay in realization is a common feature and payment takes time. RBI has taken two major steps to tackle this problem. i) Use of Magnetic Ink Character Recognition (**MICR**) technology and ii) Introduction of Electronic Clearing Service (ECS).

**IV) E-Banking Services Introduced by Banks in India:** Information technology offers a chance for banks to build new systems that address a wide range of customer needs including many that may not be imaginable today. Following are the innovative services offered by the industry in the recent past:

**1. Computerization in Banks:** Technology has charged the face of the Indian banking sector through computation, while new private sector banks and foreign banks have an edge in this regard. Among the total number of public sector bank branches, 97.8 percent are fully computerized at end of March 2010 whereas all branches of SBI are fully computerized.

**2. ATM:** ATMs are an issue of survival for the banks and are becoming just another part of everyday life. The Automated Teller Machine is an effective delivery channel, which play a vital role in consumer satisfaction and cost control of transaction of banks. ATM card is magnetic stripe card which operate with particular PIN Number. ATM card is used for balance enquiry, cash withdrawal fast cash updating of cash book, utility bill payments etc. Banks are now using ATMs for product promotion as banks market broader financial services to their captive audience of ATM users. Total number of ATM In the year 2013 was 114,014 and increased as 160,055 in the year 2014.

**3. NEFT/RTGS:** Real Time Gross Settlement system, introduced in India since March 2004, is a Interlink Research Analysis system through which electronics instructions can be given by banks to transfer funds from their account to the account of another bank. NEFT means national electronic fund transfer system and RTGS means Real Time Gross Settlement System which enables an effective service, economical and reliable system of transfer of funds from bank to bank as well as from remitter's account in a particular bank to beneficiary's account in another bank across the country. IT is useful to customers to transfer funds from one bank branch to another branch and also another bank.

**4. Internet Banking:** Internet banking is a retail banking which enables customers to operate his account from anywhere and anytime. Internet banking provide fund transfer, credit PPF Account, request issue D.D., request for loan, utility bill payments , online bill payments, online ticket booking, online share trading, credit card payment, LIC premium payments, online donation etc services are internet banking services. The Internet has emerged as one of the major distribution channels of banking products and services for banks. Consumers are embracing the many benefits of internet banking like improved customer access which facilitates the offering of more services and attract new customers.

**Advantages of Internet Banking:**

- i) With e-banking services, one can actually carry out a number of transactions sitting on one's seat with just a few clicks.
- ii) Customers view their account balance and also open fixed deposits, transfer funds, pay electricity, telephone or mobile phones bills and much more.
- iii) The accounts of the customers are updated as soon as the transaction takes place i.e., the accounts show the information updated to the last second.
- iv) Lesser staff required to the banks for its day to day operation system.
- v) Online banking has encouraged people to carry out their bank transactions from a distance.

**5. Mobile Banking:** Mobile banking services is provided by banks on request of customers. This service is provided with secure ID and password to customers mobile banking offer fund transfer, immediate payments service, cheque book request, bill payments, mobile and DTH recharge, e commerce transactions etc.

**6. SMS Banking:** This service is provided with the help of mobile phone of the customers. It offers balance enquiry, last three transactions statements, cheque status and alert for password generations etc.

**7. Telephone Banking:** Bank provides this service with the help of telephone to customer's services is provided with secure ID and TPIN number. Telephone banking provides balance enquiry, last three transaction statements, cheque status enquiry, change of TPIN etc service.

**8. Cards Facility:** Banks provide different debit cards and credit cards facility. With the use of these cards customer can purchase, can make ecommerce transaction, and also can pay bills etc. The total

number of credit cards issued by all commercial banks in the year 2013 was 20 million and decreased as 19 million in 2014 i.e reduced by 1.7 %

**9. Electronic Payment Services - E Cheques:** Nowadays we are hearing about e-governance, e-mail, e-commerce, e-tail etc. In the same manner, a new technology is being developed in US for introduction of e-cheque, which will eventually replace the conventional paper cheque. India, as harbinger to the introduction of e-cheque, the Negotiable Instruments Act has already been amended to include; Truncated cheque and E-cheque instruments.

**10. Electronic Clearing Service (ECS):** Electronic Clearing Service is a retail payment system that can be used to make bulk payments/receipts of a similar nature especially where each individual payment is of a repetitive nature and of relatively smaller amount. This facility is meant for companies and government departments to make/receive large volumes of payments rather than for funds transfers by individuals. In the year 2009-10 the total number of ECS credit and debit transactions was 1, 17,833 and 69,819 respectively.

**Advantages of ECS – Credit**

- i) No need to make frequent visits to bank for depositing physical paper instruments.
- ii) No possibility of loss of instrument and fraudulent encashment.
- iii) No chance of delay or return in realization of proceeds as in the case of paper instruments.
- iv) Save on administrative machinery for printing, dispatch and reconciliation.
- v) Avoid the chance of loss of instruments in postal transit.
- vi) Avoid the chance of frauds due to fraudulent access to the paper instruments and encashment.
- vii) It can be ensured that the beneficiary's accounts get credited on a designated date.

**Advantages of ECS - debit**

- i) Eliminates the need of physical visit and the trouble of standing in long queues for making payment.
- ii) There is no need to track down payments by last dates.
- iii) Saves on administrative machinery for collecting the cheques, monitoring their realization and reconciliation.
- iv) Better cash management.
- v) Avoids chances of fraud.
- vi) Receives payments on a single date.

These schemes were introduced when Indian banking was in infant stage of its computerization hence cost benefits could not be maximized.

**11. Tele Banking:** Tele Banking facilitates the customer to do entire non-cash related banking on telephone. Under this devise Automatic Voice Recorder is used for simpler queries and transactions. For complicated queries and transactions, manned phone terminals are used.

**12. Electronic Data Interchange (EDI):** Electronic Data Interchange is the electronic exchange of business documents like purchase order, invoices, shipping notices, receiving advices etc. in a standard, computer processed, universally accepted format between trading partners. Electronic Data Interchange (EDI) can also be used to transmit financial information and payments in electronic form.

**VI) Energy Management and Move towards 'Green Technology':** Most of the banks are conscious of the carbon foot print generated and are working towards energy management and use of 'Green Technology'. Some of the measures adopted are:

Adoption of Server Virtualization technologies to save on

- floor space, power & cooling components,

- Use of Data center enhancements and Best practices for optimum usage of space, hot air/cool air pockets etc.,
- Up gradation of older power hungry Servers, Storage and
- Networking equipments.
- Solar powered ATMs
- Use of windmill energy
- Energy management and adoption of green technology will become increasingly important in the future and banks will have to streamline efforts towards accurately monitoring, measuring and optimizing the energy consumption.

**VII. Conclusion:** Over the last three decades the role of banking in the process of financial intermediation has been undergoing a profound transformation, owing to changes in the global financial system. The various innovations in banking and financial sector are ECS, RTGS, EFT, NEFT, ATM, Retail Banking, Debit & Credit Cards, free advisory services, implementation of standing instructions of customers, payments of utility bills, fund transfers, internet banking, telephone banking, mobile banking, selling insurance products, issue of free cheque books, traveler's cheques and many more value added services. Information Technology does promise to change the pace of banking to the next few years. Mobile bank and internet banking are going to make indoor in the banking sector in the near future.

## **ECONOMICS AND MANAGEMENT OF FOOD WASTAGE AT DOMESTIC LEVEL**

**Dr. (CA) Chandrashekhar D. Deore**

*Head of the Department of Accountancy, K.P.B.Hinduja College of Commerce, 315, New Charni Road, Mumbai, 400004*

**INTRODUCTION:** Economics is defined as the social science that studies the production, distribution, and consumption of goods and services (Krugman and Wells). Food is an integral part of goods and services. Economics is also defined as a science which studies human behaviour as a relationship between ends and scarce means which have alternative uses (Lionel Robbins). Food scarcity has reached such levels that millions of people have to sleep empty stomach and even die due to starvation and malnutrition. Even then, the evils like food wastage continue to haunt us. Attempts are being made to highlight the issue of wastage of food at public places but the food wastage at domestic level by the households is still not taken seriously and continues to go unnoticed. Food wastage at domestic level is an important issue in economics, which seldom has got the requisite attention. Beyond the ethical issue behind the food wastage, there is also an economical angle. Therefore, there is an urgent need to address this issue of food wastage at domestic level by the households. The objectives of the study are to understand the reasons for the food wastage at domestic level and also its financial implications. The study also aims to create awareness and to suggest the possible remedies for avoiding the food wastage at domestic level. The research is based on primary data collected from 121 respondents through a questionnaire containing 21 questions. The study concludes that the food wastage at domestic level is avoidable and so needs an immediate attention. It is not just a financial loss but also a social crime. The study provides some remedies to reduce the food wastage at domestic level. The study can be used to create awareness amongst the people. It can help people reduce their expenses on food and thereby increase their disposable income. It can also help to reduce the inflation in the food prices by reducing the demand. Also, it can help to save scarce resources in the form of food and eliminate a social stigma like starvation. The study, thus, is an attempt to blend the benefits of economics with the ethical question of food wastage and bring to the forefront a significant issue like food wastage at domestic level.

### **OBJECTIVES:**

The objectives of the present study are

1. To understand the reasons for the food wastage at domestic level.
2. To understand the financial implications of food wastage at domestic level.
3. To create awareness for the need to avoid food wastage at domestic level.
4. To suggest the possible remedies for avoiding the food wastage at domestic level.

### **RESEARCH DESIGN:**

**Type of Research:** The research is an empirical study based on survey method.

**Sources of data Collection:** For the purpose of the research, both the Primary as well as secondary sources of data have been used. The Primary Data have been collected through a structured Questionnaire containing 21 questions as well as through informal personal interviews. The Secondary data have been collected through websites, etc.

**Sampling Design:** The study is based on the primary data collected from the 121 selected respondents from the residents of Mumbai and Thane District. The respondents were selected on the basis of convenient sampling.

**Data Analysis:** The data have been analyzed by using the descriptive tools and techniques like frequency tables, percentages, graphs, etc. The objectives have been verified with the help of the interpretations made with the help of the above mentioned tools and techniques of data analysis.

**OBSERVATIONS, FINDINGS and INTERPRETATIONS:**

The respondents were asked 21 questions related to their habits with respect to buying the food, storage of food, cooking of food, eating habits etc. The respondents were given multiple choices for the questions of which they had to select their answers. The statistical analysis of the 121 valid responses is given below.

**Observations and findings related to questions on reasons for food wastage at domestic level:**

1. 63 % of the respondents buy more food than what is required.
2. 58% of the respondents agree that food gets wasted at their homes due to lack of proper storage.
3. 68 % of the respondents normally cook more food than what is required.
4. 43 % of the respondents serve more food than required.

**Interpretation:** A major reason for the food wastage at domestic level is the indifferent /careless attitude while buying, storing, cooking and serving food.

**Observations and findings related to questions on leftover food wastage at domestic level:**

1. 49 % of the respondents finish their meals with something still left in their plate.
2. 25% of the respondents don't give their leftover food to anyone. Others do so only occasionally.
3. 53 % of the respondents don't re-use their leftover food or do so only occasionally.

**Interpretation:** There is a careless or negligent attitude with respect to wasting the food in the plates as well as for the use of leftover food.

**Observations and findings related to questions on financial savings by avoiding food wastage at domestic level:**

1. 70 % of the respondents think that they can make a sizeable or large amount of savings by avoiding food wastage.
2. 45 % of the respondents feel that a saving of Rs500-1500 & even more can be made by avoiding food wastage.

**Interpretation:** Food wastage at domestic level has financial implications and leads to sizeable financial loss.

**Observations and findings related to questions on remedies for avoiding food wastage at domestic level:**

1. 98% of the respondents feel that food wastage at domestic level is avoidable.
2. 45 % of the respondents feel that food wastage can be avoided by either creating social awareness/by being more disciplined/by proper use of the leftover. Rest 55 % think all of these steps need to be taken.

**Interpretation:** Awareness on the issue of food wastage at domestic level is required.

**Observations and findings related to questions on perception of the respondents on food wastage at domestic level:**

1. 52% of the respondents think that major reason for food wastage is due to a combination of lack of social responsibility, indiscipline and careless attitude. Rest 48% attribute this to any one of the above reasons.
2. 57 % of the respondents feel that food wastage is a social crime resulting in loss of useful and scarce resources which leads to a financial loss also. Rest feel that it's any one of these.

3. 71 % of the respondents felt that this survey was completely/to a great extent useful to them to realize the need to save food being wasted at domestic level. Rest feel that it was useful to a certain extent.

**Interpretation:** In general perception, respondents felt that food wastage at domestic level is a serious moral as well as financial issue and needs to be addressed immediately.

**CONCLUSIONS:**

Based on the data analysis, observation, findings and interpretation, it can be said that all the objectives have been verified. The following conclusions can be drawn from the research.

- 1) Food wastage at domestic level is avoidable.
- 2) It is not just a financial loss but also a social crime.
- 3) It destroys the scarce and useful natural resources.
- 4) The food saved can help us to solve the problem of starvation and malnutrition.
- 5) There is an immediate need to create awareness about the food wastage at domestic level.

**SUGGESTIONS:**

- 1) Buy less, eat fresh.
- 2) Food is God, respect it, store it properly.
- 3) Ask before you cook or order.
- 4) It is not 'Being mean', it is 'Being wise'.
- 5) Serve less food, there is always a next time.
- 6) Never leave your meal unfinished.
- 7) Do not waste the leftover food.
- 8) Recycle the unavoidable waste.

## **RETAIL MANAGEMENT CHALLENGES AND OPPORTUNITIES IN INDIA**

**Dr. Vilas S. Epper<sup>1</sup> & Vaishnavi Vilasrao Epper<sup>2</sup>**

<sup>1</sup>*Asso. Professor Dept of Commerce, Dr. Babasaheb Ambedkar Marathwada University, Aurangabad*

<sup>2</sup>*Asst. Professor Dept of Commerce, Chatrapati Mahavidyalay , CIDCO N-3 Aurangabad*

**Introduction:** Retailer is most important mediator between the final consumer and manufacturer. In the marketing retailer has gets the profit share from 5% to 50% and more than, it means we can understand that how the influence on the manufacturer and overall marketing management. All the manufacturing units are not excuse from the retailers, example Pharmaceuticals, Engineering, durable goods, Agricultural, Industrial, cloth, jewelery etc. but the retailers playing the vital role from the beginning in the market and in the all types of market. Hence the meaning of Retailing is the sale of goods to end users, not for resale, but for use and consumption by the purchaser. Retail involves the sale of merchandise from a single point of purchase directly to a customer who intends to use that product. The single point of purchase could be a brick-and-mortar retail store, an Internet shopping website, a catalog, or even a mobile phone. The retail transaction is at the end of the chain. Manufacturers sell large quantities of products to retailers, and retailers attempt to sell those same quantities of products to consumers. In this paper researcher has endeavor to understand the role and importance. To understand the challenges and opportunities in front of retailing business in the globalization and changing scenario of global and national market. The is descriptive nature and depends on the secondary data.

### **Objectives of the study**

1. To study of Retailing Business in India
2. To understand SCM through retailing
3. To know the Challenges in retailing
4. To understand the opportunities in retailing
5. To find out the employment opportunities to the local people.

**Research Methodology:** This is descriptive nature hence only secondary data has been used. For the purpose secondary data it has used the internet and website.

### **Why Is Retailing Is Important?**

Retailers are the final link in the “supply chain” between manufacturers and consumers. It means supply chain management and its success of any types of products are depends on the retailing management. Retailing is important because it allows manufacturers to focus on producing goods without having to be distracted by the enormous amount of effort that it takes to interact with the end-user customers who want to purchase those goods. Retailers provide proper service and reasonable price and should make the purchase of goods easy for the consumer. That's why retail stores have salespeople, why Internet shopping websites have customer service instant chat popups, and why catalogs have descriptions, photos, and toll-free phone numbers. Retailing is work and process about displaying products, describing the features and benefits of products, stocking products, processing payments and doing whatever it takes to get the right products at the right price to the right customers at the right time or Just In Time (JIS). Retailers has sell the goods to the customers as well as some retailers offer additional services to the retail transaction like personal shopping consultations, and gift wrapping to add something extra to the retail customer experience and exceed the retail customer experience.

**Supply chain and Logistics:** A supply chain is comprised of all the businesses and individual contributors involved in creating a product, from raw materials to finished merchandise. However the supply chain has to start from the point to find out the flow raw material availability, procurement, processing or assembling, packaging, branding, warehousing, transportation, dispatch and delivery of goods to the final users or consumers, and between this series the role of retailers are final and important. However some retailers are providing after sales services and listen complaints of their customers. Retailers are directly associated and connected with the customers which gives the business to the company by increasing the sale volume. Logistics is another field which got the important space in the supply of goods and services “Just in Time” which is a specialized field of its own comprised of shipping, warehousing, courier services, road/rail transportation and air freight and documentation. Retail companies become involved in supply chain management to control product quality, inventory levels, timing, and expenses. In a global economy, supply chain management often includes dealings with companies and individual contributors in other countries, which requires involvement in politics, trade and tariff laws, quality control, and international relationships.

#### **What's the Difference between Retail and Wholesale?**

Wholesalers sell in large bulk quantities, without worrying about many of the aspects of retailing those consumers expect like visual merchandising. Wholesalers do not want to deal with a large number of end-user customers. Rather, their goal is to sell large quantities to a small number of retailing companies. It is rare for a wholesaler to sell goods directly to consumers. The exception to that would be membership warehouse clubs like Costco, Sam's and Bj's wholesale. These members-only retail stores are a hybrid of wholesaling and retailing in that they sell directly to consumers, but they sell in large quantities, which often allow them to sell at prices that are lower than other retailers that sell in small quantities from impeccably merchandised stores in high-rent shopping districts. The big difference between wholesale and retail **is in the price**. The retail price is always more than the wholesale price. The reason for this is because the added cost of selling merchandise to end-user customers - labor, rent, advertising, etc. - is factored into the pricing of the merchandise. The wholesaler doesn't have to deal with such expenses, which allows him to sell goods at a lower cost.

**Supply Chain Work and role of Retailing:** Successful supply chain can provide the success to the businessman. However the retail supply chain consists of manufacturers, wholesalers, retailers and the consumer (end user). The wholesaler is directly connected to the manufacturer, while the retailer is connected to the wholesaler, and not to the manufacturer.

Here are the roles of the key players in a typical retail supply chain:

**Manufacturers** – Produce the goods, using machines, raw materials, and labor

**Wholesalers** – Purchase finished goods from the manufacturers and sell those goods to retailer in large bulk quantities

**Retailers** – Sell the goods in small quantities to the end-user at a higher price, theoretically at the MSRP (Manufacturer's Suggested Retail Price).

**Consumer** – End user who buys the goods (or “shops”) from the retailer for personal use.

There are exceptions to this traditional supply chain, however. Some of the world's largest retail companies like Walmart, and Amazon.com, for example, are large enough to deal directly with manufacturers, without the need for a wholesaler in the middle of the transaction.

#### **What are Different Types of Retail Stores?**

**Department Stores:** Sell a wide range of merchandise that is arranged by category into different sections of the physical retail space. Some department store categories include shoes, clothing, beauty

products, jewelry, house wares, etc. Examples of department store retailers include Macy's, Nordstrom, and jcpenny, to name just a few.

**Grocery Stores and Supermarkets:** Sell all types of food and beverage products, and sometimes also home products, clothing, and consumer electronics as well.

**Warehouse Retailers:** Large no-frills warehouse-type facilities stocked with a large variety of products packaged in large quantities and sold at lower-than-retail prices

**Specialty Retailers:** Specialize in a specific category of products. Toys 'R' Us, Victoria's Secret, and Nike are examples of specialty retailers.

**Convenience Retailer:** usually part of a retail location which sells gasoline primarily, but also sell a limited range of grocery merchandise and auto care products at a premium "convenience" price from a brick-and-mortar store

**Discount Retailer** – Sell a wide variety of products are often private labeled or generic brands at below-retail prices, Discount retailers like Family Dollar, Dollar General , and Big Lots will often source closeout and discontinued merchandise at lower-than-wholesale prices and pass the savings onto their customers.

**Mobile Retailer** - Uses a smartphone platform to process retail transactions and then ships the products that were purchased directly to the customer.

**Internet E-tailer** –Sell from an Internet shopping website and ship the purchases directly to customers at their homes or workplaces and without all the expenses of a traditional brick-and-mortar retailer, usually sell merchandise for a lower-than-retail price

**Store manager:** A retail manager is the person ultimately responsible for the day-to-day operations of a retail store. All employees working in the store report to the retail manager. A store manager reports to a district or general manager.

#### **Responsibilities of a store manager include**

- Overall care of staff and their well being
- Presentation of store and advertising displays
- Recruiting, performance management, and workplace scheduling
- Product management, including ordering, receiving, price changes, handling damaged products, and returns
- Team Development, facilitating staff learning training, and development
- Problem solving, handling unusual circumstances
- To understand the customer service principles
- To handle problems and questions to customers
- Basic Computer applications in stores management and materials control

#### **Stores management**

**Sales generation:** A store manager must meet the monthly, quarterly, or annual sales goals, depending on the company's fiscal cycle. This involves setting individual sales goals (quotas), holding contests for employees, or offering sales promotions. The manager may also find ways to make employees more productive to meet the goals. Thus, the store manager may be forced to reduce payroll expenditures by decreasing employees' hours, or otherwise reducing operating cost. A store manager should motivate his or her team to achieve the target set for the store. A store manager should set an example for his or her subordinates to follow.

**Safety and security:** The Store manager is the store's primary key-holder and may be called to the store before, during, or after business hours in the event of an emergency. They are also responsible for the safety of all customers and employees on store premises. Store managers may be required to hold safety meetings, especially as dictated by union practices in cases where store employees belong to a union

**Division of responsibility:** A store manager may have several subordinates who have management-level responsibility. These employees may be called assistant managers, department managers, supervisors, key holders, shift leads, or leads. A store manager has over-all responsibility for all day-to-day activity of the store. Managing & controlling staff, and planning are essential points of the store manager

**Hiring, training and development:** The store manager is responsible for hiring, training, and in some cases, development of employees. The manager must ensure staffing levels are adequate to effectively operate the store, and ensure employees receive training necessary for their job responsibilities. Managers may be responsible for developing employees so the company can promote employees from within and develop future leaders, potentially for employment at other locations. The role of store managers with regards to the other employees varies from company to company and each respective company's operating methods but in general a store manager will be required to deal with and try to solve any and all problems that may occur at any given time

**Indian retail industry - Challenges and Opportunities:** India occupies a remarkable position in global retail industry. The country has emerged as a dynamic player in every industry vertical primarily because of frequent new entries of enterprises and startups in business on a daily basis. India is one of the fastest growing retail markets in the world placed as world's fifth-largest global destination in the retail space. According to a report by Wall Street Journal the retail industry contributes nearly 22% of the country's GDP. Growing purchasing power, public consumption, burgeoning expenditure, rapid urbanization as well as entry of foreign players into the domestic market are the key growth enablers for the sector. Indian retailing sector is now perforated by availability of international brands, emerging number of shopping malls and hypermarkets and extensive proliferation of e Commerce. The end benefactors of these developments are of course the general consumers, who are the target audience of retail businesses. The progressing retail industry has impacted Indian consumers in a number of ways. Improvement of lifestyle and raised standard of living are the direct impact of retail developments on consumers. Burgeoning international presence in India retail industry is increasing exposure of Indian consumers to international brands. In a similar fashion, the industry has helped a lot to boost the general awareness of consumers. Although the retail industry of the country is growing by leaps and bounds, it is difficult for emergent enterprises to sustain in this domain. The reasons being several challenges in the long term run, the sector is an unpredictable market. The Indian Retail Industry is expected to grow from US\$330 billion in 2007 to US\$640 billion by 2015. According to the 10th Annual Global Retail Development Index (GRDI) of A.T. Kearney, India is having a very strong growth fundamental base. This is the reason why the present times the perfect to foray into Indian Retail Market. Indian Retail Market contributes to 8% of the total employment. The total retail spending is estimated to double in the next five years. Of this, spending on organized retail is estimated to be 21% of total expenditure. The unorganized retail sector, on the other hand, was expected to grow at about 10% per annum with sales valuation amounting to \$309 billion in 2006-07 to \$496 billion in 2011-12. In India, the impetus of government in developing the retail sector is massive. The government is allowing foreign direct investment in multi brand retailing as a measure to make India more attractive to overseas investors. The proposal was piloted by the Department of Industrial Policy and Promotion (DIPP). Liberalization of FDI in multi brand retail is a boost to the retail sector. It is with a phased liberalization approach with

a number of conditions laid down for foreign retailers to enter India. The conditions while laying the foundation for FDI in retail was intended to assure the opposition parties, the local retailer lobbies, the farmer and trade union etc. The government adopted a balanced midway kind of approach after due consideration of the views of all stakeholders involved. Though Indian retail industry has enough potential, a number of challenges loom over the sector. Of this, the lack of quality human resources and inability of domestic manufacturers to meet international requirements are the major ones. Manpower source have never been an issue in India but retailing industry requires trained manpower. It is very difficult to find skilled human resource for the sector as skill development in India is still on a nascent stage. Recently government has taken massive initiative to skill the youth populace of the country through the flagship program called Skill India. The program is rolled out keeping in view the massive requirements of skilled workers in niches such as retail, manufacturing, customer services and other such trades. The competition from the unorganized sector is another threat to retail segment in the country. There has been a stiff competition between unorganized and organized retail sector of the country. A report by D&B indicated that unorganized retail sector in the country constitutes of 94% of the total retail sector. There has been a lack of recognition of retail segment as an industry from government fronts. However, the recent landscape has changed massively with many initiatives directed towards reforming the sector in the country. The financial infrastructure of the nation is inadequate to support massive growth of organized retailing. Apart from these reasons, lack of adequate infrastructure and high cost of commercial real estate has been the major lacunas for the sector. Furthermore, the nexus of these factors materialize poor standard retail brands, which cannot compete with their international counterparts. India is growing to be an economically developed nation with high purchasing power, leaving aside the poverty of a segment of its populace. Economic diversity of the nation is massive. Against such backdrop, the retail industry has been flourishing throughout the nations with many newly introduced enterprises in the sector. Retail, comprising of both organized and unorganized sector, is an easy industry to foray into and is always open for public ventures. The new policies of the government are presenting a fillip in the landscape only to boost the sector. Employment provided by various sectors- and Retailing Business Employment Opportunities Feb.2015 to Feb-2016 Trends of employment

Industry Division of Employment	Feb 2015 000 %	May 2015 000 %	Aug 2015 000 %	Nov 2015 000 %	Feb 2016 000 %	Change employment % Feb-15 to Feb16

## **IMPACT OF RELATIONSHIP MARKETING ON CUSTOMER LOYALTY IN NEPALESE COMMERCIAL BANKS**

**Saroj Kumar Bista**

### **Introduction:**

Banking industries are very competitive, and it is difficult for banks to provide unique banking services as required by clients. To overcome this challenge banks can benefit from superior relationship marketing, because the clients focus on the service aspect of the bank and the level of interaction when evaluating a service firm. Firm's and client relationships in service industries are important as they influence the satisfaction, support and retention of banking clients. Moreover, previous studies have shown that there is a significant positive relationship between the client relationship and level of service quality of banks (Rootman, 2006). Relationship marketing has received much attention in both academy and practice areas in the last few decades. Over the last decade relationship marketing began to dominate the marketing field (Egan, 2003). Relationship marketing is concerned about building customer loyalty by providing value to all the parties involved in the relational exchanges as, customer loyalty is the final goal of relationship marketing (Peng and Wang, 2006). Customer relationship management is about managing customer knowledge to be understood and serve them and it is a multi-dimensional concept which places customers at the center of an organization where customer service is an important component of customer relationship management, however this notion is also concerned with coordinating customer relations across all business functions (Bose and Sugumaran, 2003). Customer loyalty is winning the confidence of the customers in favor of an organization such that the relationship becomes a win-win situation for both the organization as well as the customer. For this reason, it is pretty important in intensively competitive environment to be in regular contact with the customers and to follow the changes in them closely (Abbasi et al., 2010). The key element of customer loyalty is the nature of the relationship between the customer and the provider of the products and services i.e. banks (Khan et al., 2012). Thus, complaint handling, service quality, convenience, pricing of the product and services, and offers and benefits are commonly noted as a critical prerequisite for satisfying and retaining valued customers. Guriting and Oly Ndubisi (2006) revealed that relationship marketing dimensions such as trust, commitment and conflict handling have a direct effect on customer loyalty. The purpose of relationship marketing is to gain the maximal value of a customer; customer loyalty should be emphasized to achieve this goal. The benefits of relationship marketing derive from the continuing patronage of loyal customers who as a partnership are not sensitive to price cut over time (Bowen and Shoemaker, 2003). Interdependence, mutual cooperation and commitment between supplier and customer is the key to competitive advantage (Hougaard, and Bjerre, 2002). The ultimate goal of customer relationship management is not only to attract new client but also sustain the existing client's base at its maximum level of satisfaction because of this it has great importance for the marketing managers. Today's customers are looking for various benefits from bank better service quality, lower transactions fees, complain handling, a sign of prestige, new products access from different channel and this scheme forces the banks to look for a new way to satisfy customers before any other bank or financial intuition does (Winer, 2001). Ward and Dagger (2007) suggested that it is very important to understand the dimensions of relationship marketing by management and marketing staff as these will ultimately underpin the strength of relationship development between service provider and customer. In this competitive environment, understanding the nature of these relationship marketing constructs is vital for implementing effective relationship marketing strategies. Raciti et al. (2013) revealed that

consumers desire to participate in a relationship influenced their level of motivation, degree of confidence and these, in turn, impacted on the consumers' sense of affiliation with the service provider. A consumer's sense of affiliation subsequently influenced the strength of their relationship and their level of satisfaction with the relationship. Additionally, the effect of relationship desire on relationship strength and satisfaction was apparent. Consumers' desire indirectly impacted on retention intentions, suggesting that service managers should be careful not to assume that consumers' deliberate choice to participate in a relationship will routinely result in loyalty. Camarero (2007) referred to four types of relationship marketing investments commitment trust, values and communication. Expenditures on all forms of relationship marketing investment have positive impact on interaction, feedback from customers and two-way communication (Bennett and Barkensjo, 2005). Relationship marketing practices and their association with these positive outcomes, particularly leads to customer loyalty. Worthington and Horne (1998) revealed that relationship marketing is being put forward as a new paradigm for marketing and is particularly relevant for the marketing of financial services, with their potential for long term and wide relationships between financial institution and customer. The study identified the organizational factors that strengthen/weaken the impact of usage of marketing metrics on CRM performance. Based on the customer value-based theory of the firm and the contingency perspective, a research framework was developed to shed light on the predictor roles of customer value-based organizational culture and processes in determining usage of marketing metrics, and foster an understanding of the moderating roles of marketing-supply chain conflict, and innovative value proposition on the marketing metric-performance relationships (Yee, 2011). Ferguson and Hlavinka (2007) revealed that banks are customizing their relationship building strategies to create value propositions as unique as the institutions and customers they serve. Moreover, the study suggested that when the banks use loyalty programs to build trust and confidence in the brand, the customer relationship will develop organically, and so will profits. Lacey and Morgan (2008) suggested that customers with stronger levels of commitment are indeed more willing to contribute as customer advocates. Moreover, the study pointed out that relationship marketing represents a dramatic change in buyer-seller interactions from the previous transaction-based marketing that focused on a single transaction. Effective relationship marketing heavily relies on developing strategic partnerships with customers (Kurtz and Boone, 2005)

In the context of Nepal, Pandey and Joshi (2010) revealed that customer's satisfaction had direct relationship with behavior intension of the customer, but customer satisfaction had worked as a mediator between customer service quality and behavior intensions. Bhattacharya (2011) revealed that customer relationship management is a tool for organization to reduce cost and increase company performance, which means profitability result through customer loyalty. The above discussion reveals that there is no consistency in the findings of various studies concerning the studies on impact of relationship marketing on customer loyalty. The major objective of the study is to analyze the factors affecting customers' loyalty in Nepalese commercial banks. More specifically, it examines the relationship between trust, commitment, communication and complaint handling with customer loyalty of Nepalese commercial banks.

The remainder of this study is organized as follows: Section two describes the sample, data and methodology. Section three presents the empirical results and the final section draws conclusion and discuss the implications of the study findings.

**2. Methodological aspects:** This study is based on primary data which were gathered from the 103 respondents, which mainly deals with the relationship marketing and customer loyalty in Kathmandu valley. Questionnaire survey was designed to understand the view of respondents in Customer loyalty.

A set of questionnaire with different section was prepared in the ‘Google Forms’ and distributed online to the customers of different banks.

**The Model:** As a first approximation, this study assumes that customer loyalty depends on several dimensions (trust, communication, commitment, conflict handling). Therefore, the regression model used in this study takes the following form:

$$CL = \beta_0 + \beta_1 TR + \beta_2 COM + \beta_3 CH + \beta_4 CMT + \varepsilon \dots \dots \dots (i)$$

**Where,**

CL = customer loyalty, T = trust, COM = communication, CMT = commitment and CH = conflict handling, e = error term and  $\beta_1, \beta_2, \beta_3, \beta_4$  are the intercept of the explanatory variables to be estimated.

**Trust:** Trust is defined as a willingness to rely on an exchange partner in whom one has confidence. According to Morgan and Hunt (1995), marketing is built on the foundation of trust. It ensures that the relational exchange is mutually beneficial, as the good intentions of partners are not in doubt. Customers buying services are specially benefited by the existence and development of trust (Berry, 1983).

*H1: There is a positive relationship between trust and customer loyalty.*

**Commitment:** According to Morgan and Hunt (1994), commitment is defined as the enduring desire to maintain a valued relationship. This implies a higher level of obligation to make a relationship succeed and to make it mutually satisfying and beneficial. Berry (1983) revealed that there is a positive relationship between commitment and customer loyalty. Based on this, the study develops following hypothesis:

*H2: There is a positive relationship between commitment and customer loyalty.*

**Conflict handling:** According to Kotler and Keller (2006), complaint is a statement that a situation is unsatisfactory or unacceptable. It is an expression of grief, pain, or dissatisfaction made to an organization, related to its product or services, or the complaint handling process itself. The complaints have the potential to cause several negative consequences. Dwyer et al. (1987) revealed a positive relationship between conflict handling and customer loyalty. Based on this, the study develops following hypothesis:

*H3: There is a positive relation between conflict handling and customer loyalty.*

**Communication:** According to Naoui and Zaiem (2010), communication is defined as the consumer's perception of the extent to which a retailer interacts with its regular customers in a warm and personal way. Boedeker (1997) argued that communication positively influences on customer loyalty. Based on this, the study develops following hypothesis:

*H4: There is a positive relationship between communication and customer loyalty.*

**3. Results and discussion**

**Correlation analysis:** The Pearson’s correlation coefficients have been computed to analyze the strength of linear relationship between selected factors and customer loyalty towards the relationship marketing and customer loyalty in Kathmandu valley and the results are presented in Table 3.1.

**Table 1: Pearson’s correlation matrix for the relationship marketing and customer loyalty**

*This table reveals the Pearson’s correlation coefficients between dependent and independent variables. Customer loyalty (CL) is the dependent variable and CL customer loyalty, T = trust, COM = communication, CMT = commitment and CH = conflict handling are the independent variables.*

Model	Mean	S.D	TR	CMT	COM	CH	CL
TR	4.38	0.59	1				

<b>CMT</b>	4.26	0.58	0.73**	1			
<b>COM</b>	4.34	0.59	0.74**	0.75**	1		
<b>CH</b>	3.95	0.63	0.56**	0.65**	0.59**	1	
<b>CL</b>	4.36	0.60	0.61**	0.70**	0.71**	0.61**	1

The table shows that the average value of trust is 4.38. Likewise, the average value of commitment is 4.26. Similarly, the average value of communication, conflict handling and customer loyalty are 4.34, 3.95 and 4.36 respectively.

The result shows that trust is positively related to customer loyalty. This means that increase in the trust leads to increase in the customer loyalty towards commercial banks. Similarly, commitment is positively correlated to customer loyalty. This indicates that increase in commitment leads to increase in the level of customer loyalty.

Likewise, the result shows that communication is positively related to customer loyalty. This indicates that betterment in the communication leads to increase in the customer loyalty. Likewise, the result shows that conflict handling is positively correlated to customer loyalty. This means that betterment in the conflict handling leads to increase in the customer loyalty.

#### Regression analysis

Having indicated the Pearson correlation coefficients, regression analysis has been conducted and the results are presented in Table 3.2.

#### Table 2: Regression results of T, CMT, COM, and CH on customer loyalty

The result are based on pooled cross sectional data and impact of relationship marketing and customer loyalty with 102 observations of 2017 survey using linear regression model. The model is  $CL = \beta_0 + \beta_1 T + \beta_2 COM + \beta_3 CH + \beta_4 CMT + \epsilon$ . where, dependent variable is CL (customer loyalty) and independent variables are T (trust), CMT (commitment), COM (communication) and CH (conflict handling).

Model	Constant	Regression coefficient of				Adj-R <sup>2</sup>	SEE	F
		T	CMT	COM	CH			
1	1.64 (4.71)*	0.62 (7.85)*				0.37	0.47	61.59
2	1.39 (4.60)*		0.70 (9.95)*			0.49	0.41	98.99
3	1.32 (4.27)*			0.70 (9.95)*		0.49	0.42	98.23
4	2.08 (6.94)*				0.58 (7.70)*	0.36	0.48	59.29
5	1.06 (3.48)*		0.37 (3.77)*	0.40 (4.12)*		0.55	0.38	61.43
6	0.94 (3.03)*	0.16 (1.46)**	0.32 (3.05)**	0.32 (2.89)**		0.56	0.38	42.15
7	0.89 (2.81)**	0.13 (1.20)**	0.29 (2.63)**	0.31 (2.81)**	0.82 (0.95)**	0.56	0.38	31.8

#### Notes:

- \*. Results are significant at the 1% level.
- Figures in parentheses are t-values.
- Customer loyalty is dependent variable.

The table shows that beta coefficient is positive and significant for trust. It indicates that higher the trust, higher would be the customer loyalty. This finding is similar to the findings of Thureau (2002). Similarly, the beta coefficient is positive and significant for commitment. This means that higher the commitment, higher would be the customer loyalty. This finding is consistent with the findings of Berry (1983).

Likewise, the result shows that beta coefficient is positive and significant for communication. This means that higher the communication, higher would be the customer loyalty. This finding is similar to the findings of Van Vuuren et al. (1998). Similarly, beta coefficient is positive and significant for conflict handling. It indicates that better the conflict handling, higher would be the customer loyalty. This finding is consistent with the findings of Dwyer et al. (1987).

#### 4. Summary and conclusion

Commercial banks are one of the vital aspects of the economy dealing with the process of canalizing the available resources in the needed sectors. In the recent years, the banking industry around the world has been undergoing a rapid transformation. Today, the basic element of modern business understanding is customer satisfaction and customer loyalty (Ross, 1995).

This study attempts at determining the factors affecting customer loyalty. The study is based on primary data of 20 commercial banks with 103 observations. This study hypothesizes that the customer loyalty depends on different variables such as trust, communication, commitment and conflict handling.

The correlation analysis shows that trust, communication, commitment and conflict handling are positively related to customer loyalty. It reveals that higher the trust and commitment, higher would be the customer loyalty. This also indicates that better the use of communication and conflict handling, higher would be the customer loyalty.

The regression analysis shows that trust and commitment have positive impact on customer loyalty. Similarly, communication and conflict handling also have positive impact on customer loyalty. This indicates that increase in trust and commitment leads to increase in the customer loyalty. It also reveals that increase in the use of communication and conflict handling leads to increase in the customer loyalty.

## **GOODS AND SERVICES TAX AND INDIAN ECONOMY**

**Dr. D.G.Ushir**

*Department of Economics, K.T.H.M.College, Nashik*

**Introduction:** The word tax is derived from the Latin word “taxare” which means to estimate. A tax is an enforced contribution, exacted pursuant to legislative authority. Indian Taxation System comprise of- Direct and Indirect Tax. Goods and Services Tax (GST) is one of the most discussed Indirect Taxation reforms. It is a comprehensive tax regime levied on manufacture, sales and consumption of goods and services. It is expected to bring about 2% incremental GDP growth of the country. So, GST is the need of the hour. Initially the idea was that there would be a national level Goods and Services tax. But as the release of first discussion by the empowered committee of the state Finance Ministers on 10.11.2009, it has been made both the governments are entitled to charge taxes on the goods and services. Almost 150 countries have introduced GST in some form. France was the first country to introduce GST in 1954. While countries such as Singapore and New Zealand tax virtually everything at a single rate, Indonesia has five positive rates, a zero rate and over 30 categories of exemptions. In China, GST applies only to goods and the provision of repairs, replacement and processing services. GST rates of some countries are - Australia 10%, France 19.6%, Canada 5%, Germany 19%, Japan 5%, Singapore 7%, Sweden 25% and New Zealand 15%. World over in almost 150 countries there is GST. Under the GST scheme, no distinction is made between goods and services for levying of tax. This means that goods and services attract the same rate of tax. GST is a multi-tier tax where ultimate burden of tax fall on the consumer. It is called as value added tax because at every stage, tax is being paid on the value addition. Under the GST scheme, a person who was liable to pay tax on output, whether for provision of service or sale of goods, is entitled to get input tax credit on the tax paid on its inputs. Since VAT was beneficial for the taxation system but with certain shortcomings which are expected to be overcome by the Goods and Service Tax. Thus, it would definitely a positive reform for the Indirect tax system in India.

### **Objectives of study**

- To collect information of current tax system and analysis of tax by GST
- To study the concept of Goods and Services Tax (GST) and its impact on Indian economy.
- To understand how GST will work in India.
- To know the benefits of GST in India context.

**Concept:** GST is an indirect tax which will include almost all the indirect taxes of central government and states governments into a uniform or whole tax. As the name suggests it will be levied on both goods and services at all the stages of value addition. It has dual model including central goods and service tax (CGST) and states goods and service tax (SGST). CGST will subsume indirect taxes like central excise duty, central sales tax, service tax, special additional duty on customs; counter veiling duties whereas indirect taxes of state governments like state vat, purchase tax, luxury tax, octroi, tax on lottery and gambling will be replaced by SGST. Integrated goods and service tax (IGST) also called interstate goods and service tax is also a component of GST. It is not an additional tax but it is a system to examine the interstate transactions of goods and services and to further assure that the tax should be received by the importer state as GST is a destination based tax.

### **Benefits of GST**

1. A single registration for both CGST & SGST will reduce transaction costs and also unnecessary wastages. To make this more effective Government has to provide necessary IT infrastructure & integration of States level with the Union.
2. With the introduction of GST, Tax on Tax i.e. multiplicity of taxation will be eliminated, A number of taxes currently levied on each level of transaction will be reduced. This will help clearing the confusion created by existing indirect taxes and also reduce the paper work associated with them.
3. There won't be any fear of taxation that may crop up at any stage of supply chain. This will not only help the business community to decide price modalities and supply chain but also the consumers in the long run. The goods will be competitive as the price will not be the main focus but the innovation and business intelligence will be.
4. Consumers will be benefitted the most as the average tax burdens will be reduced with the introduction of GST.
5. Implementation of GST will help reduce the corruption in the country, because GST reduces the multiple tax system.
6. Due to full end seamless credit manufactures or traders do not have to include taxes as a part of their cost of production which is very big reason to say that we can see a reduction in prices. However, if the government seeks to introduce GST with a higher rate this might be lost.

**Impact of GST on Indian Economy:** A midst economic crisis across the globe India has posed on a beacon of hope with desirable growth targets, various schemes or missions like Make in India, Digital India etc. The Goods and Service Tax (GST) bill is expected to provide the much needed pace for growth of economy in India by transforming the existing complicated taxation system into single point taxation system in the country. Uniformity of tax will lead to single point taxation for supply of goods or services across country. GST would improve the country's tax to GDP ratio and also prevent inflation. However, with GST manufacturing sector may be benefitted but things may get difficult for the services sector. It is expected that the GDP growth is likely to be raised up to 1 to 2%, but the results can only be analyzed after the implementation of GST. By merging large no. of Centre and State taxes into one single point taxation system will reduce burden on producers and foster growth through more production. Various toll plazas and tax barriers leads to a lot of wastage for perishable items being transported which leads into the increase the costs of goods. GST could eliminate this road block which leads to lowering of prices for essential goods. GST would prove to be beneficial for the manufacturing sector where the tax rate is very high like FMGC, Auto and Cement sectors as they are currently reeling under 24 to 38%. The service sector is going to be adversely affected as the current rate of tax is much lower than expected rate of GST. GST would also add to government revenue by widening of the tax base. GST would be beneficiary for the sectors like FMCG, Pharmaceuticals, Consumer durables, Automobiles and logistic industries and will have negative impact on telecom, banking and financial services.

#### **Impact of goods and service tax**

**Fast moving consumer goods sector:** The Indian FMCG sector is the fastest growing sector in the economy. FMCG sector is the major contributor in both direct and indirect taxes in the economy. Implementation of Goods and services tax will majorly influence Indian economy. The current rate of taxation in FMCG sector is around 22 to 25% and after GST rate is expected to be much lower which will result in reduction of prices of consumer goods.

**Food Industry:** A large portion of consumer expenses of lower income families spend on food so if there is any tax on food will influence majority of the population or may be regressive in nature. In some of the countries like Canada, UK and Australia tax on food items is while in some countries like

Singapore and Japan tax on food is negligible. So it would be ideal if the GST rates may be zero or would be very low as it would affect people quite significantly.

**Information Technology enabled services:** The IT industry will not hamper by the implementation of GST. The expected rate of GST in IT sector is 27%. According to proposed plan if software transferred through electronic form will be considered under services and if by any other media it would be under goods. So the IT industry will make mix taxation.

**Infrastructure sector:** Development of Roads, Power, Railways, and Ports etc. are the major infrastructure sectors in India. As the taxation system in infrastructure sector is very complex. There are exemptions and subsidies for this sector as it is very important for the development of the country. By the implementation of GST the complex tax will be removed and would increase tax base.

**Real Estate Industry:** The implementation of GST on real estate sector will effect partially. As the sale or transfer of immovable properties are not included in GST. However the procurement of materials of construction is falling under GST. The classification of goods and services is very important under this sector because it is very necessary to classify the things which will cover under GST and which are not. The implementation of GST will affect same as in service sector.

**Transportation Industry:** GST on transport sector will result in more efficient cross state transportation. It will bring down the logistics cost, reduced times for Transportation. Currently all the 29 states of India collect taxes at different rates on goods that move across the state borders that's why the tax on transportation is collected multiple times. This will make long delays at different interstate checkpoints for reviewing by state authorities who checks for the application of relevant taxes and other levies. This causes the delays for an average of 6 to 7 hours. GST would replace around 15 state and federal taxes and tariffs for a single tax at the point of sale of goods.

**Pharma Industry:** India is the largest producer of Generic Medicines and the country's pharmaceutical Industry is 3rd largest in the world currently. The implementation of GST would have a constructive effect on Healthcare industries particularly Pharma. It will help the industries by sorting out the taxation structure since 8 different types of taxes are enforced on pharmaceutical industries today. The merger of all the taxes into one uniform tax will ease the way of doing business. GST would also improve the transportation and supply chain of pharmaceutical products.

**Textiles Industry:** It is expected that the tax rate in GST would be higher in textile industry as per the current tax rate. Cotton and wool fibre which are currently exempted from tax would come under tax in GST but the textile industry may be beneficial from GST as manufacturing costs ,may be reduced due to subsume of various taxes like octroi, entry tax, luxury tax etc. There will be few drawbacks also but GST will support the industry in long run.

**Services Sector:** Services sector of India consists of 60% of the GDP. The GST rate for services is expected to be 18to 20% which is higher than the current rate of tax that is 15%. So there will be increased cost for services like Banking, Insurance and Telecom.

**Agriculture Sector:** The GST on agriculture sector will have a positive impact as all the taxes will be subsumed under a single rate of tax. So the movement of agriculture commodities between states will be easier & hassle free which will save time and remove wastages for the transportation of perishables items.

**Conclusion:** Taxation system is very important for the economy because they maintain equity of income group. Consumption and productions of goods and services undeniably rising and because of multiplicity of taxes in current tax system organization complexities and conformity cost is also increasing. Accordingly, a simplify user -friendly and transparent tax system is required. At present Indian economy have a major change in the taxation system. On 1st July the new tax system will be

implemented that is Goods and Services Tax (GST). It will solve the problem of complexity of tax system because it will replace the current tax system of India. A single tax system will remove all other complex taxes of centre and state government like Vat, Cenvat, Luxury tax, Octroi, Entry tax etc. By the implementation of GST cost of manufacturing of goods will reduce. The cost of consumer goods will reduce. The Pharmaceutical industry is also benefitted as there is 8 types of taxes are bear by them in current scenario after GST these taxes will remove to one single tax. Similarly the impact of GST on all other sectors like Infrastructure, textile, IT, Agriculture, Food Industry, Transport, Real Estate Industry will positive and all the sectors will be n benefitted with implementation of GST. No doubt that GST will give India a world class tax system by grabbing different treatment to manufacturing and service sector. GST will provide relief to producers and consumers by providing g wide and comprehensive coverage of input tax credit set off. Service tax set off and subsuming the several taxes. GST is likely to improve tax collection and Boost India's economic development.

## **GST IN INDIAN ECONOMY**

**Dr. S. K. Dhage**

*Head, Dept of Economics, Baburaoji Gholap College, Sangvi, Pune-27*

**Introduction:** GST stands for Goods and Services Tax. It is a domestic trade tax that will be levied in the form of a value added tax on all goods and services - in practice with some exemptions. A value added tax exempts all inputs including capital goods. Hence, it becomes a general tax on domestic consumption. In order to ensure that the tax burden is distributed according to the consumption of different individuals, it must be levied on the basis of the principle of destination, that is to say that the tax on a good should go to the state in which the concerned consumer lives. This automatically takes place if the tax is levied at only the central level, or if the state is a unitary one with only one level of taxation. GST will simplify and harmonise the indirect tax regime in the country. It is expected to reduce cost of production and inflation in the economy, thereby making the Indian trade and industry more competitive, domestically as well as internationally. It is also expected that introduction of GST will foster a common or seamless Indian market and contribute significantly to the growth of the economy. Further, GST will broaden the tax base, and result in better tax compliance due to a robust IT infrastructure. Due to the seamless transfer of input tax credit from one stage to another in the chain of value addition, there is an in-built mechanism in the design of GST that would incentivize tax compliance by traders.

**Taxation of Job Work under GST Regime:** GST law has changed the whole scheme of taxation relating to job work. As per section 1(68) of the central goods and services tax act, 2017, job work has been defined in an exhausted manner. The job work now includes any treatment or process undertaken by a person on goods belonging to another registered taxable person. Now if specified conditions and procedures are followed, the materials and semi finished goods sent by registered principal to job worker will not fall within the ambit of supply and accordingly the same shall not be liable to GST. Conditions and procedures for sending goods to job work without payment of duty GST law mentions the following conditions and procedures for sending goods and materials without payment of duty to the job worker: The principal must be a registered person. The inputs should be received back within one year and capital goods within 3 years of their being sent. However condition of being received back does not apply to moulds, dies, jigs and fixture or tools. The principal is required to maintain proper records of inputs and capital goods which are sent to the job worker. The benefit of sending goods and materials without payment of duty to the job worker will be available in both intra-state and inter-state transfers for job work. At the time of removal and for the purpose of transportation, goods should be issued under the cover of a challan serially numbered. Three copies of delivery challan should be prepared, original for job worker, duplicate for transporter and triplicate for principal. When the goods are sent through delivery challan, the same needs to be declared in form GST. The principal may send the inputs and capital goods directly to the premises of job worker without bringing to the premises of principal the input tax credit can be availed by the principal on inputs or capital goods sent to job worker. If inputs are not received back within one year and capital goods within 3 years of their being sent, would be treated as supply and accordingly principal should be liable to pay GST. The provisions and relaxations relating to job work will be applicable only if principal is a registered person and he sends taxable goods for job work. Thus, if either the principal is not registered or the goods to be sent to job work are non taxable or exempted, the provisions and relaxations relating to job work will not

apply. Relaxations to job worker under GST law the job worker under the GST law has been given the following relaxations: The job worker is not required to obtain registration unless his aggregate turnover exceeds the threshold limit of 20 lakhs/10 lakhs If the principal declares premises of unregistered job worker as his additional place of business or if the job worker is a registered person or if goods are notified by the principal, principal may supply the goods directly from the premises of job worker without bringing back to his own premises and this will not be included in the aggregate turnover of job worker. However, only value of goods or services used by the job worker for carrying out the job work will be included in the turnover of job worker. If the job worker is a registered person, waste and scrap generated during the job work can be supplied by job worker directly from his place of business on payment of tax. However, if job worker is not a registered person the same is required to be supplied by the principal on payment of tax. Further only principal is required to maintain proper accounts related to job work.

### **Benefits of GST**

1. Avoidance of Cascading effect: One of the major contribution of GST for the business and commerce is the elimination of cascading effect. At present, there are different indirect tax levies at state level and centre level that are compulsory along the supply chain till the time of its utilization.
2. Growth of Revenue in States and Centre: It is expected that the introduction of GST will increase the tax base, but lowers down the tax rates and also remove the multiple points of taxation. It will lead to higher amount of revenue to both the states and the union.
3. Reduces Transaction costs and unnecessary wastages: If government works in an efficient mode, it may be also possible that a single registration and single window compliance will suffice for both SGST and CGST, provided government takes measures to create effective IT infrastructure and integration of such infrastructure at states level with the union.
4. Eliminates the multiplicity of taxation: One of the great advantages that a taxpayer can expect from GST is elimination of multiplicity of taxation.
5. One Point Single Tax: Another feature that GST has is 'one point single taxation'. This will give a lot of confidence to business community and encourage them to focus on business rather than endlessly worrying about taxes that may crop up at a later stage. This will help the Indian businesses to stay globally competitive as price will no longer be the function of tax components, but of business intelligence, quality and innovation.
6. Reduction of average tax burden: Under GST scheme, the cost of tax that consumers have to bear will be definite and certain, and GST would reduce the average tax burdens on the consumers.
7. Lessens the scope of corruption: Corruption is a serious problem which is confronted by the Indian economy. We cannot expect anything substantial unless there exists a political will to root it out. The goods & services tax will play an instrumental role in freeing our tax authorities from the shackles of corruption and bribery, as it will lower the scope of corruption through simplification of tax procedures.

**Prospects of Implementing GST:** The introduction of Goods and Service Tax (GST) in India is now on the horizon. The Constitution Amendment Bill to replace existing multiple indirect taxes by uniform GST across India. 1. The current indirect tax structure is major impediment in India's economic growth and competitiveness. Tax barriers in the form of CST, entry tax and restricted input tax credit have fragmented the Indian market. Cascading effects of taxes on cost make indigenous manufacture less attractive. Complex multiple taxes increase cost of compliance. In this scenario, the introduction of GST is considered. 2. Removal of tax barriers on introduction of uniform GST across the country with seamless credit will make India a common market leading to economy of scale in production and efficiency in supply chain. It will expand trade and commerce. GST will have favorable impact on

organized logistic industry and modernized warehousing. 3. Electronic processing of tax returns, refunds and tax payments through 'GSTNET' without human intervention, will reduce corruption and tax evasion. Built-in check on business transactions through seamless credit and return processing will reduce scope for black money generation leading to productive use of capital. 4. Major beneficiary of GST would be sectors like FMCG, Pharma, Consumer Durables and Automobiles and warehousing and logistic industry. 5. High inflationary impact would be on telecom, banking and financial services, air and road transport, construction and development of real estate.

**Challenges for Success In India:** Looking to the global developments and tax structure of developed countries, India needs comprehensive levy and collection on both goods and services. The following are identified as major challenges for the success of GST in India:

- There are various definitional issues related to manufacturing, sale, service, valuation etc. arises. These needs to be rationalized.
- Several transactions take the character of sales as well as services, thus there is complexity in determining the nature of transaction.
- The mechanism of imposing taxes, exemptions, abatements, other benefits are different in state and centre.
- Existing law has resulted in significant number of issues related to interpretation or various provisions and the category of the products and the nature of services.
- Administration mechanics of the centre and state and even in different states is different.
- A simple tax structure can bring greater compliance, thus increasing number of tax payers and in turn tax revenues of Government.
- GST will ensure competitive pricing. Tax paid by final consumer will come down in most cases. Lower prices will help in boosting consumption which is beneficial to Companies. GST will ensure boost to exports. When the cost of Production falls in the domestic market, Indian Goods and services will be more price competitive in foreign markets.
- The current state of Indian Economy demands fiscal consolidation and reduction in Fiscal deficit. A recent Report by CRISIL states that GST is the country's best bet to achieve fiscal consolidation.

**Conclusions:** Taxation plays an significant role in the development of the economy as it impacts the efficiency and equity. It is expected that a good system should control income distribution and at the same time it will also endeavour to generate tax revenue which will support government expenditure on public services and development of infrastructure. GST will have positive impact on Indian economy. GST have faced lots of controversy and opposition in terms of its implementation. Finally the GST bill has been passed and it ready to roll out in market. Time will only decide whether it will have positive impact or negative impact. International trade , firms and consumer will have new system of tax which is single level and more transparent. The new system of taxation is considered to be more improved system over the preexisting central excise duty at the national level and sales tax system at state level. The new tax will be significant breakthrough and a logical step towards a comprehensive indirect tax reforms in the country. GST is not only Vat plus service tax but it is major improvement over previous VAT system. A single of tax will help maintain simplicity and transparency by treating all goods and services equal without giving a special treatment to some types of goods and services. It will reduce the litigation on classification of issues. It is also said that implementation of GST in Indian framework will lead to commercial benefits which VAT has not given and hence it would essentially lead to economic development. GST may assure the possibility of overall gain for industry , trade , agriculture and also to central and state government. Now Indian consumer need to have professionalism to acknowledge the

GST. It is sure that India will join the international standards of taxation , corporate laws and managerial practices and also be among the world leaders.

## **DIGITAL EMPOWERMENT: COMPETENCY AMONG HIGHER EDUCATION STUDENT**

**Dr. Vanjari Sandip Bhausaheb**

*Dept. Of Comm., Deogiri College, Aurangabad.*

**Introduction:** Digital India is an exceptionally large transformative program undertaken by the government to transform the Indian society as well economy in the digital form. The vision and mission of the program is to connect at least 2.5 lacs villages through internet service before 2018 and gradually it will increase up to 6.5 lacs villeges up to 2020. Under the digital India program, government wants to establish digital empowerment in the society, to make available all digital resources universally accessible in all local languages to the stakeholders, to make an availability of all services in digital form, make an awareness among the all stakeholders to advantages of the digital use and encourage the people to adopt and use the services in digital form. For the success of the digitalization program government develops 9 basic pillars as basic sector will have to be develop with digital services such as broadband highway, public internet access, Information to all, e-kranti Universal access, IT jobs, E-governance and Electronic manufacturing. Through Digital India program government trying to reach up to every segment of the society but it is not easy task due to the high different educational, cultural and geographical background population of the country. More than 15-20 ministries included to implementation of this program and up to 2020 government want to make an arrangement of Smartphone to everyone. Being India is highest economy to providing higher education in the world, government would have to use the higher education students as the resources to accomplishment of objective of digital literacy. Every educated student is representing his family, colony, area, village or suburb. If higher education students take initiatives to become success of digital literacy program it will become more effective. This research paper is basically trying to focus on the digital empowerment and percentage of use of the digital resources and competency amongst higher education students.

**Objective:**

To overview of Digital India and Digital Competency of Higher Education Student.

To focus on the importance of competency of higher education students in digitalization program.

**Research Methodology:** This Research Paper is constructed on the basis of primarily data which is collected from the Pilot survey of 100 higher education students from different colleges of Aurangabad city only. Deliberate sample method and Secondary data from various sources which include different articles, Journals, Article, Magazines, Periodicals, Research Works, News Papers, web sites of government of India for digital literacy and all the research related Web sites.

**Research Question:** There is no association with the education and competency of the higher education student.

**Digital Empowerment:** The digital empowerment of society means to availability and competency of access, consume and produce online information using digital interventions and ICT tools. This mission is basically formed to enabling stakeholders to access better health, education, skill and livelihood opportunities through digital literacy and digital tool. Indian government has established different stage wise governance to successfully accomplishment of the target of the mission.

**Higher Education Student:** As per HRD Ministry survey announcement made on 5<sup>th</sup> jan 2018, overall enrolment form 27.5 million in 2010-11 to 35.7 million in 2016-17 and improvement in gross enrolment ratio which is a ratio of enrolment in higher education to population In the eligible age group (18-23)

years, from 19.4% in 2010-11 to 25.2 in 2016-17 which is a significant achievement. Higher education students share in the India is quite good and it has been beneficial to digitalization.

**SFCVCC Model:** India is going towards the historic transformation of all services made available through digital resources it means they are convert it from cash to cashless. As per Swami Vivekanada said “Education is the manifestation of perfection in Man”. Education is the more important and impactful factor in the success of every innovation. Higher education students can play very important role to success of such program. The SFCVCC model helps the mission of the digital literacy. If they have competency to use the digital resources they can create the awareness of advantages of digital resources for all services to his family, area, village, Town as well as country. This model suggest a small step in digitalization mission and even already students are participating as volunteer through different initiatives like VISAKA(Vittiya Saksharta Abhiyan), they are doing well. If student participation in this mission more actively the success rate of such program will definitely high.

**SFCVCC Model: Student Survey:** The status of competency of digitalization among Higher Education Students is very important because these students can lead this mission of digitalization. For the purpose of analysis the competency in the higher education students, certain data are collected and relevant data are tabulated to test the hypothesis sentence.

Questions Answers & ↓      →	Bank Account	Use of Debit Card	Use of Credit Card	Use of NET Banking	Use of Online services
Yes	78	71	9	28	100
No	22	29	91	72	0
<b>Total</b>	<b>100</b>				

From the above graph it is clear that even we are taking the higher education students data for digital use, the data are collected from 100 students of higher education students. we found that almost 100% respondent are using online services from different purposes with the use of different resources, but there are another important truth is came out that 22 student does not having their own accounts in the bank, 29 students are not having debit card, only 9 students has credit cards, only 28 students are using the internet banking. Research Question of the research paper “There is no association with the education and competency of the higher education student” is accepted because as per the data figures represent that out of hundred student 22 student not having bank account 29 student not having debit card and only 9 student are using debit card and only 28 students are using internet banking but all students are fully aware about the all services offered by the government and every student has benefited some services offered by the online method.

**Conclusion:** Government of India is trying to solve the different economical problems like control on corruption, paper less work, provide lot of online services to all stakeholders, avoid the tax evasion, reduction expenses of money printing and save the time of stakeholders through digital mission. The digital India vision provides the intensified encouragement for future progress for this steps and this can be promote inclusive growth that covers electronic services. India in 21<sup>st</sup> Century strives to meet the aspirations of its citizens where government and its services reach the doorsteps of citizens and contribute towards a long lasting positive impact. Higher Education students are considering as the asset of the country therefore they can contribute their important role in the success of the digital mission program therefore there is a need to create competency among the higher educational student that will assists in the achievement of objectives of digitalization program.

**Suggestion:** Higher education students can shine in the accomplishment of the digital program objective hence; there is a need of establishment of strong monitoring system on different segment of the digital program. Competency among the higher education student needs to improve because they are the representative of his family, area, village or town hence that can be make an positive impact on success of digital program. Need to make updated clear cyber security act and adequate cyber security expert to establish the strong secure services to stakeholders. Organization of digital literacy program to higher education student as well as such programs needs to be organizing in rural and urban area. Project work shall be assign to the student on digital literacy program. Make a policy for rewards and awards for the best volunteer student.

## **RETHINKING OF SUSTAINABLE DEVELOPMENT IN THE VIEW OF ECONOMICS**

**Mr. Prashant Tanaji Nargude**

*Ph.D. Student, Department of Sociology, University of Mumbai, Mumbai, Maharashtra, India*

**Introduction:** India has been accepted mix economic model for development since its independence from the British Rule (1947). In 1991 India has become a part of Globalization process after declaring late Prime Minister P. V. NarasimhaRao. Development Alternatives the world's first social enterprise dedicated to sustainable development, is a research and action organisation striving to deliver socially equitable, environmentally sound and economically scalable development outcomes. DA's green technology innovations for habitat, water, energy and waste management, which deliver basic needs and generate sustainable livelihoods, have reduced poverty and rejuvenated natural ecosystems in the most backward regions of India. DA's Mission is to help eliminate poverty and regenerate the environmental resource base through methods that are highly scalable. Its activities broadly cover three primary areas that underlie any sustainable development process: the design and large-scale dissemination of appropriate technologies, rational environmental management systems, and equitable people-oriented institutions and policies. The DA Group innovates such eco-solutions to help meet the basic needs of all and works with partners, including government bodies, local entrepreneurs and civil society to market these in a commercially viable and an environmentally friendly manner to an ever-growing body of consumers. Development economics is a branch of economics which deals with economic aspects of the development process in low-income countries. Its focus is not only on methods of promoting economic development, economic growth and structural change but also on improving the potential for the mass of the population, for example, through health, education and workplace conditions, whether through public or private channels. A growing body of research has been emerging among development economists since the very late 20th century focusing on interactions between ethnic diversity and economic development, particularly at the level of the nation-state. While most research looks at empirical economics at both the macro and the micro level, this field of study has a particularly heavy sociological approach.

### **Statement of the Problem:**

- the fact that the global human ecosystem is threatened by grave imbalances in productivity and in the distribution of goods and services - as evidenced by the fact that a large proportion of the human population lives in poverty, and that a widening gap exists between those who benefit from economic and technological development and those who do not
- the fact that accelerating changes are occurring at the global scale, with rates of economic and social development outstripping progress in achieving internationally co-ordinated environmental stewardship - with the result that improvements in environmental protection due to new technologies are being 'cancelled out' by the magnitude and pace of human population growth and economic development.

### **Objectives of the study:**

1. To know the concept of Sustainable development and Economics.
2. To understand the relationship among Sustainable development and Economics.

**Research Methodology:** A study of the above mentioned subject requires taking specific steps to complete the research work successfully. The researcher has applied to Secondary research method for analysing the content of Rethink of Sustainable Development in the view of Economics.

**Sources of Data Collection:** The researcher has collected data through secondary sources like information getting through Journals, Articles, and Research reports, Internet, Books and Newspapers etc.

**Content Analysis:** A large number of industries have been established in the post-independence India in private, public and joint sectors. There are a lot of industrial resources and raw materials available in India. Bhilai, Bokaro, Rourkela, Ranchi, Jamshedpur, Renukoot, etc., emerged as major centres during the first one and a half decades of independence. However, later on, industrialisation at medium and small scale was taken up in all the states. The main sectors of industrialisation today are electronics, transport and telecommunication. Compared to advanced countries, there is very little industrialisation in India. About 10 per cent of the total workers are employed in the organised industrial sector. Both private and public sectors have grown side by side since independence. Growth in the industrial sector is one of the vital figures that affect the Gross Domestic Product (GDP) in India. This section provides information about the initiatives taken by the Union and state Governments to facilitate the industrial growth in the country. Details of industries like insurance, Micro, Small and Medium Enterprises, chemical, fertilizer, defence products, cottage, retail textile, pharmaceutical, manufacturing, etc. are provided for the users. The section also highlights schemes, documents, forms, acts, rules, policies, reports related to various industries and corporate governance. Manufacturing has emerged as one of the high growth sectors in India. Prime Minister of India, Mr NarendraModi, had launched the 'Make in India' program to place India on the world map as a manufacturing hub and give global recognition to the Indian economy. Sustainable development is defined as balancing the protection of the natural environment with the fulfillment of human needs so that these needs can be met not only in the present, but in the indefinite future. The term has prompted a global recognition of the close linkage between environmental health and human development, as well as the need to alter social and economic policies to minimize the human impact on the planet. First coined in 1980 by the International Union for the Conservation of Nature, "sustainable development" came into general usage following publication of the 1987 report of the Brundtland Commission. The commission's oft-quoted definition casts sustainable development as economic and social growth that "meets the needs of the present without compromising the ability of future generations to meet their own needs" (United Nations Department of Economic and Social Affairs 1987). The concept of sustainable development touches upon the fundamental relationship between human beings and nature. However, sustainable development is not a precisely defined term, and a wide array of views has fallen under its umbrella. Moreover, critics of the term note that it continues to participate in an anthropocentric (human-centered) viewpoint, which sees the natural environment as being in the service of human needs.

#### **Common principles**

Despite these different perspectives, a number of common principles are embedded in most charters or action programs to achieve sustainable development, sustainability, or sustainable prosperity. These include:

- Dealing transparently and systemically with risk, uncertainty, and irreversibility.
- Ensuring appropriate valuation, appreciation, and restoration of nature.
- Integration of environmental, social, human, and economic goals in policies and activities.
- Equal opportunity and community participation/Sustainable community.

- Conservation of biodiversity and ecological integrity.
- Ensuring inter-generational equity.
- Recognizing the global integration of localities.
- A commitment to best practice.
- No net loss of human capital or natural capital.
- The principle of continuous improvement.
- The need for good governance.

**Conclusion:** As a human being it is our foreground responsibility to protect to the environment. Economic practices are also needful to our society for fulfilling our basic and superior needs. We have to construct the breedge between environment and economy. Industry based economy must innovation in their plants and projects. Green development will play major role in present life style. The researcher is trying to focuses on some issues regarding sustainable development and economic practices.

## **INFLUENCE OF CONSUMER EXPERIENCE ON THE SATISFACTION OF MOBILE PHONES IN KATHMANDU VALLEY**

**Saujan MallaThakuri**

### **Introduction:**

According to Bolton and Drew (1991), customer satisfaction is a post-purchase evaluation of a service offering. A traditional definition of customer satisfaction followed the disconfirmation paradigm of consumer satisfaction/dissatisfaction (CS/D), suggesting that CS/D is the result of interaction between the consumer's pre-purchase expectations and post purchase evaluation. Cadotte et al. (1987) defined customer satisfaction as a state of mind in which the customer's needs, wants, and expectations throughout the product of service life have been met or exceeded, resulting in future repurchase and loyalty. According to Yi (1991), consumer satisfaction has been defined as the evaluation that the consumer experience is at least as good as it is supposed to be. The response of the consumer to the evaluation of the perceived differences between the prior beliefs (or a performance pattern) and the actual performance of the product, the way it is perceived after its consumption (Tse & Wilton, 1988). A recent and more concise definition is given by Oliver (1997) who defines satisfaction as the "response to consumer fulfilment". Churchill & Surprenant (1982) revealed that customer satisfaction is also defined as a result that comes from the pre - purchasing customer comparison among the expected performance, the perceived actual performance and the existing cost). Literature supports that customer satisfaction acts in two different ways: the satisfaction of a certain transaction and the overall satisfaction (Yi, 1991). Turkyilmaz & Ozkan(2007) showed that the level of satisfaction indicates to what extent customers are satisfied and to what degree their expectations have been confirmed. In this research, this factor evaluates the level of the total customer satisfaction, the fulfilment of their expectations and the efficiency of the company in comparison with the ideal. According to Rust & Zahorik (1993), the enormous competition in the area of mobile telephony services (MTS) has forced companies that are active in this field to find ways to cope with the great demands of the market and to increase their market share. For these enterprises, the increase in customer satisfaction is a fundamental goal, while their utter purpose is to enforce the customer loyalty to the company and to maintain long-term customer relationships (Kotler, 1982). Anderson and Jacobsen (2000) revealed that customer satisfaction is the foundation for any organization to achieve its objective. In other words, the degree of customer satisfaction reflects the rate of achievement of organizational objectives. Customers that are satisfied tend to create favorable and friendly relationship with the organization. The loyalty of a customer to the organization arises from the satisfaction received from the consumption, uses or services received from the organization. Hansemark(2004) found that satisfied customers are more likely to tell people about their experiences, more so, dissatisfied customer will also tell people about their experiences. Customer satisfaction is one of the business objectives, and can be achieved through understanding the needs of the target market, and the provision of needs satisfying packages in meeting and satisfying these needs at a greater extent, thus, building and maintaining long lasting and favorable relationship with the target market. Hoyer and MacInnis (2001) revealed that satisfaction is an overall customer attitude or behavior towards the difference between what customers expect and what they receive regarding the fulfilment of some desires and needs. According to Oliver (1997), satisfaction itself is a desirable state of consumption or patronization; it is a reinforcing, pleasurable experience. On the governmental level, customer satisfaction data are used to draft legislation. Kotler and Keller (2009) define satisfaction as a person's feeling of pleasure or disappointment resulting from comparing a

product's perceived performance (or outcome) in relation to his/her expectations. This definition is supported by many other studies, others define customer satisfaction as the feeling or attitude of customers toward a product/service after it has been used (Solomon, 1996). According to Dispensa (1997), when perceived performance matches or exceeds expectations, the customer becomes satisfied. Conversely, when perceived performance is below expectations, the customer becomes dissatisfied. Satisfied customers will repeat the purchase, be brand loyal, convey positive word-of-mouth advertising, and all these will enhance sales). Dissatisfied customers may stop buying the product, spread unfavorable word-of-mouth advertising, and may avoid the product manufacturer and the retailer (Hirschman, 1970). Ballantyne et al. (2005) defined brand image as the material property associated with the brand, such as the product name and the packing, which could make profits or sense for customers and help or increase describing the characteristics. Dobni (1990) treated brand image as the brand concept that customers held also stated that most brand image was subjectively perceived image, which was interpreted from the rationality or the sensitivity of customers. In addition, brand image did not exist in the technology, the function, and the product but affected by relevant marketing programs, campaign context, and the characters of the accepters. Wu and Fu (2009) argued that while referring to a brand image, the perception presented by the fact would be more important than the fact itself. Martin (1994) explained that brand image held by customers was the reactions mixed with marketing programs by the manufacturer also brand image included customer responses to brand name, sign, or impression and also represented the symbol of the product quality. Magid and Cox (2006) considered brand image as a set of assets and liabilities linked with brand name and sign that the assets and liabilities increased or reduced the value by the enterprise providing products or services for customers. Brand image included the customer responses to the brand name, sign or impression, and also represented the symbol of the product quality. Ballantyne et al. (2005) proposed reducing conceptual model verification with the effects of brand image and brand attitude. Three routes, in the model, were proposed to connect to brand right directly through the brand image and the brand attitude, and indirectly from the brand attitude through the brand image. Porter and Claycomb (1997) measured brand image from two dimensions, namely the symbol and the function. With adjectives to measure the two dimensions, the measuring items mainly focused on the utility of the brand regarding the function, while words like symbolic, reputable, status symbol, and identifiable were contained in terms of symbolic image. Aaker (1991) pointed out that, with the construction of good brand image, customers were likely to increase the satisfaction of usage, and would like to recommend to others. Gensch (1978) considered brand image as having more influence on the purchase intention and the satisfaction of customers while the product attribute was not easily defined. Graeff (1996) mentioned that, when the customer's self-image was more similar to the brand image, customer satisfaction would be affected. Romaniuk and Sharp (2003) found positive relation between brand image and customer satisfaction. Su and Youjae (2006) proposed that customer satisfaction referred to the pleasant attitude when a customer accepting certain deal or service; and, customer satisfaction and brand value appeared notably positive relation he also suggested that customer satisfaction and brand characteristics presented significantly positive relation that customer satisfaction was the provided service higher than the expectation of the customer so that the customer was satisfied. Kotler et al. (2007) revealed that a feature is an attribute of a product that to meet with the satisfaction level of consumers' needs and wants through the owning of the product, usage, and utilization of a product. The above discussion reveals that there is no consistency in the findings of various studies concerning the studies on customer satisfaction on mobile phones. The major objective of the study is to analyze the factors affecting customer satisfaction on mobile phones in

Kathmandu valley. More specifically, it examines the impact of brand image, persuasiveness, features, frequency of use on customer satisfaction on mobile phones in Kathmandu valley.

The remainder of this paper is organized as follows. Section two describes the data and methodology. Section three presents the empirical results and final section draws conclusions and discusses the implications of the study findings.

**2. Methodological aspects:** This study is based on primary data which were gathered from the 150 respondents which mainly deals with the influence of consumer satisfaction on mobile phones in Kathmandu valley. Thus, this study is based on 150 observations.

**The model :** As a first approximation, this study assumes that the customer satisfaction depends on the( job performance, employee commitment, customer loyalty and ethical leadership). Therefore, the regression model used in this study takes the following form:

$$\text{Customer satisfaction} = f(Bi, F, P, Fe)$$

More specifically,

$$CS = \beta_0 + \beta_1 Bi + \beta_2 F + \beta_3 P + \beta_4 Fe + e_i \dots \dots \dots (i)$$

**Where,**

CS= Customer satisfaction

Bi= brand image

F= Frequency of use of mobile phones.

P= persuasiveness

Fe= features of mobile phone

$\beta_0$  = Intercept of the dependent variable

$e$  = error term and  $\beta_1, \beta_2, \beta_3,$  and  $\beta_4$  are the beta coefficients of the explanatory variables to be estimate

**Brand image:** Brand image is the general impression of a product held by real or potential consumers. According to Porter & Clay Comb (1997), there is positive relationship between brand image and customer satisfaction. Likewise, Ballantyne et al. (2005) revealed that the customer are loyal to their brand image which showed that they are satisfied when they use their preferred brand products. Based on this, the study develops following hypothesis:

*H1: There is positive relationship between brand image and customer satisfaction.*

**Features:** The features of mobile phones are the set of capabilities, services and applications that they offer to their users. According to Ling et al. (2006), whenever a new feature is added into a mobile phone technology the chances of getting the customer satisfaction becomes high. Likewise, Bayraktar (2012) revealed that more the features in phone, higher will be the customer satisfied with it. Based on this, the study develops following hypothesis:

*H2: There is positive relationship between features of phone and customer satisfaction.*

**Persuasiveness:** Persuasiveness is the power to induce the taking of a course of action or the embracing of a point of view by means of argument or entreaty. Chang et al. (2009) revealed that people will be persuasive to buy the particular product when they are referred by some of the friends. Likewise, Suh and Youjae (2006) found that people will be more presided with the technology of the mobile phone they see in market. Based on this, the study develops following hypothesis:

*H3: There is positive relationship persuasiveness and customer satisfaction.*

**Frequency of use:** Frequency of use is the term describing how many times the particular product is used by the user. According to Ishii (2004), higher the use of mobile phones higher will be the interaction of the customer with other which reveals that higher the interaction higher will be the customer satisfaction. Shankar at al. (2003) revealed that the frequency of use of a product is directly

proportional to the customer satisfaction i.e. higher they use, higher will be the satisfaction. Based on it, this study develops the following hypothesis:

**H4:** *There is positive relationship between frequency of use and customer satisfaction.*

**3. Results and discussion**

**Correlation analysis:** On analysis of data, correlation analysis has been undertaken first and for the purpose, Pearson’s correlation coefficients have been computed and the results are presented in Table 1.

**Table 1: Pearson’s correlation matrix for influence of consumer experience on the satisfaction on mobile phones in Kathmandu valley**

*This table reveals the Pearson’s correlation coefficients between dependent and independent variables. Customer satisfaction (CS) is the dependent variable and brand image (bi), frequency of use (F), persuasiveness (P) and features (Fe) are the independent variables.*

Variables	Mean	S.D.	Bi	F	P	Fe	CS
Bi	2.13	0.59	1				
F	2.14	0.57	0.43**	1			
P	2.20	0.63	0.49**	0.43**	1		
Fe	2.22	0.67	0.55**	0.42**	0.52**	1	
CS	2.26	0.58	0.56**	0.43**	0.54**	0.53**	1

The asterisk signs (\*\*) indicates that correlation is significant at 1 percent level of significance.

The table shows that average value of brand image is 2.31. Likewise, the average value of frequency, persuasiveness and features are 2.14, 2.20 and 2.22 likewise, the average value of customer satisfaction is 2.26.

The result shows that frequency of uses positively related to customers’ satisfaction. This means that increased in the frequency of use leads to increase in the customer satisfaction. Similarly, persuasiveness is positively correlated to customers’ satisfaction. This indicates that increase in persuasiveness leads to increase in the level of customer satisfaction.

Likewise, the result shows that features is positively related to customer’s satisfaction. This indicates that increase in features leads to increase in the customer’s satisfaction. Likewise, the result shows that brand image is positively correlated to customer satisfaction. This means that increase in the brand image leads to increase in the customer satisfaction.

**Regression analysis**

Having indicated the Pearson correlation coefficients, regression analysis has been performed and the results are presented in Table 2.

**Table 2: Regression results of Bi, F, P and Fe on customer satisfaction**

*The result are based on 150 observations by using linear regression model. The model is  $CS = \beta_0 + \beta_1 Bi + \beta_2 F + \beta_3 P + \beta_4 Fe + e_i$ , where, dependent variable is CS (customer satisfaction) and brand image (bi), frequency of use (Fe), persuasiveness (P) and features (F) are the independent variables*

Model	Intercept	Bi	F	P	Fe	Adj. R <sup>2</sup>	SEE	F
1	1.08 (7.38)	0.55 (8.29)*				0.31	0.48	68.77
2	1.30 (7.83)		0.44 (5.93)*			0.18	0.52	35.25
3	1.14 (7.82)			0.50 (7.94)*		0.29	0.49	63.08

4	1.23 (8.83)				0.46 (7.68)*	0.28	0.49	59.11
5	1.08 (7.38)	0.55 (8.29)*				0.31	0.48	68.77
6	0.73 (4.68)	0.38 (5.33)*		0.33 (4.86)*		0.40	0.45	51.51
7	0.57 (3.41)	0.33 (4.55)*	0.15 (2.13)**	0.28 (4.13)*		0.41	0.44	36.68

Note:

1. Figures in parentheses are t-values.

2. The asterisk (\*\*), (\*) sign indicates that the results are significant at 1 and 5 percent level of significance respectively.

3. Customer satisfaction (CS) is a dependent variable.

The table shows that beta coefficient is positive and significant for brand image. It indicates that higher the brand image, higher would be the customer satisfaction. This finding is similar to the findings of Youl & John (2010). Similarly, the beta coefficient is positive and significant for frequency of use. This means that higher the frequency of use of mobile phones, higher would be the customer satisfaction. This finding is similar to the findings of Ishii (2004). Likewise, the result shows that beta coefficient is positive and significant for persuasiveness. This means that higher the persuasiveness, higher would be the customer satisfaction. This finding is similar to the findings of Khan (2007).

Similarly, beta coefficient is positive and significant features of mobile phone. It indicates that better the features, higher would be the customer satisfaction. This finding is similar to the findings of Salvendy (2006)

**4. Summary and conclusion:** In order to get customer satisfaction, mobile phone companies should focus on the factors that are likely to affect persuasiveness. Companies today are forced to compete and to act professionally in those harsh times. It is very important to have persuasive quality which can account on them to create competitive advantage

This study attempts at determining the factors affecting customer satisfaction on mobile phones. The study is based on primary data of 150 observations. This study hypothesizes that customer satisfaction depends on several factors such as brand image, persuasiveness, features and frequency of use of mobile phones. The correlation analysis shows that brand image, persuasiveness, features and frequency of use of mobile phones are positively related to customer satisfaction. It reveals that higher the brand image and frequency of use of mobile phones, higher would be the customer satisfaction. This also indicates that higher the persuasiveness and features of mobile phones, higher would be the customer satisfaction. The regression analysis shows that brand image and features of mobile phone have positive impact on customer satisfaction. Similarly, persuasiveness and frequency of use of mobile phones also have positive impact on customer satisfaction.

**RECENT TRENDS IN ECONOMICS, COMMERCE & MANAGEMENT:  
E-BUSINESS & CHALLENGES OF BUSINESS**

**Manjula D. Vyas**

*Assistant Professor, K. P. B. Hinduja College Of Commerce 315, New Charni Road Mumbai 400004*

**Introduction:** E- Business has introduced with the introduction of E- Commerce. E- Business controls the E-Commerce with the help of electronic power in which internet plays important role. It connects companies with the other companies as well as their customers. Customers are up to date with the company information and their progress. E- Business has given a single global platform to all businessperson. Those who have good knowledge of technology and are friendly with computer system, are successful in this global business platform and rest need to struggle for the same. Business includes buying and selling of product & services and E-Business includes use of Information and communication technology (ICT) which controls on external activities of the business.

**Objectives of the study**

1. To study the scope of E-Business
2. To highlight the benefits of E- business and challenges faced by businessperson

**Data Collection**

The study is based on secondary data collected from journal, articles published in journals and information available on relevant websites on internet.

**Review of Literature:** Dr. Bhakti Sharma researched on Benefits, Challenges and Proposed Solutions of e-Business in India and concluded that government and all public organisations should take initiative to train the businessperson to compete the global market.

Bhavya Malhotra (2014) researched on E-Business: Issues & Challenges in Indian Perspective and concluded that customer's faith need to be gain. He raises few challenges, which need to be focused such as return policy, mode of payment, payment gateways, mobile compatible, etc.

Rashem Dhillon and Sukhpreet Kaur (2012) reviewed paper on e-Business & CRM and concluded that CRM plays an important role in E-Business and small businesses needs to focused more on CRM implementation.

Dr. Arun Sukumar and Prof. David Edgar (2009) researched on E-Business, SMEs and Risks: Towards a Research Agenda and concluded that one should have knowledge of E-business risk before entering into it. Leadership risk was found to be highly involved in SME stakeholders, which makes the lower adoption of e-business by the businesspersons.

**Benefits:** Benefits of E-business categorized into two types i.e. benefits to businesspersons and benefits to customers. E-business has made possible for every businessperson to do trade and commerce all over the world. Now it is a single click job for businesspersons to sell their product and services. E- Business has made it possible to do business 24/7, means your business will never sleep. Customers are easily reachable from the all four corners of the world. E-business reduces the overall cost. Internet is the new salesmen who not only advertises the product to the globe at no extra cost with the help of computer system but also take the orders and payments online with no worries of bad debts from customers. It reduces the cost of marketing and overhead cost but on the other hand it increases the cost of internet and maintenance cost of computer system. Overhead cost includes factory cost, power & fuel, wages, direct fixed cost, inventory cost management etc. Those who have good knowledge of computer system and well equipped with the system can start his own business with minimum cost. Many

businesspersons have started their business from home itself. They just need warehouse to store their product. Service providers do not need such warehouse and hence they can start providing services from home itself, which lead to minimum cost to run their business. They can provide their services to entire world at minimum cost, as they do not have to suffer other business cost except internet and computer system cost. The major expense is cost of maintaining online store. Now a days customers prefer online shopping and save their time in travelling to visit shop and many online shopkeepers provide gift vouchers, discount coupons which offline store do not provide. Online storekeepers also give quick delivery along with cash on delivery option, which makes it possible for customer to make payment on receiving the product at their doorstep. Online business attracts more customers compare to offline business. People search their requirement online with the help of search engine for example Google, Yahoo, etc. and the most popular product comes first in the list, which customer buy more. Due to heavy competition in the market, customers get more benefit of discount. Seller gives more gift vouchers, coupon codes, etc. to attract new customers. Hence, customers are more attracted to online shopping compare to offline shopping. It saves customers lot of time and money.

**Challenges:** We have seen the benefits of E-Business where we found that now a day customers are shifting from offline shopping to online shopping as it gives more benefits. New generation is more attracted to online shopping. Seller needs to face many challenges, which includes risk of security, risk of virus, risk of data stolen, etc. Those who are illiterate are out of the competition due to lack of computer knowledge and resistant to adopt change. Customer avoids online shopping in case of clothing and luxury items because they would like to touch/feel the same before buying it. Buyer- Seller relationship also makes it difficult for online shopkeepers to sell their product because offline seller builds a good repo with customers who do not let go their customer for online shopping. Internet is the core lifeline of E-Business and if that do not work one day that means that day online business will be in trouble. E-Business is fully dependent on internet and computer system. Computer system needs to be protected from viruses, which may destroy the entire data in a single second time. The biggest challenge in front of every businessperson is the knowledge of computer system and awareness of online market. Customers are afraid of making online payment because of credit card frauds around the world. Customers' data are captured by the computers and sellable in the market, which they may not will to share. As a result, customers do not provide their confidential information online and hesitate to trade online. The biggest challenge for the businesspersons is to gain the trust of customers, which is already gained by the offline seller and difficult to break. New trend of customers are using mobile devices more compare to computer and laptops. So making online shopping available on mobile device is little difficult and complex because customer uses different version of mobiles and hence, online store should be compatible to all such different mobile devices. Security issue gives online shopping at high risk. Online shopping requires use of internet, which allows viruses to enter mobile devices and corrupt the mobile data. For the businesspersons who do not have sufficient knowledge of online business, need to hire the employee to run the business. There are the chances that due to lack of knowledge of owner, there employee may ditch the owners. Initially it is a painful work to shift from offline to online market. It takes time to adjust and grow and to earn profit. Minimum two months require settling the online business and when one can live these two months, can run the online business later on smoothly. Online business requires an online store. Here online store means creating a website, which need to be hosted on secured server. Hosting is an important decision as all the customer data should be safe and secured. Website should reveal all the information of your business, product and services. Top online sellers are shopify, amazon, flipkart, snapdeal, eBay, paytm, shopclues, jabong, homeshop18, myntra, rediffshopping, etc.

**Conclusion:** E-Business is a part & parcel of E-Commerce, which includes not only selling the product and services but also maintaining customer relationship and overall business online with the help of internet. Company coordinate with their employees, executives, suppliers, business partners through internet-based technology. Customer relationship has given more priority and its management plays an important role. Businessperson lack computer knowledge and make them to hire computer expert personnel. Government need to take initiative to educate illiterate businesspersons and need to be given knowledge about the risk associated with the same.

## **GROWTH AND DEVELOPMENT OF E-BANKING SERVICES**

**Mrs. Meena Dushman-Khodade**

*Research Scholar, Department Of Commerce, S.N.D.T. Women's University Pune 411038*

**INTRODUCTION:** The process of globalization and liberalization has virtually transformed the way of business across the globe. The outcome of LPG reforms on the banking sector in India rising competition amongst various banks namely Public sector, Private Sector and Foreign Banks. There was increasing number of banks and new private sector banks entered with innovative technology as a result better products and services was offered to customers. In order to survive the intense competition every commercial banks needed to offer a range of their products along with good customer services. To meet the new challenges of the banking sector, all banks started adopting use of ICT (Information and Communication Technology) in banking operations so, the banks introduced electronically delivery of banking services and it became ideal way for banks to meet their customers' expectations. The Government of India and the Reserve Bank of India has been making concerted efforts to promote financial inclusion as one of the important national objectives of the country. E-banking will play a major role in achieving Financial Inclusion. Due to demonetization peoples are moving towards cashless transactions it means uses of e-banking services will increased day by day. So, Today E-Banking has experienced a phenomenal growth and has become one of the main avenues for the Indian banks to deliver their products and services The present study aims to study growth and development of E-Banking Services.

### **OBJECTIVES**

1. To study the Growth And Development of E-Banking Services
2. To study recent developments in E-Banking services.

**RESEARCH METHODOLOGY:** The relevant information have been collected from the present study is based on secondary sources comprises of published reports of RBI Bulletin, IBA Bulletin, Report on Trend and Progress of Banking in India, BSR(Basic Statistical Returns), various reputed journals, Magazines, unpublished reports, Books, Financial Newspapers, The information also borrowed from the related websites and other banking industry agencies.

**E-BANKING:** Electronic banking or E-banking is a web-based service that enables bank customers to access their account. It allows the customers to on to the bank's website with the help of a bank-issued identification and a personal identification number. The banking system verifies the user and provides access to the requested services. The range of products and services offered by each bank differs widely in their content. Though most banks offers e-banking as a value added service, E-banking has also led to the emergence of a new type of banks called "Virtual Banks" which operate through the internet. The most significant benefit of e-banking is the ready accessibility of bank accounts at all times. The inconvenience of visiting and waiting at the banks is also eliminated, which results in, enhanced customer satisfaction, reduced customer attrition and increased customer base. From the banker's side, E-banking considerably reduces transaction costs for the banks. The concepts of E-banking and Internet banking are used as synonymous in the banking industry, though in reality banking activities carried out through the internet just constitute a part of the whole gamut of E-Banking.

### **SERVICES COVERED UNDER E-BANKING**

E-Banking has numerous benefits to offer. Nowadays, all banks provide online banking facility to their customers as an additional advantage. Gone are the days, when one has to transact with a bank which

was only in his local limits. Online banking has opened the doors for all customers, to operate beyond boundaries. The popular services covered under E-banking include:-

- Automated Teller Machine (ATM)
- Electronic Funds Transfer (EFT) System
- Cheque Truncation Payment System
- Core Banking
- Debit Cards
- Credit Cards
- Smart Cards
- Telephone Banking (Tele-banking)
- Internet Banking
- Mobile Banking (M-Banking)
- Mobile Wallets

**GROWTH AND DEVELOPMENT OF E-BANKING SERVICES:** E-Banking system is not only popular nationally but also internationally where a person can transfer money through any part of the world. E-banking services which are more convenient to customers and cost effective to the banks. E-banking gives many benefits especially for the customers who are using the services. It allows the customer to manage their banking operations either from home, workplace or from just about anywhere in the world. Further, it provides flexibility, less time consuming, and there ease of use thereby offering efficiency in the banking transactions. These services we can use during or after the conventional banking hours i.e. it is offering 24 hours services for e.g. ATM Services, SMS banking, and net banking. Through e-banking all the banking activities become easier, convenient to customers as well as banking sector. So, it has helped the banks to increase customer satisfaction, decrease operation cost and provide good services to customers.

**Table 1 - Annual Growth of E-Banking Services**

Sr. No.	Services	Volume (million)				Value (Rs. billion)			
		2013-14	2014-15	2015-16	2016-17	2013-14	2014-15	2015-16	2016-17
1	No. of ATMs (in actual)	160055	189279	212061	222475	-	-	-	
2	NEFT	661.0	927.6	1252.9	1,622.1	43,786	59,804	83273	120,040
3	RTGS	81.1	92.8	98.3	107.8	734,252	754,032	824,578	981,904
4	IMPS	15.4	78.4	220.8	506.7	96	582	1622	4,116
5	Credit Cards	509.1	615.1	785.7	1,087.1	1540	1899	2407	3,284
6	Debit Cards	619.1	808.1	1,173.5	2,399.3	955	1,213	1,589	3,299
7	Mobile Banking	10.74	19.67	49.48	151	33.91	168.85	572.80	224
8	M-Wallets	14.07	46.11	53.44	307.45	3.99	10.82	23.79	73.12

Source: Report on Trends and Progress of Banking in India 2013, 2014, 2015, 2016, 2017

- Automated Teller Machine (ATM):** The most widely used E-Banking instrument is the ATM (Automated Teller Machine). The ATM card is the best and foremost innovative product in the banking system. The introduction of ATM in banks has transformed banking by providing banking services anytime, anywhere and any bank to the customer. Entry of ATMs has changed the profile of front offices in bank branches, now customers no longer need to visit branches for their day transactions such as cash deposits, withdrawals, cheque collection, balance enquiry etc. Growth in ATMs The geographic reach of ATMs increased further as the number of ATMs installed increased

to around 0.2 million as at end March 2016, an increase of 9.7 per cent over the previous year. PSBs maintained more than a 70 per cent share in the total number of ATMs. FBs, however, continued to post a decline in the number of ATMs. Distribution of ATMs Regional distribution of ATMs became more balanced with the share of metropolitan, urban and semi-urban centers in total installed ATMs varying between 26.0 per cent and 29.0 per cent. However, metropolitan centers witnessed a marginal decline in the share of ATMs to 26.9 per cent in March 2016 from 27.7 per cent during the previous year. Semi-urban and urban centers registered a marginal increase in their share of ATMs. (Table 1)

2. **Electronic Fund Transfer:** Today, electronic funds transfer allows you to exchange funds between individuals as well as organizations via electronic gateways which can be accessed using internet, computers and smart phones. Funds can be transferred instantly from one account to another, either within the same bank or to a different bank network at any given time. Today, the Electronic Fund Transfer has brought sea change in the nature of transactions of business entries. It has largely contributed to the success of the modern banking.

#### **Process of transferring funds**

Transferring funds via electronic gateway is much simpler than the conventional methods. You can choose to:-

- Transfer funds into your own linked accounts of the same bank network.
- Transfer funds into different account of the same bank.
- Transfer funds into different bank's accounts using NEFT.
- Transfer funds into other bank accounts using RTGS
- Transfer funds into various accounts using IMPS.

#### **Various modes of electronic fund transfers in India**

- NEFT or National Electronics Funds Transfer
- RTGS or Real Time Gross Settlement
- IMPS or Immediate Payment Service.
- **National Electronics Funds Transfer ( NEFT):** The National Electronic Funds Transfer is a nation-wide money transfer system which allows customers with the facility to electronically transfer funds from their respective bank accounts to any other account of the same bank or of any other bank network. Not just individuals but also firms and corporate organizations may use the NEFT system to transfer funds to and fro. Funds transfer through NEFT requires a transferring bank and a destination bank. With the RBI organizing the records of all the bank branches at a centralized database, almost all the banks are enabled to carry out an NEFT transaction. Any sum of money can be transferred using the NEFT system with a maximum cap of Rs. 10, 00, 000. During 2013-14, NEFT handled 661 million transactions valued at around Rs.44 trillion. In March 2014, NEFT processed a record volume of 82.8 million Transactions. NEFT handled 1.6 billion transactions valued at around Rs.120 trillion, up from around 1.3 million transactions for Rs.83 trillion in the previous year. As on April 30, 2014, the NEFT facility was available at 111,619 branches of 158 banks. At end-March 2016 the national electronic funds transfer (NEFT) facility was available through 130,013 branches of 172 banks, in addition to business correspondent (BC) outlets. (Table 1)
- **Real Time Gross System (RTGS):** Real Time Gross Settlement as the name suggests is a real time funds transfer system which facilitates you to transfer funds from one bank to another in real time

or on a gross basis. The transaction isn't put on a waiting list and cleared out instantly. RTGS payment gateway, maintained by the Reserve Bank of India makes transactions between banks electronically. The transferred amount is instantly deducted from the account of one banks and credited to the other bank's account. Users such as individuals, companies or firms can transfer large sums using the RTGS system. The minimum value that can be transferred using RTGS is Rs. 2 Lakhs and above. However there is no upper cap on the amount that can be transacted. During 2013-14, the RTGS processed around 81 million transactions valued at Rs.734 trillion. The system settled a record number of 0.48 million transactions on March 28, 2014. RTGS handled 108 million transactions valued at around Rs. 982 trillion in 2016-17, up from 98 million transactions valued at Rs. 825 trillion in the previous year (Table 1). As on April 30, 2014 the number of RTGS enabled bank branches stood at 109,506. The new RTGS system was launched on October 19, 2013. At the end of March 2017, the RTGS facility was available through 198 banks. Globally, it is for the first time that the ISO 20022 message formats are being used for transmitting RTGS messages.

- **Immediate Payment Service (IMPS):** Majority of the funds transferred using electronic channels are processed via NEFT or RTGS. But as the funds could only be cleared in batches using these transfer gateways, the National Payments Corporation of India introduced a pilot mobile payment project also known as the Immediate Payment Service (IMPS). Available to Indian public, IMPS offers instant electronic transfer service using mobile phones. IMPS interbank transfer service is available 24X7 and allows you to use your mobile phones to access your account and to authorize transfer of funds between accounts and banks. The IMPS service also features a secure transfer gateway and an immediate confirmation on fulfilled orders. IMPS is offered on all the cellular devices via Mobile Banking or through SMS facility. Thus IMPS enables customers to use mobile instruments as an instant money transfer gateway, facilitating user convenience and saving time and effort involved in other modes of transfer. During 2013-14, the IMPS processed around 15.4 million transactions valued at Rs. 96 trillion and it tremendously increased in the year 2016-17 around 507 million transactions valued at Rs.4,116 trillion. (Table 1)

**The differences:** There is no cap on the minimum value that can be transacted via NEFT. RTGS system however only process transactions of a value starting from Rs. 2 Lakhs and above as it caters to gross settlements. While the NEFT system settles transactions in batches, RTGS option transfer funds in real time. Using NEFT if a transfer order is received after the defined cut-off time, the transaction will have to wait until the next clearance to be fulfilled whereas RTGS transactions are processed continuously throughout the RTGS business hours.

IMPS stands out as the most convenient and instant mode of money transfer, allowing transfer of money across various accounts and banks on the go using a mobile device.

1. **Credit Cards:** The customer need not carry any cash and is empowered to spend wherever and whenever he wants with his credit card within the fixed limits prescribed by his bank. A credit card is a payment card issued to users (cardholders) to enable the cardholder to pay a merchant for any purchases based on the cardholder's promise to the card issuer to pay them for the amounts so paid plus other agreed charges. The card issuer (usually a bank) creates a revolving account and grants a line of credit to the cardholder, from which the cardholder can borrow money for payment to a seller or as a cash advance. Credit cards registered increased growth of 16.1 per cent during the year as against 10.1 per cent during 2014-15. Bank group-wise; PSBs maintained a strong lead in issuance of debit cards with a share of 82.8 per cent. On the other hand, PVBs had a dominant position in credit card issuances with a share of 60.1 per cent. During 2013-14, 509 million transactions valued at Rs.1,539 billion were transacted through credit cards. During 2015-16, 786

million transactions valued at around Rs.2.4 trillion were carried out through credit cards. During 2016-17, 1.1 billion transactions, valued at around Rs.3.3 trillion were carried out through credit cards. (Table 1)

2. **Debit Cards:** A debit card (also known as a bank card or check card) is a plastic payment card that can be used instead of cash when making purchases. It is similar to a credit card but unlike a credit card, the money comes directly from the user's bank account when performing a transaction. During 2014- 15, the spurt in debit card growth was attributed to the Pradhan Mantri Jan Dhan Yojana (PMJDY) under which every account holder under the scheme was issued a RuPay debit card. As the growth in account opening under PMJDY decelerated, this resulted in a decline in the growth of debit card issuances. Debit cards Growth in the number of outstanding debit cards decelerated sharply to 19.6 per cent in 2015-16 from 40.3 per cent in the previous year. During 2013-14, 619 million transactions valued at Rs. 954 billion were undertaken through debit cards. During 2015-16, 1.2 billion transactions valued at Rs 1.6 trillion and in the year 2016-17 2.4 billion transactions valued at Rs 3.3 trillion were carried out through debit cards (Table 1)
3. **Internet Banking:** Banks design their internet banking portal by integrating a number of services that you can access anytime, anywhere. Moreover, special emphasis is laid on the user-friendliness of the interface, ease of navigation and the processing speed of requests when an online banking portal is being designed. This approach makes internet banking a very convenient mode of banking for customers. All the branches are interconnected with the help of satellite.

#### **Services available through Internet Banking**

- Managing your Bank Account, Fund Transfers, Paying Bills
  - Make online purchases, book tickets for movies and Buy air or train tickets online.
  - Request for Cheque books and demand drafts. You can also put stop cheque requests in case there are insufficient funds in your account.
  - Initiate requests for opening or closing a Recurring Deposit or a Fixed Deposit as well as keeping up to date about these deposits.
  - In case you have taken a loan from the Bank where you have Internet banking access, you may also get a dedicated tab for checking your loan details.
  - On similar lines, Banks also have separate tabs that provide information about any investment products that you have with them.
4. **Mobile Banking (M-Banking):** Everyone shows interest in adopting a new technology when it is launched. Mobile Banking is a service provided by a bank that allows customers to conduct financial transactions using mobile device. It uses software, usually called an app, provided by the bank. Mobile banking is also known as M-banking. M-banking is usually available on a 24-hour basis. M-banking is simply application of mobile phone dives as a mean of banking via Wireless Application Protocol(WAP), GPRS and 2G,3G,4G technology and short message services (SMS) facilities. Most of the customers found mobile banking to be more user-friendly as it provides enhanced and extensive range of service at reduced costs. The rapid growths in users and wider coverage of mobile phone networks, this channel have made an important platform for extending banking services to customers. During the year, 2013-14, mobile banking services handled 95 million transactions valued at around Rs.60 billion. During 2015-16, Mobile banking service growth surged by 126.6 per cent in terms of volume and 290.3 per cent In terms of value handling 389 million transactions valued at Rs. 4 trillion. This Mobile Banking service witnessed strong growth of 151per cent and 224 per cent in

volume and value terms, respectively while the number of registered customers rose to 163 million at the end of march 2017 from 105 million at the end of march 2016. (Table 1)

**7. Core Banking:** Core Banking is all about knowing customer's needs & providing them with the right products at the right time through the right channels 24 hours a day, 7 days week (24x7). In other words, Core Banking refers to the activities a bank generally undertakes. It included Core Banking process which refers to the complete administration of transactions for the bank through a central data base. In an ideal Core Banking scenario, all products, processes, channels and customer relationship management tools are the integrated and administrated through a central data base of the bank with branches and channels as a delivery points.

8. **Tele Banking:** It is increasingly used as a modern E-Banking service by the banks. A customer can do online non-cash related banking over the phone anywhere at any time. Automated Voice Recorders (AVR) or 10 numbers are used for rendering Tele-Banking services which have added convenience to the customers.

9. **Mobile Wallets:** A virtual wallet that stores payment card information on a mobile device. Mobile wallets provide a convenient way for a user to make in-store payments and can be used at merchants listed with the mobile wallet service provider. The mobile wallet is an app that would need to be installed or a feature that is already in-built with the smartphone. Think of a mobile wallet like a storage container that stores your credit cards, debit cards, coupons and reward cards. Once the app is installed and the user inputs his payment information, the wallet stores this information by linking a personal identification format like a number or key, QR code or an image of the owner to each card that is stored. When a user makes a payment at a merchant, the mobile app uses a technology called Near-Field Communication (NFC) which uses radio frequencies to communicate between devices. NFC uses the personal identification format created for the user to communicate the payment information to the merchant's POS (Point-of-Service) terminal. The information transfer is usually triggered when the user waves or holds his NFC-enabled mobile device over the store's NFC reader.

During the year, 2013-14, mobile wallets services handled 14.07 million transactions valued at around Rs.3.99 billion and the uses of this service increasing day by day and during the year, 2016-17, mobile wallets services handled 307.45 million transactions valued at around Rs.73.12 billion.

#### **Some Recent Developments in Banking Services**

1. Various payment products and interfaces are now available – Internet banking, cards, mobile banking, ATMs and micro ATMs, prepaid payment instruments including e-wallets and m-wallets.
2. Remittance facilities through National Electronic Funds Transfer system (NEFT), Real Time Gross Settlement system (RTGS), Immediate Payment System (IMPS), Instant Money Transfer (IMT), etc., most of which can be accessed through multiple channels including net banking, mobile banking, ATMs and Business Correspondents.
3. Leveraging on the high mobile density in the country, mobile banking services are being encouraged through interoperable USSD channel like \*99# and the Unified Payments Interface (UPI) provided by National Payments Corporation of India (NPCI). I am especially enthused by UPI, as smart phones become more widely available. Transfers from bank account to bank account will become easier in a few weeks via smartphone through the Unified Payment Interface. A villager needing to pay a shopkeeper only needs to know the latter's alias – say Ram@xyzbank.psp. He feeds that into his mobile app, writes the payment amount, puts in his

password, and presses 'send' and the payment is made, with both getting messages to that effect. Neither needs to visit the bank to take out or deposit money, no point of sale machine is needed. With the price of smartphones falling sharply, we are on the verge of solving the last mile problem.

4. Government direct benefit payments are being made through Aadhaar linked payment systems like Aadhaar Payment Bridge System (APBS) and Aadhaar Enabled Payment System (AEPS).
5. Bulk and repetitive payments of corporate and governments can be processed through centralized system of National Automated Clearing House (NACH) to which the decentralized system of Electronic Clearing Service (ECS) is also being migrated.
6. NPCI was given to go live for UPI during the year 2016-17. Further NPCI was allowed to launch BHIM (Bharat Interface for Money) which is common app with some functionalities, thus providing an additional interface to customers to connect to UPI besides banks own apps.

**CONCLUSION:** Introduction and /or Development of Information Technology have not only affected the banking system of our country but the entire banking system of the world. Information Technology offers enormous potential and emancipated various opportunities to the banking sector. It provides cost effective, rapid and systematic provision of service to customers. Applications of IT in banks enables sophisticated product development, reliable techniques for risk management, brings transparency to the system and helps banking sector reach geographically distant and diversified markets. Information Technology has positive effect on the efficiency of banking industry in India. E-banking offers a higher level of convenience for managing one's finances even from one's home. E-banking system is useful for the bankers as well as customers of banks. ATM, NEFT, RTGS, IMPS, Internet Banking, Mobile Banking, Mobile Wallets Etc. have revolutionized the banking sector by providing easy, convenient and quick services to the customers. Thus, E-Banking services is not only popular nationally but also internationally where a person can transfer money through any part of the world as well as E-Banking services is one of the medium to achieve Financial Inclusion objective and to increase cashless transactions. So, this study concludes that uses of E-Banking services increasing day by day and its gaining momentum for making digital India

## **DEMONETIZATION OF CURRENCY**

**Prof. Dr. A. M. Pawar**

Associate professor, Hutatma Rajguru mahavidyalaya, Rajgurunagar Dist-Pune

**Introduction:-** The importance of human resource development (H R D) is now being increasingly realised in the country in general & particularly in the fast growing corporate world as a result of globalization and new economic policies. Today, the concept HRD is considered seriously by most of the medium & large scale industrial organizations, so as to keep the organizations competent & forward-looking. HRD aims at the promotion of the well being of individuals, families & societies. It deals with creating conditions that enable people to get the best out of themselves & their lives. Development is a never ending process. As people develop themselves, new problems & issues arise & the growth-development-problem loop continues. Leonard Nadler who first coined the word HRD, along with G.D. Wiggs, says that development is concerned with providing learning experiences to employees so that they may be ready to move into new directions that organizational change may require. HRD is recognized as an important tool for corporate strategy, integrating conceptual values with human values.

**1. HRD AT THE ORGANIZATIONAL LEVEL:-** At the organizational level the goal of HRD is normally to have competent & motivated people i.e. employees to ensure higher levels of productivity, profitability and growth of the organization. An organization uses many mechanisms to achieve HRD goals since without competent & committed employees, organizations can achieve very little even if they have excellent technological & other resource bases. People are the real assets of an organization. Organizations depend on people for their survival & growth. HRD is a positive concept in Human Resource Management (HRM). It is based on the belief that an investment in human beings is necessary & will invariably bring in substantial benefits to the organization in the long run. It aims at overall development of human resources in order to contribute to the well-being of the employees, organization & the society at large. HRD is a concept which represents the latest evolutionary stage in the long tradition of training, educating & developing people for the purpose of contributing towards the achievement of individual, organizational & social objectives. HRM & HRD have both attracted a certain amount of criticism for its 'incentive depiction' of people as replacement parts serving the mechanistic requirements of the organization. HRD & HRM have made individuals feel that organizations can use them, interchange them & dispense them at will. However, we should consider how HRD contributes to strategic issues & how various elements of an organization interrelate with HRM. The roles & practical competencies required of those involved in HRD must be given due consideration.

**2. THE CONCEPT OF HRD AND ITS DIMENSIONS:-** People make things happen. If people have to make things happen, they need a set of 'circumstances' to make them happen. However, it is the people who create 'circumstances' that can help themselves & others to make things happen. According to T.V. Rao, "HRD is the process of competency development in people & the creation of conditions to help people apply these competencies for their own benefit & for that of others." HRD is a continuous process. While the ultimate objective of HRD is to develop competencies in individuals & groups developing competencies is a never-ending process. As one level of competencies is developed in an individual or a group another set of needs may arise requiring the development of another set of competencies.

HRD is rooted in the belief that human beings have potential. It places a

premium on the dignity and tremendous latent energy of the people. According to T V Rao HRD is the process of helping people acquire competencies. In an organizational context HRD is a process by which the employees of an organization are helped in a continuous & planned way to:

- \* Acquire or sharpen capabilities required to perform various functions associated with their present or expected future roles.

- \* Develop their general capabilities as individuals & discover & exploit their inner potential for their own and/or organizational development purposes.

- \* Develop an organizational culture in which supervisor-subordinate relationships team work & collaboration among sub-units are strong & contribute to the professional well-being motivation & pride of employees.

The HRD process is facilitated by mechanisms like-

- \* Performance appraisal
- \* Training
- \* Organizational Development (OD)
- \* Feedback and Counseling
- \* Career development
- \* Job rotation
- \* Rewards

### **3. Why HRD?**

People need competencies to perform tasks higher degree & quality of performance of tasks requires a higher level of skills. Without continuous development of competencies in people an organization is not likely to achieve its goals. Competent & motivated employees are essential for organizational survival growth & excellence. Over a period of time an organization may achieve a saturation point in terms of growth. Even to maintain such a saturation level of growth & for organizations to operate in environments that keep changing employee competencies need to be sharpened or developed. Any organization that is interested in improving its services and its effectiveness in other ways needs to develop its employee's competencies to perform the tasks required to bring about such improvements. Thus HRD is needed to every organization that is interested in- Stabilizing itself, Growth, Diversifying, Renewing itself & to become more effective. Improving its system & services, Change & becoming more dynamic & playing leadership roles.

**4. HRD Mechanisms, Processes and Outcomes:-** HRD should therefore be a continuous process in organizations. The nature of efforts & investments put into developing human resources may vary from organization to organization depending on its need nature and size. This may also vary from time to time in the same organization depending on the nature of change that the organization is going through or the nature of capabilities that the organization wants to build within it. There are many methods or instruments available for organizations to develop employee competencies. The instruments of HRD are many. The HRD instruments should lead to the generation of HRD processes like role clarity performance planning development climate risk-taking & dynamism in employees. Such HRD process should result in more competent satisfied & committed people that would make the organization grow by contributing their best to it. Such HRD outcomes influence the organizational effectiveness.

### **5. The Characteristics of HRD:-**

**i) HRD is a system:** - We must consider HRD as being made up of several mutually dependent parts or subsystems such as procurement development and performance appraisal. Change in any one subsystem leads to changes in other parts. There are feedback loops from one subsystem to another. As a result change in any one subsystem produces a reverberating effect on all other subsystems.

**ii) HRD is a planned process:** - HRD is a planned system of developing people. It is a lifelong process which goes on continuously.

**iii) HRD develops competencies at four levels:-**

a) At the individual level employees are made aware of their rules & what is expected of them, so that they are able to improve their skills & attitudes accordingly. By enriching & redesigning jobs the roles of employees are made more meaningful & interesting.

b) At the dynamic level stronger employer-employee relationships are developed by developing more trust mutuality & help. Thus at the interpersonal level more stress is laid on developing relationships based on trust confidence & help.

c) At the group level committees or task groups are made more effective by developing collaboration in their inter-group relationships.

d) At the organizational level development of competencies involves the development of self-renewing mechanisms in the organizations which enable it to adjust to the changes in its environment & to be proactive.

**iv) HRD is a continuous process:** - HRD being a process of development always goes on Organizations can facilitate the process of development by planning for it by allocating organizational resources for the purpose & by creating an HRD philosophy that values human beings & promotes their development.

v) The ultimate objective of HRD is to contribute to the professional well being motivation & pride of employees.

## **6. The Importance of HRD:-**

**i) HRD is needed to develop competencies:** - No organization can survive if its employees are not competent in terms of knowledge skills & attitudes. Both profit as well as non profit organizations need competent employees for the success of the internal & external operations.

**ii) HRD is needed to mitigate some of the evil consequences of industrialization:** - It is common knowledge that the factory system has dehumanized & deskilled various jobs. By enriching worker's roles HRD satisfies their needs of advancement growth self respect recognition creativity & autonomy. HRD enables employees to lead an integrated life which is mostly partitioned by the factory system into two lives-the organizational life and the personal life.

**iii) HRD is needed to bring about system-wide changes:** - While traditional HRM system like training job rotation and so on has their relevance & use they are by themselves inadequate to bring about the kind of system-wide change that is visualized in the concept of HRD. The newer concept HRD & its programmes on the other hand bring about a system-wide change. They gradually enrich the entire socio-technical system.

**iv) HRD is needed to develop a proper climate in the organization:** - Executives in most traditional organizations seem to hold the following values-

- \* Getting the job done
- \* Being rational & logical rather than emotional
- \* Effectively motivating human relationships with appropriate rewards & penalties

The above values lead to the following consequences:-

- \* Executives remain unaware of human problems
- \* Decision-making becomes less effective

HRD develops a new climate in the organization. It replaces the old values by new ones people become more open independent authentic creative and collaborative in their behavior.

**7. HRD Methods or Mechanisms:-** Any systematic or formal way of developing the competencies & motivation of individuals in an organization & building the organization's climate by improving the above processes can be called an HRD method. Many HRD mechanisms are available to develop the competencies of employees & improve the overall organizational climate.

The most frequently used methods are as follows:-

**i) Manpower Planning:** - Manpower planning is the sheet anchor of all HRD efforts. It is concerned with the following:-

**a) Assessment of manpower needs**

**b) Manpower audit**

Thus manpower planning is linked with corporate plans & strategies on the one hand & job analysis on the other hand.

**ii) Performance Appraisal and Feedback:-** Performance appraisal have become an increasingly important tool for the organization to use in managing & improving the performance of employees as well as in making timely & accurate staffing decisions. The appraisal process is a formal way of evaluating an employee's performance. Appraisal helps an organization communicate its expectations regarding performance & the connection between performance & rewards to employees. They increase employee's confidence when employees receive feedback that their efforts are being adequately rewarded. The feedback is offered through an evaluation interview.

**iii) Training Education and Interview:** - Training has gained importance in present-day environment where jobs are complex & change rapidly Training is a learning experience designed to achieve a relatively permanent change an individual that will improve the ability to perform on the job.

**iv) Potential Appraisal:-** The term 'potential' refers to the abilities possessed by an employee but not put to use currently or the abilities to assume challenging responsibilities in future assignments. Potential appraisal is different from performance appraisal which shows an employee's current performance in his existing role. The objective of the potential appraisal is to identify the potential of the given employee to occupy higher positions in the organizational hierarchy & undertake higher responsibilities. Potential appraisal is carried out on the basis of (a) supervisor's observation's (b) performance data relating to various previous roles played by an employee; and (c) performance on roles in simulated settings related to a new position. A good potential appraisal system helps management pick up a suitable candidate for a given job & prepare him to carry out the function in the new job.

**v) Career Development and Career Planning:** - A career is a sequence of positions held by a person in the course of a lifetime. Career planning is a process of integrating the employee's needs & aspirations with organizational needs. In HRD systems corporate growth plans are not keep secret. They are made known to the employees to plan their career. It is useful to new employees as it makes them aware of their specific career path.

**vi) Compensation and Reward:** - Compensation & reward should be clearly related to performance & behavior of employees. While salary structure under HRD is based on job analysis salary increase is linked with performance Compensation & rewards are common positive reinforcements which should be clearly related to the performance & behavior of employees.

**vii) OD Techniques:** - Organizations' are never perfectly static. They keep on changing Employee's skills & abilities therefore require continuous upgrading. The future is uncertain & full of surprises. It is not easy to fight the forces of change without adequate preparation & training. A systematic & planned way of managing this change is through the process of OD techniques includes team-building organizational mirroring & T-group.

**viii) Role Analysis and Role Development:** - Under this the job of an individual in the organization is analyzed & enriched in terms of his role & not in terms of his job. It is always ensured that a role is sufficiently challenging for the individual provides him adequate autonomy for taking initiatives & is linked with other organizational roles to avoid a feeling of isolation.

**ix) Quality of Work Life and Welfare:** - The term 'employee welfare' means 'the effort to make life worth living for workmen'. It includes various services facilities & benefits offered to employees by the employers & government. Quality of work Life (QWL) are systematic efforts by organizations to give workers a greater opportunity to affect the way they do their jobs & the contributions they make to the organization's overall effectiveness. In an HRD system there is always a focus on employee welfare & quality of work life. Employees must not only be given good wages they should also be provided with good physical conditions & motivating work.

**x) Industrial Relations:** - Good industrial relations based on mutual trust & goodwill make the execution of HRD programmes easier. In HRD unions are encouraged so as to look after the psychological & social well-being of workers. The important areas in which unions can participate are:

# Unions can pass on greater & more varied information to workers about themselves & the organization

# Unions can play very positive roles in providing counseling services to employees

# Unions can play a development role in the education of workers

# Union can help management in developing innovative welfare schemes for employees such as worker's co-operatives worker's banks & nursery schools

# Unions can help workers families in several ways:

- They can provide guidance with respect to education.

- They can provide conciliation services in settling family quarrels.

- They can help in creating jobs for the wives of workers.

**8. Outcomes of HRD:-** Each of the subsystems described above contribute to the achievement of overall HRD goals. Potential appraisal focuses on identifying the employee's future role in the organization. Organization development aims at developing team spirit & self-renewing skills. The contributions of these HRD subsystems result in certain HRD outcomes which are given below-

\* People in organizations become more competent because they become better aware of the skills required for job performance.

\* People understand their roles better because of increased communication.

\* People become more committed to their jobs because now there is greater objectivity to their jobs as also in the administration of rewards.

\* People develop greater trust & respect for each other.

\* There is greater collaboration & teamwork which produces a synergy effect.

\* People find themselves better equipped with problem-solving capabilities. There is greater readiness on their part to accept change.

\* A lot of useful & objective data on employees is generated which facilitates better human resource planning.

\* The top management becomes more sensitive to employee's problems & human processes due to increased openness in communication.

**CONCLUSION:-** HRD has almost become a fad since the latter part of the last decade and still continues. In the present context in the wake of rapid technological changes a fierce by competitive market has emerged in the liberalized era and employees are being perceived as important 'Assets'. There is an increasing awareness that employees too undergo value addition that they are important in

giving quality products. Hence the current situation has given the needed fillip for the widespread promotion of the concept of HRD.

## INDIA'S DEMONETIZATION

**Dr.S.T.Kute**

*Smt. Sindhutai Jadhao Arts and Science, College Mehkaer*

**DEFINITION of 'Demonetization:** “Demonetization is the act of stripping a currency unit of its status as legal tender. It occurs whenever there is a change of national currency: The current form or forms of money is pulled from circulation and retired, often to be replaced with new notes or coins. Sometimes, a country completely replaces the old currency with new currency.”

**Historical Case: Demonetization of the Indian Rupee in 2016:** The demonetization of the Indian Rupee in 2016 is a kind of political-economic experiment. John Lanchester wrote: “Two months ago, the world’s largest democracy embarked on one of the biggest monetary experiments the world has ever seen. On Nov. 8, without warning or preamble, without discussion papers or leaks, Narendra Modi’s Indian government invalidated most of the country’s cash. The 500- and 1000-rupee notes ... were, as of that moment, no longer legal tender. Anyone in possession of these notes had until Dec. 30 to take them to a bank and either deposit them or exchange them for other notes. Anyone presenting more than 250,000 rupees in cash (\$ 3700) had to provide an explanation for why he had so much, and proof that he had paid tax on it; the penalty for unpaid tax was to cough up 200 percent of the amount owed. The two retired notes represented 86 percent, by value, of all the cash in circulation in India” .

ShashiTharoor wrote: “On November 8, Indian Prime Minister Narendra Modi announced that, at the stroke of midnight, some 14 trillion rupees worth of 500- and 1000-rupee notes—86% of all the currency in circulation—would no longer be legal tender. With that, India’s economy was plunged into chaos. Modi’s stated goal was to make good on his campaign pledge to fight ‘black money’: the illicit proceeds—often held as cash—of tax evasion, crime, and corruption. He also hoped to render worthless the counterfeit notes reportedly printed by Pakistan to fuel terrorism against India. Nearly a month later, however, all the demonetization drive has achieved is severe economic disruption” .

The significance of this event in India provides an empirical case to understand the role of money in a modern economy, not just in India’s economy. John Lanchester further wrote: “Many Westerners have become so used to discussing China as the most populous country in the world, with 1.357 billion inhabitants that they forget India is just behind it, with 1.252 billion. Of that total, only 12 million pay income tax. That’s an astonishing number: 99 percent of Indians don’t pay tax. The majority of Indians work in what economists call the ‘informal’ or ‘unorganized’ economy, which runs overwhelmingly on cash. The short-term result of Modi’s move has been, unsurprisingly, chaos: huge lines at A.T.M.s and banks, farmers unable to buy seeds to plant crops, weddings and property transactions canceled, piles of illicit cash shredded or burned. Some workers have been forced to choose between earning a day’s pay or spending the same day waiting to deposit money in a bank. Many of the poor don’t have bank accounts at all” .

The rupee currency is fiat currency, issued or withdrawn by a government. However, in formulating the policy to withdraw the fiat notes, the Prime Minister had not anticipated the impact upon the commodity money of India. ShashiTharoor wrote: “Far from being a masterstroke, Modi’s decision seems to have been a miscalculation of epic proportions. The announcement immediately triggered a mad scramble to unload the expiring banknotes. Though people have until the end of the year to deposit the notes in bank accounts, doing so in large quantities could expose them to high taxes and fines. So they rushed to gas pumps, to jewelry shops, and to creditors to repay loans. Long queues

snaked in, out, and around banks, foreign-exchange counters, and ATMs—anywhere where people might exchange the soon-to-be-defunct notes. But, upon getting to the front of the line, people were often met with strict withdrawal limits, because, in a display of shocking ineptitude, not enough new currency was printed prior to the announcement. Worse, the new notes' design prevents them from fitting into existing ATMs, and their denomination—2000 rupees—is too high to be useful for most people, especially given that the government's failure to print enough smaller-denomination notes means that few can make change". It is important to distinguish between the functions of money as fiat (taxes) and commodity (trade) because, in all cases, money is a kind of "ticket" to an activity, to a "performance". For example, John Maynard Keynes wrote: "Money is the measure of value, but to regard it as having value itself is a relic of the view that the value of money is regulated by the value of the substance of which it is made, and is like confusing a theatre ticket with the performance". The demonetization also impacted consumer prices. Geeta Anand and Hari Kumar wrote: "The decline in vegetable demand is so steep that the prices of eggplants, potatoes, cauliflower and tomatoes dropped between 42 percent and 78 percent (the NCDEX Institute of Commodity Markets and Research said). In the first month alone after the currency ban, micro and small-scale service industries cut staff by 35 percent (the All India Manufacturers' Organization said, based on a survey). It released a study this month saying that job losses in a variety of industries, including automobile parts, infrastructure and construction, would swell to as much as 35 percent by March. Most economists believe the economy will rebound, but nobody knows how long it will take". By the middle of March 2017, it became evident that Modi's political party (and India) would survive the economic crisis. On March 14, 2017, Amy Kazmin and Simon Munday wrote: "When Indian banks open today, the era of cash rationing that followed Narendra Modi's cancellation of most of the country's currency will have come to an end ... The severe liquidity squeeze has already eased. India's supply of legal tender in circulation has risen to \$ 158 bn, mostly in freshly printed Rs 500 and Rs 2000 notes ... 'A lot normality has already come into the market,' said Romesh Solti, chief executive of InsusInd Bank. 'You don't see queues for cash anywhere' ... However, private banks such as Axis Bank, HDFC and ICICI are still trying to damp the hunger for cash, with new fees on cash transactions ..."

#### **BREAKING DOWN 'Demonetization'**

There are multiple reasons why nations demonetize their local units of currency:

- to combat inflation
- to combat corruption and crime (counterfeiting, tax evasion)
- to discourage a cash-dependent economy
- to facilitate trade

**Dramatic Examples of Demonetization:** The Coinage Act of 1873 demonetized silver as the legal tender of the United States, in favor of fully adopting the gold standard. Several coins, including two-cent piece, three-cent piece, and half dime were discontinued. The withdrawal of silver from the economy resulted in a contraction of the money supply, which subsequently led to a five-year economic depression throughout the country. In response to the dire situation and pressure from farmers and silver miners and refiners, the Bland-Allison Act remonetized silver as legal tender in 1878. An example of demonetization for trade purposes occurred when the nations of the European Union officially began to use the euro as their everyday currencies in 2002. When the physical euro bills and coins were introduced, the old national currencies, such as the German mark, the French franc and the Italian lira were demonetized. However, these varied currencies remained convertible into Euros at fixed exchange rates for a while to assure a smooth transition.

**Alternative Funds:** Soon after the announcement, people rushed to buy gold, a demand that drove prices up, in some cases even to a 60% premium, prompting the tax authorities to conduct surveys, according to the Business Standard newspaper. The government emphasized the need to furnish PAN (Indian Permanent Account Number) card details on purchases for accountability purposes, and many jewelry shops that were flouting the norms came under crackdowns. Simultaneously, rumors of a gold ban started to float, which led to agencies ramping up the volume of gold imports – to around 100 metric tons during November, the highest since 2015, as reported by Reuters. Many Indians switched to alternative payment avenues – a big deal in a country of 1.2 billion with only 25.9 million credit cards and 697 million ATM cards as of July 2016. The biggest gainers were mobile wallet companies that offer ease of transactions through a large network of partners. Alibaba (NYSE:BABA)-backed Paytm saw a sevenfold increase in overall traffic and a 10-fold jump in money added to Paytm accounts. It also saw the number of transactions double to five million a day. App downloads for Paytm increased by 300%. Paytm rival MobiKwik also saw its app downloads quadruple and a 20-fold increase in money added to the wallets, MobiKwik Founder & CEO BipinPreet Singh, told CNBC-TV18 on November 13. Prepaid cash cards were another option that customers found useful, and that meant good news for companies like ItzCash. Other alternatives include mobile payments systems linked to e-commerce businesses like Ola Money, FreeCharge, Flipkart Wallet. Ola Money, the payment portal for popular transportation app Ola Cabs, reported a 1500% jump in money added to the accounts in less than four hours. Interest in Bitcoin also spiked: SandeepGeonka, co-founder of Zebpay, told Investopedia that his bitcoin exchange was now adding about 50,000 new users per month. "We are seeing an increased demand for bitcoin and India clearly has shortage of supply, making the demand and lack of liquidity push up prices of bitcoin as compared to global exchanges," said Coinsecure CEO MohitKalra. The virtual currency was trading at INR 55,735 in India in November (about \$836), compared INR 47,725 (about \$71).

**Long-Term Effects:** Over 3 trillion rupees, or over \$44 billion in old currency, was deposited with Indian banks in just the first week after the demonetization. There was concern that the uncertainty and short-term liquidity squeeze would take some momentum off the Indian economy, the fastest-growing in the world; in particular, sectors like real estate, notorious as a harbor for cash dealings and black money, were expected to take a hit, with "luxury property prices dipping by as much as 25-30%," said Ashwinder Raj Singh, CEO of Residential Services, JLL India. But experts believed any slowdown would only be short-lived once the systems adjusted to the new normal, especially if the government heeded calls to lower interest rates by groups like the Federation of Indian Chambers of Commerce and Industry (FICCI). Credit rating agency India Ratings & Research maintained its GDP growth forecast for India at 7.8% for FY17, albeit with a downward bias. The 2016-2017 economic event of a sudden demonetization in India can provide an empirical example in which to test the validity of some schools of monetary theory, particularly the Chartalist School. The Chartalist School distinguished three kinds of money: Fiat, Commodity, and Managed Money. The event provided empirical evidence that this distinction between currencies in an economy is valid and important. The sudden withdrawal of Fiat money immediately decreased the amount of commodity money, creating an economic crisis in local Indian commerce. Managed money, as bank accounts, was unable to fill the temporary gap in the supply of money because a large portion of the Indian population did not have bank accounts. Also the government did not supply a sufficient number of new 500 and 2000 rupee notes to quickly replace the withdrawn 500 and 1000 rupee notes.

**Introduction:** The training of entrepreneurs is a major concern for school teachers, entrepreneur's trainers, socio economic organizers, public administrators, and international development consultants. All these actors will one day have to face the following questions: Is the teaching institution closed or open to the milieu with regard to the definition, development, and evaluation of program content? What other social partners come within students' orbit? What skills and knowledge are needed to supervise training? What learning goals are being proposed? What place does the student have in the process? Is the goal to sensitize a given population to the phenomenon of entrepreneurship? Are efforts being directed towards the creation of new business enterprises or towards the development of existing businesses? All these questions arise when we are teaching entrepreneurship. Two expressions are typically used to describe entrepreneurship training programs: "entrepreneurship education" and "small business education." Let's see how these concepts can help us define our unit of analysis. "Entrepreneurship education," a concept frequently used in American and Canadian entrepreneurship journals, essentially conveys one of two meanings. It refers either to training programs devoted to helping future entrepreneurs start up their business (Vesper, 1982) or to education programs preparing for a career in entrepreneurship (Ronstadt, 1985). In Europe, the expression "small business education" is used to cover four kinds of programs:

- Entrepreneurship education (in the Schumpeterian sense of "carrying up a new combination of elements")
- Education for small business ownership and self employment (reproduction or acquisition of an existing enterprise)
- Continuing small business education (continuing education for owners of small businesses)
- Small business awareness education (education for a career in entrepreneurship)

It is frequent to see that the American and European definitions cut across several possible objectives. If we wish to analyze all the formally structured programs, we will need an expression that casts a wider net. A common definition has been agreed by three international organizations: the International Network of Management Development (INTERMAN), the United Nations Development Program (UNAP), and the International Labour Organization (ILO) in Geneva. The expression recommended for use by these three bodies is "entrepreneurship development program" (EDP), meaning any set of structured courses designed to inform, train, and educate those interested in participating in socio economic development through projects aimed at business awareness and creation or at the teacher training. It is this definition of an EDP that we shall use in our discussion.

**Major Questions in Entrepreneurship and Education:** We can now identify the various kinds of information (know what) needed to start up and manage a small business. But little is known about the intuition (know when); social skills (know whom); technical skills (know how); or attitudes, values, and motives (know why) which determine success. Our research suggests that course content is built more on the trainer's expertise than on the needs of learners, market opportunities, and the business project's stages of development. We observe that the teaching methods now used favor more observation and

theoretical thinking instead of problem solving and the implementation of corrective measures. Though we know the main clientele attending EDPs, little work has been done on the learning process of these different learners/entrepreneurs. In order to solve this problem, it would be useful to ask questions about the theoretical foundations of entrepreneurship development programs. It is reasonable to think that understanding the theoretical foundations of each program, leads to choose a methodology suited to their respective evaluation.

**An Exploratory Study:** These are the two questions we propose to answer in this section. What is the testing ground of the present research and what methodology will be used? But first, it would seem important to sketch a brief outline of the important contributions in the field of education. This will allow us to construct a theoretical framework.

**Introduction to Education:** The Latin etymology of the word "education" refers us to two meanings: "educare" means to nourish and "educate" means to lead forth, to rear. Today, this semantic duality has branched off in four directions. Education is constantly spoken of in terms of the school system, its pedagogical processes, its programs, and its products the educated. To clarify the multidimensional nature of the realities it covers, the concept of "education" thus requires the contributions of several sciences, each with its specific object and method. However, all the knowledge accumulated around the concept "education" is not of the same value. For Morin and Brunet, the educational sciences are defined mainly through the prism of practical knowledge of didactics; the experimental knowledge of psychology, biology, sociology, and history; and the met knowledge of philosophy. These six approaches

of knowledge give a very good picture of what education is all about (Table 1).

**Table 1**

**Foundations of Educational Sciences  
(Morin, Brunet, 1992)**

<b>Meta Knowledge</b>	<b>Philosophy of education</b>
<b>Universal Knowledge</b>	
<b>Experimental Knowledge</b>	<b>Biology of education Psychology of education Sociology of education History of education</b>
<b>Practical Knowledge</b>	<b>Didactics</b>

Didactics, the teaching and learning practices used to attain educative intentions, have evolved greatly over the centuries. Early methods were purely imitative. Then, as schools became institutions, there was the development of pedagogy for the child which finally led to an andragogy for adults. For its part, the sociology of education informs us of the mechanisms by which schools reproduce, adapt, and transform society's values. We now have a better understanding of the four functions of the educational system:

- (1) Socialization;
- (2) training and selection;
- (3) change and innovation; and
- (4) personal and social development (Cloutier, Moisset, Ouellet, 1983).

Studies on the biology of education help us to understand the physiological conditions of any educative act. Studies on the brain and language learning are also very instructive. Parallel to psychology, the biology of education raises questions about the role of the other in the child's development and leads to

see man, not as an animal machine or a programmed animal, but as a self organizing animal (Trocmé Fabre, 1987).

The history of education shows how each civilization and epoch has formally or informally defined the facts, situations, and conditions governing the education of people. Research in this field reminds how much evolution there has been in learning content (hunting, military maneuvers, arts, sacred scripture, sciences); place of learning (family, community, army, monastery, school, factory); teaching agents (parents, masters, monks, professors, military leaders); and clientele targeted (children, women, elites, ordinary people, adults) (Gal, 1991).

**The Theoretical Framework:** There are fundamentally three major debates in education; they concern the conception of education, of learning, and of content. The questions revolving around the first debate are the following: What are the goals of education? What is the role of the school? What is the role of the community? From the second debate on the conception of learning, five questions emerge: What is the role of the teacher? What is the role of the student? What are the teaching/learning strategies to be used? What type of evaluation should be used? What material and pedagogical resources are available? The third debate on the conception of content focuses on finding answers to the four following questions: What are the objectives? What are the elements of content? what are the outcomes? What are the criteria of evaluation?

In constructing a theoretical framework we can imagine entrepreneurship development programs evolving in a conceptual space defined in three dimensions:

- 1) A conception of education moving from a tightly controlled training context (organizational dynamic) to educative decisions shared by all community partners (psycho social dynamic);
- 2) A conception of learning where teaching strategies are collective (pedagogical approach) or learning strategies are controlled by learners and adapted to different parts of the program (andragogical approach);
- 3) A conception of content ruled by content and behavioral objectives (declarative and procedural knowledge) and by situational objectives (conditional knowledge). We would now apply this reflex on to EDP practices.

**Testing Ground:** Under an agreement between the Minister de l Education du Québec (MEQ) and HEC's Maclean Hunter Chair of Entrepreneurship, we undertook, in the 1992-93 academic year, an in depth analysis of the implementation process of the MEQ's program entitled "Launching a Business."

The program lasts 330 hours, 220 of which are devoted to acquiring the skill directly related to mastering the task of an entrepreneur and 110 to acquiring broader management skills.

1. Entrepreneurship and training	30 hours
2. Definition of a business project	30 hours
3. Development of a business plan	120 hours
4. Applications of management notions	75 hours
5. Applications of sales techniques	30 hours
6. Negotiation of financing	45 hours

During the pre test, we noted that this program was interesting from more than one point of view. First of all, the content was just as much concerned with awareness of the entrepreneurship phenomenon as with the creation of a new business and the development of an existing business. This led us to consider that such diversity of content, teachers, and milieus would be a good testing ground for the theoretical framework.

**Research Methodology:** We interviewed twice the sixteen trainer coordinators in their respective school boards throughout Quebec. The first time was during November 1992 and the second in April

1993. Based on interviews, analysis of documents, and questionnaires we were able to characterize the educative practices of the sixteen regions with regard to the teaching of entrepreneurship. These practices reflect the conceptions of education, learning, and content to which groups of teachers give preference in their milieu. Finally, the conception of content is measured by the IKM (Integration of Knowledge measurement.) Here it is a matter of identifying the numbers of hours devoted to the teaching and supervision of student projects. The more hours devoted to teaching, the more declarative and procedural knowledge the trainer transmits to the detriment of hours of supervision devoted to conditional knowledge. A weak IKM indicates that the program is focused on declarative and procedural knowledge with no regard for the transfer of knowledge in the project the student has chosen.

**Results and their Interpretation:** Using a hierarchical ascendant classification, we identified eight broad regional adaptations of the Quebec wide "Launching a Business" program. On the conceptual level, we consider them distinctive educative orientations linked to the main theoretical foundations of education. An educative orientation is a particular vision shared by participants in a program regarding their common conception of education, learning, and content (Miller 1983). Below, we pass in review these various orientations: conformist; internal and external adaptive; self training; self learning; transformative; convivial and, finally, communal. Table 2 presents a synthesis of our results.

Table 2  
Eight Educative Orientations of EDPs

Conformist Orientation	Internal-adaptive Orientation	Self-learning Orientation	Transformative Orientation
<ul style="list-style-type: none"> <li>● Weak socio-organizational interactions</li> <li>● Average pedagogical interactions</li> <li>● Weak integration of knowledge</li> </ul> <p>ALPHA</p>	<ul style="list-style-type: none"> <li>● Average socio-organizational interactions</li> <li>● Weak to average pedagogical interactions</li> <li>● Average integration of knowledge</li> </ul> <p>BETA GAMMA</p>	<ul style="list-style-type: none"> <li>● Weak to average socio-organizational interactions</li> <li>● High pedagogical interactions</li> <li>● Average integration of knowledge</li> </ul> <p>IOTA KAPPA</p>	<ul style="list-style-type: none"> <li>● Weak socio-organizational interactions</li> <li>● High pedagogical interactions</li> <li>● High integration of knowledge</li> </ul> <p>LAMBDA MU</p>
External-adaptive Orientation	Self-training Orientation	Convivial Orientation	Communal Orientation
<ul style="list-style-type: none"> <li>● High socio-organizational interactions</li> <li>● Average pedagogical interactions</li> <li>● Weak to average integration of knowledge</li> </ul> <p>DELTA ZETA EPSILON</p>	<ul style="list-style-type: none"> <li>● High socio-organizational interactions</li> <li>● Weak pedagogical interactions</li> <li>● High integration of knowledge</li> </ul> <p>ETA THETA</p>	<ul style="list-style-type: none"> <li>● Average socio-organizational interactions</li> <li>● Average pedagogical interactions</li> <li>● High integration of knowledge</li> </ul> <p>XI NU</p>	<ul style="list-style-type: none"> <li>● Average to high socio-organizational interactions</li> <li>● High pedagogical interactions</li> <li>● High integration of knowledge</li> </ul> <p>RHO PI</p>

In sum, the presentation and interpretation of our results suggest eight ways of teaching the program under study. These eight approaches have found echoes in as many different theoretical orientations. Let's go one step further and construct a synthesis allowing us to understand all the EDPs.

**Synthesis of the Theoretical Foundations of EDPs:** How can we regroup these eight regional adaptations of the Quebec entrepreneurship development program? The notions of type and paradigm will help us along here, both in the area of education and of entrepreneurship theories.

**Types of Entrepreneurship Development Programs:** The institutional type cuts across the conformist and internal adaptive orientations. On the whole, it has an average level of socio organizational interactions, average pedagogical interactions, and average integration of knowledge. As compared to the institutional type, the didactic type posts a 19.8% drop in socio organizational interactions, but one notes a 37.8% increase in pedagogical interactions, and a significant 42% jump in the integration of knowledge. The didactic type is thus characterized by a weak SIM, a high PIM, and an average IKM. Four school boards are associated with the didactic type whose theoretical foundations are linked to self learning and transformative orientations.

Curriculum implementation theories examine the conditions prevalent during curriculum change. The two basic questions asked are: Who will work with this new curriculum? How will this network of people test teaching and learning methods? The reticular type shares these kinds of interrogations.

Structural theories are concerned with two basic questions:

(1) How should educational content be selected and justified?

(2) How should knowledge be organized in a curriculum? These concerns perfectly match our didactic type.

Process theories view curriculum as a process of interaction and development whose adaptations include all dimensions of change, whether individual, institutional, or social. The goal is to promote both the assimilation and adaptation of knowledge at all levels. These theories coincide with what we have called the regionalist type.

The foregoing represents the first level of synthesis of the eight orientations of the EDPs. We shall now pursue our theoretical reflection and ask what links there are between the broad paradigms in the fields of education and entrepreneurship.

**Paradigms of Entrepreneurship Development Programs:** In the field of education, we can easily identify two conflicting paradigms that of the industrial society and that of the educative society. The theories and practices constituting the field of entrepreneurship can also be linked to two broad paradigms: that of the economy of entrepreneurs and that of the society of entrepreneurs. A paradigm includes a conception of knowledge; a conception of relations between persons, society, and nature; a set of values and interests; a way of doing things; and a general sense of meaning.

**Industrial Society and Education:** Born in the XVIII<sup>th</sup> century industrial revolution, this society would gradually help to shape a dominant vision in education that Bertrand and Valois (1992) call the industrial paradigm. This paradigm stresses material progress and economic and technological development. The vision of man is often reductionist, subordinated to an external model and to society as a whole. This view of men and society leads us to think that education must be mainly provided by institutions named "schools", "colleges," and "universities". The paradigm of the industrial society favors collective, individualized, or personalized teaching. No matter what training objective is pursued, this paradigm leads teachers to stress information.

**Educative Society and Education:** Faure (1972), in his famous UNESCO report "Learning To Be," introduces the concept of the educative society: drawn from Plato's Republic, it means that any economic, political, social, cultural, and religious entity will, in addition to its own role, assume educative functions that collaborate with, complement, or replace the school. It is not a matter of occasionally mastering some pieces of definitive information, but of preparing to spend a lifetime in pursuit of constantly evolving knowledge and of learning to be. If, in education, the industrial society and the educative society are the two poles around which the major debates crystallize, what is the case in the field of entrepreneurship?

#### **Economy of Entrepreneurs and Entrepreneurship**

Following Drucker (1985), we say that the dominant paradigm in the field of entrepreneurship is that of the economy of entrepreneurs. This paradigm considers the phenomenon of entrepreneurship strictly from the economic viewpoint and more particularly from that of the creation of businesses. We can say that the paradigm of the economy of entrepreneurs rides on three sets of forces:

(1) Economic forces regulating trade;

(2) Psycho cultural forces determining the entrepreneur's psychological and cultural traits; and

(3) Organizational forces which are shaped by market opportunities.

#### **Society of Entrepreneurs and Entrepreneurship**

Similarly, the paradigm of the society of entrepreneurs is also defined by three sets of forces:

(1) Economic forces of innovation characterized by discontinuity;

(2) Psycho cultural forces permitting innovative behavior and social change; and

(3) Organizational forces forged through networks.

This vision of entrepreneurship is much broader than that proposed by the paradigm of the economy of entrepreneurs. Yet, it is the latter which clearly predominates in the literature.

**Conclusion:** While aware that an exploratory study based on a small sample is inherently limited in its validity and possibility of reproduction, we can suggest three avenues for future research.: Based on our results regarding the four types of EDPs and their definitions, we can construct a matrix for use in classifying EDPs. This framework can be tested on a larger sample which would be representative of the diversity of EDPs worldwide. This long term effort could run parallel to another basic task, that of evaluating the programs. We still know little on this subject: Are programs of good quality and are they effective? It may be hypothesized that the evaluation of a EDP will depend on its place in the classification suggested. Should all EDPs be evaluated in the same way?

As to the impact of EDPs, this research suggests that trainers and their educative orientation are key elements in an entrepreneurship development program. We are of the opinion that it is imperative to develop research action on the training of these teachers, using, among other things, the concepts of this study. We are thus left with three openings to explore over the coming years in the fields of entrepreneurship and education. Here too, the sciences of education will be useful in generating meaningful reflection.

## CHANGING TRENDS IN FISHERIES SECTOR OF INDIA

**Mr. Rahul Vithalrao Thoke<sup>1</sup> & Dr. A. T. Tawar<sup>2</sup>**

<sup>1</sup>Assistant Professor, Athalye – Sapre –Pitre College, Devrukh., Tal. Sangmeshwar, dist. Ratnagiri.

<sup>2</sup> (M.A.,M.phil,D.H.E.,Ph.D.), Associate Professor and Head, Department of Economics, U.G.,P.G. and Research Center, D.S.M\'s College of Arts ,Commerce and Science. Parbhani.

**Introduction:** At the beginning of 20th century Indian economy was agro-base. Agriculture sector was leading sector. Being developing nation, Indian economy has different features and problems from those of developed countries. Over population, huge poverty, unemployment, income inequality, illiteracy, inadequate infrastructure facilities, inadequate availability of social services, etc. To tackle all these problems, Fisheries sector can be played important role. Therefore to strengthen the fisheries sector efforts have been made. Such as infrastructure facilities for fisheries sector have been made available by Government. As a result of that Modern fish processing industries have been set up in all over India near coastal areas. Fisheries sector can be divided into Marine fishery, Inland fishery and Aquaculture. Fishing industry has two main activities. i.e. Harvesting and processing. Fishing activity is included in primary sector and fish processing industry is included in secondary sector.

**Fishery Resources in India:** Fishery resources are divided into two categories i.e. Marine and Inland resources. Both resources are in plenty of amount in India. The Marine resources include marine coastline, EEC and Continental Shelf of India. The country has a long coastline of 8118 km. India has an area of 2.02 million sq km, as Exclusive Economic Zone (EEZ) since 1970 with absolute right of exploiting natural resources within it. The Continental Shelf of India has a total area of about 5,30,000 (0.53 million) sq. km. The inland fishery resources include 1,96,000 (0.19 million) kms stretch of rivers and canals, 31,50,000 (3.15 million ha) hectare reservoirs, 23,60,000 (2.36 million ha) hectare ponds and tanks, Till 2009-10, total brackish water area was 12,40,000 hectare (1.24 million ha) in India. Out of which only 39,750 hectare area was brought under culture through BFDA's. There is much more scope for aquaculture in Brackish water. (Annual Report 2016-17, Department of Animal Husbandry, Dairying & Fisheries, Ministry of Agriculture & Farmers Welfare, Government of India)

**Fish Production in India:** There are four production factors which are used in production process of any kind of goods. They are labour, capital, land and entrepreneur. Production of fish is different from that of any other products. Like, there is no control of Human being on availability of marine and inland resources of fish. Fisheries sector is included in Primary sector with agriculture sector. Nature plays an important role in production of primary goods. Likewise agriculture production, fish production also largely influenced by nature. In monsoon season, breeding of fish decreases therefore there is ban on fishing activities in that season.

**Table 1 : Major fish producing countries (Marine + Inland) 2011 ('000 tonnes)**

Country	Fish production (Marine + Inland)	Percentage to world production (Marine + Inland)
China	54393	34.82
India	8875	5.68
Indonesia	8426	5.39
Peru	8341	5.34
USA	5550	3.55

Source : Handbook on fisheries statistics 2014/FAO Fisheries and Aquaculture Statistics and information Branch. 2013, Global production by production source 1950-2011

In the year 2011, India was the second largest producer of fish in the world and its share in global fish production was 5.68% . However, difference between first largest country i.e. China and India regarding fish production was very high. China's share was 34.82% in global fish production whereas India's share was just 5.68%.

**Table 2 : Major Inland fish producing countries-2011 ('000 tonnes)**

Country	Inland fish production
China	28096
India	5606
Indonesia	3061
Viet Nam	2861
Bangladesh	2578

Source : Handbook on fisheries statistics 2014/FAO Fisheries and Aquaculture Statistics and information Branch. 2013, Global production by production source 1950-2011

After China, India was at the second position among major inland fish producing countries in the world. India was the second largest producer of Inland fish in the year 2011.

**Table 3 : Major Marine fish producing countries-2011 ('000 tonnes)**

Country	Marine fish production
China	26297
Peru	8264
Indonesia	5365
USA	5285
Japan	4244
Russian Federation	4015
Chile	3976
Norway	3419
India	3269

Source : Handbook on fisheries statistics 2014/FAO Fisheries and Aquaculture Statistics and information Branch. 2013, Global production by production source 1950-2011

India's situation in marine fish production is not satisfactory as it has ninth place among major marine fish producing countries in the world and eight countries i.e. China, Peru, Indonesia, USA, Japan, Russian Federation, Chile, Norway have higher marine fish production than India.

**Table 4 : Contribution of India to World Fish Production (in '000 tonnes)**

Year	World Production	Contribution of India	In Percentage
1950	19313	740	3.83
1960	35540	1162	3.27
1970	65381	1759	2.69
1980	71944	2446	3.40
1990	97739	3800	3.89
2000	125943	5609	4.45
2011	156195	8875	5.68

Source : Handbook on fisheries statistics 2014 /FAO Fisheries and Aquaculture Statistics and Information Branch, 2013. Global production by production source 1950-2011

Above table explains India's share in world's fish production. The share of India in world's fish production has increased from 3.83 per cent in 1950 to 5.68 per cent in 2011. World's total fish production increased from 19313000 tonnes in 1950 to 156195000 tonnes in 2011, an eight-fold increase. Whereas fish production in India increased from 740000 tonnes to 8875000 tonnes during the

same period, nearly a twelve-fold increase. Growth in India's fish production has been more than growth in world's fish production due to increasing contribution from inland fishery.

Table 5 : Fish Production and average annual growth rate of fish production in India  
(in '000 tonnes)

Year	Marine	%	Growth rate	Inland	%	Growth rate	Total	%	Growth rate
1950-51	530	71	-	210	29	-	740	100	-

Source : Handbook on fisheries statistics 2014

Total fish production in India has increased from 740000 tonnes in 1950-51 to 5609000 in 2000-01 and 8875000 tonnes in 2011-12. The total fish production was 8875000 tonnes in 2011-12, out of which 3269000 tonnes from marine sector and 5606000 tonnes from inland sector respectively. the share of marine fish in the total production fell from 71% in 1950-51 to 39% in 2011-12, whereas, the share of inland fish in the total production increased from 29 % to 61 % during the same period.

The growth rate of total fish production has been on high level at 5.28% in 2011-12 mainly due to high growth rate of 6.28% in inland fish production. Whereas growth rate in marine fish production has been on low level at 3.7%.

**Disposition of fish catch in India:** Fisheries sector in India has gone through a large transformation process, In ancient period fishing was considered to be a livelihood activity but now a days it is a commercial activity or bussiness. technological development determines the disposition of fish catch. Such as earlier traditional methods were being used for processing on fish i.e. Sun drying, canning, etc. With the development of modern techniques of processing on fish like freezing, curing, etc, structure of disposition of fish has changed.

Table 6 : Disposition of fish catch in India (In '000 tonnes)

	2000- 01	2012- 13	
		%	%
Marketing fresh	4287.83	76.38	74. 24
Frozen	276.60	4.93	12.12
Curing	339.91	6.05	4.25
Canning	50.03	0.89	0.54
Reduction	317.91	5.66	3.85
Offal for reduction	1.32	0.02	0.00
Miscellaneous	34.58	0.62	1.93
Unspecified	69.35	1.24	0.91
Others	236.31	4.21	2.15
Total	5613.84	100	100

Source : Handbook on fisheries statistics 2014/Director of Fisheries, State Govt.

The share of fish catch for marketing fresh fish was highest i.e. 74. 24 % in 2012 as there is lack of adequet processing facilities therefore fishermen prefer to sell fresh fish in the market as possible as early. Out of total fish catch, 6.05 % in 2000-01 and 4.25 % in 2012-13 fish catch was used for Curing purpose. Whereas only 0.89% in 2000-01 and 0.54 % in 2012-13 fish catch was used for Canning purpose.

**Role of fishing industry in economic development of India:** Fisheries sector plays an important role in Economic development specially of coastal areas. Also it is important for the socio-economic development of the country. Fisheries sector gives contribution in economic development by various way. It provides employment, it is a source of cheap and nutritious food as well as it is a foreign exchange earner.

**1 Food security:** Food shortage and malnutrition is the acute problem in developing countries like India. Because the supply of food from agriculture sector is not sufficient, as agriculture productivity is very low in India due to various reasons, such as lack of irrigation facilities, small size of land holding, lack of finance, traditional methods of cultivation, unorganized nature of farmers, etc. In this situation development of fisheries and exploitation of ocean resources at optimum level is necessity to increase supply of food to meet the demand of growing population. On a global level, fisheries sector is major source of cheap and nutritious food supply and it provides animal protein to the economically weaker sections of the society. According to FAO, 17% of global population's intake of animal protein comes from fish\*. Where as in India 35 % population was estimated to be fish eater and their annual per capita fish consumption was 9.8 kg in 1999-2000\*\*.

**2 Employment Generation:** To reduce over burden of labour force on Agriculture sector, pace of industrialization should be accelerated in the economy. Changes occurs in Occupational structure of population of a country with the process of structural change. Percentage share of workers depending on industrial sector increases. While Percentage share of workers depending on Agriculture sector decreases. Fishing is one of the oldest occupations. In ancient period before the cultivation of land, Hunting and fishing was the only source of livelihood. Fishing is the traditional occupation of a community of fishermen. It provides direct as well as indirect employment through its ancillary activities like net making, boat making, salt making, ice making, fish processing, marketing, fish transportation etc. Development of fisheries sector can tackle unemployment problem that is exist in all developing countries like India due to over population. As per the Marine fisheries census 2010, there were 864,550 marine fishermen households in the country. And the total marine fisherfolk population was 3,999,214\*\*\*. According to report by the Government of India (1998 – 99) Fisheries sector provided full time employment to 17,41,265 persons, part time employment to 13,26,983 persons and occasional employment to 82,89,010 persons\*\*\*\*. Both direct and indirect estimated employment was 14 million in fisheries sector in India in 2014-15.(ASSOCHAM)

**3 Export from Fishing Industry:** Developing nations export mainly primary goods. As primary goods have income inelastic demand and inelastic supply, Terms of Trade in forien trade determine unfavourable to them and they can not achieve advantages from forien trade. While, Developed countries export manufactured goods and services. As goods in manufacturing sector have income elastic demand and elastic supply, Terms of Trade determine favourable to them and they can achieve more advantages from forien trade. Developing nations have to face problems of increasing deficit in Balance of Trade and increasing burden of foriegn debt. To overcome these problems Government gives various types of incentives to export sector of the country. There has been increasing trend in demand and consumption of fish products at international markets. Thus, fish products have high potential of export. By exporting fish and fish products developing countries like India can earn foreign exchange required to import necessary goods for economic development of the country. In India, fishery has been playing an important role in the exports.

**Table 7 : Trend in growth of Exports of Marine products in India**

Year	Quantity (Tonnes)	Value (Rs.Crore)	Annual growth rate(%)	Annual growth rate(%)
			Quantity	Value
1980-81	75591	234.84	-12.51	-5.62
1990-91	137667	856.00	24.20	34.81
2000-01	440473	6443.89	28.41	25.94
2013-14	983756	30213.26	5.98	60.23

Source : Marine Products Export Development Authority, Kochi

Export of fisheries products in terms of quantity and value and its annual growth rates for the period 1980-81 to 2013-14 are given in above table. It shows significant fluctuations. It was 5.98 % and 60.23 % in 2013-14 in terms of quantity and value, respectively. In the year 2013-14 the volume of fish and fish products exported was 9,83,756 tonnes worth Rs. 30213.26 crores.

In 1991 free trade policy and liberal policies have been adopted. As a result of that export of fish and fish products from India increased. Also Efforts are being made to produce different kinds of value added products at international quality standard as per demand in international markets for export promotion of fish products.

#### **Composition of Export from Fishing Industry**

Composition of export of any country depends on various factors such as stage of economic development, technological progress, availability of natural resources, environment condition, etc. Before 1960, only dried fish items were exported but with the improvement in processing technologies, variety of frozen and canned fish products are being exported from India

**Table 8 : Export of Marine products by category from India**

(Quantity in tonnes, Value in Rs.Crores)

Fish Products	Q/V	2000-01	2013-14

Source : Handbook on fisheries statistics 2014/Marine Products Export Development Authority, Kochi

During the period 2000-01 to 2013-14, export of major fisheries products in terms of quantity and value are presented in above table. The fisheries products were categorized into Frozen shrimp,

Cuttlefish/Fillets, Frozen squids, Fresh/Frozen fish, Live Items, Dried Fish, Chilled items and Other items. Total export of fisheries products has shown increasing trend in terms of quantity and value. In terms of quantity, it has increased from 4,40,473 tonnes in 2000-01 to 9,83,756 tonnes in 2013-14. In terms of value, it increased from Rs.6,444 crores to Rs. 30,213 crores during the same period. The export of all categories of fish products has increased significantly.

Share of Frozen shrimps and Fresh/Frozen fish is significant in the total of fisheries exports. The share of Frozen shrimps in quantity was 25.40 % in 2000-01 and it has increased upto 30.64 % in 2013-14. Whereas share of frozen shrimps in terms of value was 69.55 % in total export of fisheries in 2000-01 and it has decreased upto 64.10% in 2013-14. Share of frozen shrimps in value is higher than in terms of quantity. It shows that Frozen shrimps could get higher price. While, the share of Fresh/Frozen fish in quantity was 48.34 % in 2000-01 and 32.97 % in 2013-14. Whereas share of Fresh/Frozen fish in value was 13.57 % in 2000-01 and 14.22 % in 2013-14 in total export of fisheries. Share of Fresh/Frozen fish in value is lower than in terms of quantity. It shows that Fresh/Frozen fish could not receive high price.

**Direction of Export from Fishing industry:** Direction of export of any country is determined by several factors such as political relations with other countries, geographical distance, difference in comparative advantage, and degree of trade barriers, etc. Before 1960, fish was exported from India only to neighboring countries like Sri Lanka, Singapore, and Malaysia. With the development of quick transport facilities, fish is exported to various countries like U.S., France, Australia, Canada and Japan. Table no. 9 shows the countrywise shares in exports of fish and fish products from India in terms of quantity and value, during the period 2003-04 to 2013-14.

Table 9 : Export of Marine products by Market from India (Quantity in Metric Tonnes, Value in Rs. Crores)

Market	Q/V	2003-04	2013-14		
			%		%
Japan	Q	50020	12.14	71481	7.27
	V	1163.69	19.10	2463.83	8.15
U.S.A.	Q	53153	12.90	110880	11.27
	V	1682.06	27.61	7744.67	25.63

Total	Q	412017	100	983756	100
	V	6,091.95	100	30213.27	100

Source : Handbook on fisheries statistics 2014/Marine Products Export Development Authority, Kochi  
In the above table countries are divided into four groups as per the region such as South East Asian countries including China, Middle East countries and trading block i.e. EU. Whereas Japan and USA have been taken separately as their share in fisheries export from India is significant. Share of export in value to Japan was 19.10 % in total Indian fisheries export in 2003-04 and it was 8.15 % in 2013-14. There was the largest share of export in quantity and value to U.S.A. i.e. 11.27 % and 25.63 % respectively in total Indian fisheries export in 2013-14.

European Union – 28 countries are members of the *European Union*. Some of the member

countries are Austria, Belgium, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Italy, Netherlands, Poland, Portugal, Spain, Sweden, United Kingdom, etc.

Among the countries of European Union, UK, Italy, Spain, Netherlands and Belgium have the significant share in export from Indian fisheries sector.

South East Asia consists of the countries like Indonesia, Thailand, Philippines, Malaysia, Singapore, Vietnam, Myanmar, Cambodia, etc. China, Thailand and Singapore are the important markets in South East Asian countries for the Indian fisheries products to export. Share of export in quantity and value to South East Asian countries including China was 46.34% and 32.48% in 2013-14 respectively.

Middle East countries - Syria, Israel, Iran, Saudi Arabia, Turkey, Egypt, United Arab Emirates, Iraq, Lebanon, Qatar, Jordan, Yemen, Bahrain, Kuwait, Oman and Cyprus are the part of Middle East. Share of export in value to Middle East countries has increased from 3.31% in 2003-04 to 5.29% in 2013-14 in total Indian fisheries export.

**4 Contribution of fisheries sector to GDP of India:** The Contribution of fisheries sector to GDP has increased from Rs.4547 Crores in 1990-91 to Rs.78053 Crores in 2012-13. The production of fisheries sector increased by ---% between 1990-91 and 2012-13. The Contribution of fisheries sector to GDP has been significant. Share of Agriculture, Industrial and Service sector in Gross Domestic Product (GDP) changes with the process of structural change. Share of Agriculture sector in GDP is decreasing while share of Industrial and Service sector in GDP is increasing.

**Table 10 : Contribution of fisheries sector to GDP of India (at current prices) (Rs.in Crores)**

Year	Total GDP	GDP from Agriculture, Forestry & Fishing	GDP from Fisheries	% in Total GDP	% of Agriculture, Forestry & Fishing
1990-91	531814	154350	4547	0.85	2.95
2000-01	1991982	460608	20948	1.05	4.55
2012-13	9388876	1644926	78053	0.83	4.75

Dr. K. B. Shejul (243-244)

## MICRO-FINANCE IS THE NEED OF THE AGE!

**Prof. Dr. K. B. Shejul.**

(HOD, Dept of Eco.), Dr. Babasaheb Ambedkar college Mahad-Raigad.

Finance is the like Blood of Business without sufficient funds neither any business can be started nor run successfully. The provision of adequate and timely finance is of basic importance for the smooth working of the industries and their expansion. As we know every country is conducted a wide campaign for financial inclusion by the expansion of modern banks. But still around half of the population is financially excluded; most of them are less affluent people including poor and moderate poor. It means they have not paid interest to the capitalist class. Micro finance is an agenda of capitalist class to financial inclusion means, poor are compelled to pay interest and they are subject to exploitation. Poor people generally not received interest because they have no money to save or invest. Therefore Micro finance is a net to catch small fishes; it mobilizes huge amount of interest from poor class and flow it to the rich. When rich people got loans from commercial banks and other financial institutions at low rate of interest (from 4% to 12% in India) the poor receives the same from micro finance institution at very high rate from 24% and above. Then it is celebrating as a tool for poverty alleviation.

### • What is Micro Financing ?

Very often the term micro credit and micro finance are used as interchangeable terms and they denote one the same thing. Micro finance is the extension of small loans to very poor entrepreneurs who do not qualify for traditional bank loans. It includes micro savings, micro credit and sometimes various forms of micro insurance schemes. It is connected with money as well as information.

Micro finance not only increases income, savings, loans, investments and repayment of loans by poor but it empower the poor through personal transformation from a feeling of *"I can not" to "I can"* do something about my poverty. i.e. somebody say regarding micro finance, *"Small is always Beautiful & Beneficial."*

### • Need of Micro-Finance in India:

Micro-financing is more essential in developing countries like India because of the following aspects:

- 1) Formal financial sector is unsuccessful in providing sufficient finance to the poor because of lack of collateral security and high transaction costs.
- 2) Informal financial sector charges interest at very high rate and other conditions of loans are such that result in all kinds of exploitation of poor.
- 3) Micro-Finance is given mainly through Self Help Group. Members of the SHGs somewhat identical. The administration is participatory. It results in high rate of repayment.
- 4) As it is group and there is an involvement of co-borrowers the supervision cost is low.
- 5) In Micro-Financing the collateral security is replaced by collective guarantee of group members, It ensures repayment of loans and recycling of funds which are essential for growth of banking business.
- 6) The Self Help Groups are mainly established by women, It result in empowerment of women which is essential in developing countries.
- 7) As SHG is very informal organization. It is not necessary to complete complicated costly legal formalities of establishment. So this is more suitable to poor people residing in villages and interior parts of India.

• **Objective of Micro-Finance:** The organization working to promote micro finance institutions in different parts of the world determines various objectives to micro finance. The important among them are listed as follows.

1. Promote socio-economical development at the grass root level through community-based approach.
2. Develop and strengthen people's group called Self-Help Groups and facilitate sustainable development through them.
3. Provide livelihood training to disadvantaged population.
4. Promote activities which have community participation and sharing of responsibilities.
5. Promote programs for the disabled.
6. Empower and mainstream women.
7. Promote sustainable agriculture and ecologically sound management of natural resources.
8. Organize and co-ordinate networking of grass root level organization.
9. Get benefits by reducing expenditure and making use of local resources as inputs for livelihood activities.
10. Increase the number of wags days and income at household level.
11. Poor people need a variety of financial services, not just loans.
12. Micro finance is powerful tool to fight poverty.
13. Micro finance means building financial system that serves the poor.
14. Micro finance can pay for itself, and must do so if it is to reach very large numbers of poor people.
15. Micro finance is about building permanent local financial institutions that can attract domestic deposits, recycle them into loans, and provide other financial services.
16. Micro credit is not always the answer. Other kind of support may work.

• **Micro Finance Models in India:** A wide range of microfinance models are working in India. Experts opinions is that India host the maximum number of microfinance models. Each model has succeeded in their respective fields. The main reason behind the existence of these models in India may be due to geographical size of the country, a wide range of social and cultural groups, the existence of different economical classes and a strong NGO movement. Micro Finance Institutions in India have adopted various traditional as well as innovative approaches for increasing the credit flow to the organized sector. They can be categorized into six broad types.

- 1) Grameen model
- 2) SHGs model
- 3) Federate SHGs model
- 4) Co-operative model
- 5) ROSCAs
- 6) Micro-finance companies (MFCs)

• **Conclusion:**

The entire world of 21<sup>st</sup> century is thinking and planning for poverty alleviation, environment protection, empowerment of weaker section of the providing and quality among all. All these objectives can be achieved only by providing Micro-finance through Self Help Groups **to poorest of the poor**, So Bankers of 21<sup>st</sup> Century cannot afford to neglect micro financing but they have to undertake this activity on large scale. As new private sector banks such as ICICI Bank & Other Banks have entered in the field of Micro-Financing. Most of the Commercial Banks are implementing micro-finance operations through its SHGs at different levels. E.g. Maharashtra, Karnataka, Kerala, Andhra Pradesh & Bangladesh, etc. are excellent models of Micro-Finance.

*Dr. Suresh Sitaram Nale (245-247)*

## **POVERTY IN INDIA**

**Dr. Suresh Sitaram Nale.**

I.C.S. College Tal: Khed. . Dist Ratnagiri

### **Introduction:**

Poverty can be defined as a social phenomenon in which a section on the society in unable to fulfil even its basic necessities of life. When a substantial segment of a society is deprived of the minimum level of living and continues at a bare subsistence level, that society is said to be plagued with mass poverty. The countries of the third world exhibit invariably the existence of mass poverty, although pockets of poverty exist even in the developed countries of Europe and America. Two types of standards are common in economic literature: the absolute and the relative. In the absolute standard, minimum physical quantities of cereals, pulses, milk, butter, etc. Are determined for a subsistence level and then the price quotations convert into monetary terms the physical quantities. Aggregating all the quantities included, a figure expressing per capita consumer expenditure is determined. The population, whose level of income (or expenditure) is below the figure, is considered to be below the poverty line. According to the relative standard, income distribution of the population in different fractile groups is estimated and a comparison of the levels of living of the top 5 to 10 per cent with the bottom 5 to 10 per cent of the population reflects the relative standards of poverty. the defect of the latter approach is that it indicates the relative position of different segments of the population is the income hierarchy. Even in affluent societies. Such pockets of poverty exist. But for underdeveloped countries, it is the existence of mass poverty that is the cause for concern.

### **2. ECONOMIC REFORMS AND REDUCTION OF POVERTY-**

A natural question arises : what has been the impact of economic reforms initiated since 1991 on poverty reduction? Dr.Gaurav Datt of the world bank in his article “has poverty declined since economic reforms ?” has drawn the following conclusions:-

1. While there was a marked decline in both rural and urban poverty rates between 1973-74 and 1986-87, there is no sign of anything comparable thereafter.  
For the rural sector, for the period 1973-74 and 1990-91, headcount index of poverty declined at the annual rate of 2.7 per cent, the rate of decline since then (i.e. in the post-reform period) is not significantly different from zero.  
For the urban sector, during 1973-74 and 1990-91, head count index of poverty declined at the annual average rate of 2.2 per cent, the same trend is continued in the post-reform period (1990-91 to 1996-97) at the annual average rate of 2.2 per cent.
2. While the urban sector seems to have continued its march of poverty reduction in the process of growth, rural poverty reduction was choked off by lack of rural growth.
3. Dr. Gaurav Datt has identified stagnation in rural growth as the basic cause of slowdown in poverty reduction. This naturally puts a question mark on the very nature of the reform process in terms of rural welfare.

**Emerging Issues:** As noted above different figures are being presented by the government about poverty. Therefore it is difficult to understand that how many people in India are poor. Periodically varying definitions of the poverty line tend to complicate the matter further. In the absence of an appropriate definition, efforts to remove poverty cannot be meaningful. In the past various measures have been adopted by the government to tackle the menace of poverty in the country. Cheap grain, other

foods and kerosene through the PDS, rural and health facilities etc., are some key government programmes in this direction. Government has also proposed food security legislation, according to which, for all people living below poverty line, the provision would be made for access to necessary food at affordable prices. But absence of appropriate definition is coming in way of a judicious poverty elimination programme. Recently supreme court has questioned the basis of defining the poverty line according to which only 36 percent of the population is living below poverty line it may be noted that some time back expert group headed by prof. Suresh D. Tendulkar, had suggested an improved definition for measuring poverty, on the lines of which formula for measuring poverty has also been suggested the same has also been accepted by the planning commission. Before the report of the expert group, the government assessment of poverty was that in 2004-05 only 28 percent people were poor and the same has dropped to only 28 percent people were poor and the same has dropped to only percent in 2007. According to new definition of poverty, necessary expenditure on health and education has also been included while assessing poverty. But supreme court has questioned even this 'improved definition' of poverty. According to prof. Tendulkar's definition, a person would be treated as poor, as on 2004-05, if his monthly income is less than Rs 446.68 in rural areas and Rs 578.8 in urban areas. Considering the data submitted by the planning commission. supreme court questioning the methodology, has asked the planning commission, that how a person would be able consume 2400 calories in rural areas and 2100 calories in urban areas with less than Rs.20 a day in urban areas and less than Rs.15 a day in rural areas. It may be noted that as per the basic definition of poverty, intake of 2100 calories in urban areas and 2400 for urban areas has been the basis of drawing the poverty line in India. as per this standard, 56 percent of population was estimated to be living below poverty line in 1973-74. Before 1973-74, poverty line was defined in such a way that the estimated of poverty line was based on the requisite expenditure to attain the desired quantum of calories. But estimation of poverty in 1993-94 and 1999-00 were devoid of any sense of proportion and statisticians at planning commission were able to bring down the number of poor by statistical jugglery and change in definition of poverty. Critics believe that as per the calorie standards, had the price data been 80 percent and in urban areas it would have been 50 percent. If we accept the data presented by the planning commission, we find that a person getting daily income of Rs.20 or more on urban areas and Rs.15 or more in rural areas would not be called poor. If we look at the internationally most commonly accepted definition of poverty, it is US\$ 1.25 a day. If we convert the same in rupees, it would amount to Rs.58 per day. Though even this is lower than what is required for subsistence, but a definition which gives poverty line of this amount seems highly in appropriate. If planning commission's definition of poverty itself calls for a minimum consumption of 2400 calories rural areas and 2100 calories in urban areas, how can this be achieved with less than Rs.20 in urban areas and Rs. In rural areas, answer to this basic question, has been sought by the supreme court from planning commission. Some time ago, the government constituted a committee for the unorganized sector under the chairmanship of Arjun sengupta, which reported that more than 77 percent of the countrymen are managing with less than Rs.20 day or less. It is easily understandable that it is not possible to meet minimum requirement of a person's food, shelter and clothing with so little. it means that more than 77 percent of the countrymen cannot even meet their basic needs, whereas poverty measured as per the mathematical method gives a figure of merely 36 percent. Such varying figures about the number of poor create confusions and make the task of elimination of poverty difficult. Though tendulkar's report has tried to correct the definition of poverty by including requisite expenditure on education and health, but even that has failed to address to the realities. To make it real poverty line, government has to take a realistic view of poverty. If the government has to implement right to food earnestly, it must correct its assessment of poverty.

**Conclusion:** The conclusion emerges from the analysis of poverty line. Firstly, the procedure of upgrading poverty line on the basis of price index needs a review and this should be accompanied by the norm of calorie intake. Secondly, the basis of poverty line was decided four decades ago in 1969. For a developing economy with an aspiration of becoming a super – economic power by 2020, it is all the more necessary to develop a basic needs approach poverty line, instead of a uni – dimensional poverty line based on calorie intake of food primarily which is only a starvation line. This will entail greater effort on the part of the state to take steps so that the benefits of rapid economic growth reach ‘aam adami’ (common man) to use phrase of the congress manifesto. Then, it will shake use out of our complacency about poverty in India. We have miles to go before we sleep.

## **WOMEN EMPOWERMENT AND SOCIAL SECURITY THROUGH “SELF HELP GROUP”**

**Dr. Atul. H. Salunke (Principal)**

*K.E.S Dr. C.D.Deshmukh College, Roha –Raigad*

**Introduction:** If women empowered to do more and more the possibility of economic growth become apparent eliminating a significant part of a Nation workforce as the sole basis of gender can have detrimental effects on the economy of that nation. In addition female participation in counsels, groups, and business is seen to increase efficiency. Although women represent bulk of the labour force, especially in developing countries, they are not brought under the main stream of development and they are denied of appreciation for their contribution. Factors which contribute women's Participation in the labour force include education, marital status, number and age of children, health, their rights in property and assets, and employment opportunities etc

**Empowerment of Women:** Empowerment refers to increasing the spiritual, political, social, educational, gender or economical strength of individuals and communities. In economic developments, the Empowerment approach focuses on mobilizing the self help efforts of the poor, rather than providing them with social welfare, economic empowerment is also the empowering of previously disadvantage section of the population Empowerment is a multi dimensional social process which helps the individual to gain control over their lives. Employment is a social action process that promotes participation of people, organization and communities in gaining control over their lives in their community and larger society. Women empowerment it is broad concept which includes self decision regarding education, participation mobility, economic independency, public speaking awareness and exercise of right, political participation and many more factors insure women empowerment In short women empowerment is the breaking of personal limitations. Amartya Sen.- Nobel laureate-Empowering women and girls with more choice sand more freedom is crucial to achieving a better future for all When women are supported and empowered all society gets benefit; .their families are healthier more children go to school, agricultural reductively improves, and income increase. In short communities become more resilient. Empowerment is not essentially politically alone; it is a process having personal, economical, social and political dimension with personal empowerment being the core of the empowerment process. In fact political empowerment will not succeed in the absence of micro finance through SHGs creates empowerment promoting condition for movements to move position of marginalization within Household decision making process and exclusion within the community to one of greater centrality, inclusion of voice. The social process of micro financing programmed strengthens women self esteem and self worth, instill a greater sense of awareness of social and political issues leading to increase mobility and reduce traditional seclusion of women. Most impotently micro finance program enable women to contribute to the house hold economy, increasing their intra- house hold bargaining power. Thus micro financing through self helping group has transferred the real economic power in the hands of women and has considerably reduce their dependence on men. The impact of SHG's on Socio-Economic status of women was found significant. Change is found in the areas of education housing facilities, Exposure to mass media, occupation size of holding and material possession.

### **Objectives of the Study:**

- 1) To study historical development of Self Help Groups.
- 2) To study the organization and structure of the SHGS.

- 3) To evaluate the performance of the SHGS.
- 4) To study of change SHGS economic condition.
- 5) To find out the problems related to SHGS.
- 6) To highlights the impact of Micro Finance

**Hypothesis:**

1. The level of individual empowerment increases with association of SHG's.
2. The poor is able to get cheap and easy loan through SHG's without security.
3. The profits of the SHGs are not re-invested but distributed in the form of Consumer goods to members.
4. Women participation in public and social programs has increased after joining SHG's.

**Findings of the study:**

Following are the major findings of the research work:

1. Women are economically self-reliable and she can also provide employment to other members and women in the village.
2. She is confident to speak to outsiders including village leaders, social workers, and politicians. Increase social awareness
3. SHG members was increase pressure on local leaders and politicians to solve the problems in the villages.
4. SHG\_s, members gate the loan in reasonable interest rates and invest them for productive income generation activities.
5. All members paid their installment regularly and promptly Hence the earlier belief that poor person fail to repay the loan is discarded and theView that \_poor are bankable\_ is true.
6. It was found from the study that none of the selected SHG\_s, had life and health insurance policies for their members. This is very important because any natural calamities or disasters to members need to be compensated by risk coverage measures.
7. The 50% subsidy and low rate of interest charged by Govt. to BPLSHG's are a great source of inspiration to poor families and also a great relief to the members.
8. The status of women has increased and they are respected in their families, village and society. She now takes active part in decision making of the family and also in Gramsabha. She discusses the problems in the village with local leader related to common issue likes schools, Primary health centers, cleanliness and hygiene, gender equity, legal rights of women, adult literacy, and water supply and tries to find out solutions.
9. It is found that in some villages, the SHG members were successful to close down liquor shops.
10. It was found that the profits of SHG's are wisely invested. A large number of SHG's have added the dividends to their saving which was given as loans to the needy members. However, some SHG's have distributed the profit in cash and arranged trips for their members.
11. The flow of institutional credit has increased through SHG-Bank linkage Programmed because the savings of members and other sources like society, constitute a very small percentage of financial needs of the SHG's. As such, the Govt. and NGO\_s (BPL + APL) together rely on institutional finance to the SHG's. However there is demand for more

amount of loans.

**Suggestions:** On the basis of analysis of the survey and findings of the study following suggestions can be made to improve and enhance the performance of SHG's in general.

1. There is need to, emphasize on reproductive use of loans for income generating activities than using it for consumption needs. Separate

Consumption loans should be given to the needy members based on their savings and repayment capacity. As a result, clients will not divert

Production loans to meet their consumption needs.

2. Community representation in the form of Bank mitras, can act as a connect between the SHG movement and community at large.

3. The insurance of members need to be considered on priority basis, which cover health, life, assets and accidents of SHG members. The women

Enterprise does not have any risk coverage at present. The insurance scheme need to made mandatory to all members, who avail credit and the

Premium should be paid by the promoting agencies as an extended credit and be recovered by the members along with loan installments. More

Serious and consolidated efforts are to be made by Govt., NGO's and insurance companies in this regard.

4. Goal oriented savings products needs to be introduce for members of SHG's.

5. More serious efforts are necessary to the marketing aspects of SHGs product though Govt. has introduce many innovate schemes still,

There is an acute problem of marketing and SHG products fail to compete in the open market. Fairs, exhibitions, workshops and other programs

Have definitely helped but only to a limited extent. There is an urgent need to evolve suitable methodology for promoting SHG products besides imparting special marketing skills and risk taking abilities to the members.

6. PACS as Self Help Promoting Institution: PACS are expected to improve their business and their clients outreach for their improve the participation in the SHG-Bank linkage Programme and also lead to its improved business and profitability of PACS.

7. There is a need for establishing a Computer MIS for SHG's and SHG's federation to monitor their performance on regular basis.

8. SHG's federation must be able to publish their annual reports and share those with all their members.

9. Governance of SHGS federation is a major challenge, overcome as a sustainable institution of the poor.

## **A STUDY OF REGIONAL IMBALANCE IN INDIA**

**Katkar Sangita Bhalchandra**

*Dr. Tatysaheb Natu College of Arts & Commerce Margtamhane. , Tal. Chiplun  
Dist. Ratangiri*

**Introduction.-** Balanced regional growth is necessary for the harmonious development of federal state such as India. India, however, presents a picture of wide regional variations, in terms of such indicators of economic growth as per capita income, the proportion of population living below the poverty line, working population in agriculture, the percentage of urban population to total population. The percentage of workers in manufacturing industries, etc. Relatively speaking, some states are economically advanced while others are relatively backward. Even within each state, some regions are more developed while others are almost primitive. The co – existence of relatively developed and economic – cally depressed states and even regions within each state is known as regional imbalance. Regional imbalances may be natural due to unequal natural endowments or man – made in the sense of neglect of some regions and preference of others for investment and development effort. Regional imbalances may be inter –state or intrastate; they may be total or sect oral. Economic backward- ness of a region is indicated by symptoms like high pressure of population on land, excessive dependence on agriculture leading to high incidence of rural employment, absence of large-scale urbanisation, low productivity in agriculture and cottage industries etc.

### **2. CAUSES OF ECOMOMIC BACKWARDNESS AND REGIONAL IMBALANFCES-**

1. There are certain deterrent factors which come in the way of rapid development of a region: most important of these are the geographical isolation, inadequacy of economic overheads like transport, labour, technology.

Historically, the existence of backward regions started from the British rule in India. The British helped the development of only those regions which possessed facilities for prosperous manufacturing and trading activities. Maharashtra and west Bengal were the states preferred by the British industrialists. The three metropolitan cities – Calcutta, Bombay and madras –attracted all the industries and the rest of the country was neglected and remained backward.

2. The rural areas were continuously pauperised and the farmers remained the most oppressed class, the zamindars and the moneylenders were of course, the only prosperous persons on the rural scene. The absence of effective land reforms allowed the structure in most of rural India to remain in imical to economic growth. The uneven investment in irrigation during the British period helped some areas become prosperous under the British rule.

In developing countries, the developed regions are generally confined to urban centres and urban areas. This is mainly because physical geography controls economic growth in a greater degree in developing countries than in developed countries. For example, Japan and Switzerland have overcome the handicaps of mountain terrain but our Himalayan states, viz., northern Kashmir, Himachal Pradesh, the hill districts of U.P. and Bihar and NEFA, have remained backwards and undeveloped mainly because of inaccessibility. Climate too plays an important role in the low economic development of many regions in India as reflected in low agricultural output and absence of large –scale industry.

3. Some regons are preferred because of certain locational advantages. The location of iron and steel factories or oil refinerrirs will have to be only in those technically defined areas, which are optimal

form all the standpoints considered together. Naturally, as the process of development gains momentum, they attract labour, capital trade and the external economies offered by the developing regions.

4. New investment, more so, in the private sector has a tendency to concentrate in an already well developed area, thus reaping the benefit of external economies. This is but natural form the private sector point of view, since well developed area offers private investors certain basic advantages, viz, labour infrastructure facilities, transport and the market.

Nature of development during the planning era

Serious regional imbalances resulted during the period of planned economic development since 1950-51. Even though balanced development was strongly endorsed by the industrial policy resolution of 1956 accepted as one of the principal objectives of economic planning from the second plan onwards, it was almost completely ignored by our planners and the licensing authorities.

5. The planning mechanism has itself accentuated the disparity between the states by having a strong bias in favour of developed states and neglecting less- developed states. The more developed states were clearly favoured and the less developed states were neglected in planned outlay. Punjab and Haryana have always received the highest per capita plan outlays from the first plan to the eight plans. In fact, the first four of five states have always received larger allocation of plan outlays in all the five year plans. At the same time, the poorest states like Bihar, Orissa, Uttar Pradesh and Rajasthan have continued to receive the smallest allocation per capita in all the plans. Accordingly the disparity between the states in India has been widening. This is despite a clear objective of planning to achieve regional balance in development.

Since 1951, considerable investments have been concentrated at a few places like Mumbai, Ahmadabad, Delhi, Kanpur, Calcutta, Bangalore, etc. On "efficiency criteria." these areas have outgrown their capacities and are faced with serious problems of congestion, slums, transport. Public health, etc. At the same time, they are causing serious brain and resource drain from the adjoining areas. They "act as suction pumps, pulling in more dynamic elements from the more static regions." While the growth elements from the more static regions. "While the growth centres experience rapid, sustained and cumulative economic growth, the neighbouring regions have experienced outflow of people, capital and resources.

6. The adoption of the new technology in agriculture during the 1960s has also aggravated regional economic disparities. Working on the assumption of using the scarce resources in the most productive way and maximising foodgrains production to solve the problem of food shortage, the government concentrated its resources on farmers of heavily irrigated tracts in different parts of the country. These farmers were already well – off and they were made still better – off. On the other hand, dry – land farmers and non – farming population of the countryside have been left out. This has led to widening of the gap of income disparities between irrigated and dry areas and between large farmers and small farmers in every state.

The government did make an attempt toward decentralisation and development of backward regions through public sector investment programmes in such areas as Rourkela, Bhili, Barauni, etc, but as the ancillary industries did not come up fast enough heavy investment by the centre.

Finally, there was an additional factor for growing regional imbalance after independence. While some state government's devoted much attention to the industrial development of their regions – Punjab, Haryana, Gujarat, Maharashtra and Tamil Nadu (at one time) are examples- others were more interested in political intrigues and manipulations than in rapid and balanced economic growth of their areas.

### 3. POLICY MEASURES TO REMOVE REGIONAL DISPARITIES

The planning commission of India has sought to tackle the problem of regional disparities and backwardness particularly in three ways:

- (a) The recognition of backwardness as a factor to be taken into account in the transfer of financial resources from the centre to the states :
- (b) Special area development programmes directed at development of backward areas; and
- (c) Measures to promote private investment in backward areas. We shall deal with these there policy measures in greater detail.

**(A) Backwardness and resource transfer:** the finance commissions in India have used backwardness of a state as one of the criteria for the transfer of funds from the central pool to the states. The resource transfers relate to central assistance for state plans, transfers effected under the recommendations of finance commission, ad hoc transfers from the centre to the states, the distribution of long –term and short –term credit from financial institutions etc. The share of hte backard stated in plan outlay and in central assistance steadily rose from 48 per cent in the first plan to 57 per cent in the third plan. Since then, the share of the backward states in central plan assistance has been gradually declining to 50 per cent in the fifth plan, 36 per cent in the sixth plan and 37 per cent in the eighth plan the tenth plan has projected a further decline to 36 per cent. so as to backward states. Even the revised formula for central assistance could not till the balance in favour of backward states as was intended. There are certain basic difficulties in solving the problem of regional disparities and backwardness through transfer of resources from the centre to the states. There is no guarantee that the resources transferred from the centre to the states would be automatically used for the development of the backward areas or districts. In fact there is a “tendency to divert funds intended for backward and difficult to more forward areas and easier programmes.”

**(B) Special area development programmes**

Specific plan schemes have been formulated with central assistance to develop hilly areas, tribal areas and drought – prone areas. Moreover, schemes of rural development directed towards the improvement of specific groups like small farmers and agricultural labourers were also located in back ward areas. In course of time, these special schemes for particular target groups, become a part of the programme of block level planning for integrated for integrated rural development and full employment. The eleventh Finance commission did not make backwardness as such a criterion for resource transfer, but in the formula for resource transfer, among the different criteria, the relative distance of the per capita income of state with the income of the state with the income of the state with highest per capita income and the index of infrastructure development were indirectly used to include backwardness. On the basis of the new formula, backward states and special category states, taken together would receive 61.2 per cent of total resource transfer. As per data provided in table 9, the central government and the twelfth finance commission have made efforts to reallocate resources in favour of the backward states. Out of the normal central assistance, as against a population of 52.5% belonging to forward states, only 44% of the funds were provided. Similarly, the twelfth finance commission allocated only 41.4% of the total funds to forward states. Consequently, backward states with a population of 47.5% received 56% funds under normal central assistance and 58.6% share as per twelfth finance recommendation. This indicates the intention the central government to tilt the balance of allocations in favour of backward states.

**(C) Incentives to promote investment in backward areas:** Various incentives, both fiscal and otherwise, have been provided in order to tackle the problem of industrial backwardness and to promote

private investment in backward areas. These incentives have been provided by the centre, by the states and by public sector financial institutions.

**(D) Central government incentives:** The government of India has been providing important incentives to promote private investment in back-ward areas. These incentives are :

- (a) Income tax concession : new industrial units located in backward areas set up after January 1971 are allowed a deduction of 20 per cent of profits for computation of assessable income. This concession introduced in April 1974 was to be available for a period of 10 years.
- (b) Central investment subsidy scheme : the scheme of central investment subsidy, as originally announced in 1970, provided for an outright subsidy at the rate of 10 per cent subject to a maximum of Rs. 5 laths on fixed capital investment, viz., land, buildings plant and machinery. The rate of subsidy was subsequently raised to 15 per cent and still later to 20 per cent.

However, the block/talukas/extensions of townships in category B and C areas which have exceeded an investment limit of Rs.30 cores as at the end of March 1983 were to be excluded from the scope of the investment subsidy scheme.

With effect from April 1984, the maximum limit of central investment subsidy had been raised to Rs. 50 laths at the rate of 25 per cent in the case of electronics industries set up in hilly districts.

- (c) Transport subside scheme : under this scheme, introduced in July 1971, industrial units set up in hilly, remote and inaccessible areas were entitled to 50 per cent transport subsidy on the expenditure incurred for movement of raw materials and finished goods to and from certain selected rail heads to the location of the industrial units. The scheme is applicable to remote and inaccessible areas in Jammu and Kashmir and north-eastern hill states.
- (d) Other measures : the central government has also initiated a scheme at assisting state governments in infrastructural development in identified “no-industry districts” up to one-third of the total cost of such development subject to a maximum of Rs.2 cores. Under this scheme, the central government has helped to develop many growth centres through infrastructure development.

**(E) State government incentives:** State governments have also offered incentives to attract private sector units to the backward region. These incentives include provision of developed plots with power and water on a no- profit no – loss basis. Exemption from payments of water charges for some years, interest – free loans on sales tax dues, exemption from Octopi duties, exemption from payment of property taxes for some years, preferential treatment for the purchase of stores for units located in backward areas, subsidy on industrial housing scheme etc. In recent years more than half the assistance sanctioned by SFCS, SIDCO and SIICS went to districts designated backward for the concessional finance schemes.

## **ROLE OF MICROFINANCE IN RURAL WOMEN ECONOMIC EMPOWERMENT IN LATUR DISTRICT**

**Dr. Pawar Avinash Vilasrao**

*Department of Economics, Jaikranti Arts & Commerce college, Latur*

**Introduction :-** Today, every country is trying to make economic development. Economic development is not only related to the increase in national income, technological progress and modernization of society but it is also concerned with the equal allocation of product and Natural resources by eliminating unemployment and inequality in the country. According to Dudley Seers, it is necessary that the country's poverty, unemployment and inequality should be reduced for economic development in a country. If the answer to any of these components is negative though the country's per capita income doubles, it is not true development. Therefore, there is a need to reduce poverty, unemployment and inequality for economic development. Famous Pakistani economist Mehboob-ul-Haq says, solving the issues like poverty, illiteracy, unemployment and inequality should be the main objective of development. It shows that for the economic development, they have to pay more attention to the problems of poverty, unemployment and inequality. The eminent economist Amartya Sen has clarified the concept of development in his book "Economic Development and Freedom". According to him, many people in the world have to suffer from many such inequalities as malnutrition, health, food, clothing, shelter, education, and pure water. Without removing this inequality, development is not possible. The picture of these disparities between women and men is terrible in all these inequalities. In developing countries like India, Pakistan and Bangladesh the picture of gender inequality frightening. Women are deprived of basic needs like education, health, medical facilities and pure water. They do not have social, economic, political development. But this inequality between men and women should diminish for the development of the country. Therefore, women should be empowered. Woman's participation in development process is very important. Dr. S. Radhakrishnan says, 'Progress of our land can not be achieved without the active participation of our Mothers, Sisters and daughters'. Therefore, this inequality among men and women should be eradicated for economic development of the country. Women should be involved in the development process. Development is impossible without bringing women into the mainstream of development. For this, women need empowerment. Though the Constitution of India has bestowed the Right of Equality on women, they do not get the equal treatment as compared to male. They are treated inferior or secondary to male. Because of so called secondary treatment and their inferiority complex, they are far behind from social, economic and cultural development as compared to male. They became alienated in their own home on the basis of gender bias. They are not self-dependent. They are leading a life of parasite. They are not equally treated and developed as male members of the family. Their opinions do not carry any importance in the eyes of male members of the family. They have been kept away from medical facilities, education and nourishing food. This kind of situation can be seen since olden days in India. There is no change in the said situation even after the 69 years of independence of India. Women should be included in the process of development. Without their active role we can not achieve the development in real terms. They must be brought in the flow. They should be strengthened socially, economically and culturally. Microfinance has become one of the dominant tools in Women empowerment.

### **Objectives :-**

- 1) To know what microfinance means ?

2) To know the role of microfinance in economic empowerment of women.

### **Hypothesis**

- 1) H0 1 Due to micro financing, there has been no significant change in the income of women in Latur District.
- 2) H0,2 Due to micro finance, there has been no significant change in the annual assets of women in Latur District.
- 3) H0 3 Due to micro finance, there has been no significant change in the annual expenditure of women in Latur District.
- 4) H0 4 Due to micro finance, there has been no significant change in the savings of women in study area.
- 5) H0,5 Due to micro finance, there has been no significant change in the annual loan level of women in study area.

**Research Methodology :-** The present study area is limited to Latur district. Only Random sampling Techniques is used to draw sample for present study. Primary data is collected through 213 woman swarojgari s interviews. Paired sample t test has been used to understand the changes in women's income, value of property, expenses, savings and loans due to micro finance.

**Meaning of Microfinance :-** Women entrepreneurs through out the world contribute to economic growth and the sustainable livelihood of their families and communities. Microfinance helps to empower women from poor households to make this contribution. Microfinance – the provision of financial services to the poor in a sustainable manner – utilizes credit , savings and other products such as micro insurance to help families take advantage of income generating activities and better cope with risk.

The procedure of Microfinance is somewhat different than the traditional procedure of bank loan. Initially, people living in poverty and are deprived of growth are clubbed and divided into different SHG's. There are 10-20 members in each of such SHG's. These members are oriented towards the savings to make themselves independent and to make them economically competent. After a short duration of time, these SHG's have their credit in the bank and able to get loan from the bank for minor project. In this fashion, the members of SHG are able to get financial assistance for their business.

### **Impact of Microfinance SHG on Economic empowerment of women swarojgari**

**Source :-** out put of SPSS ( primary data – survey 2011-12 )

### **Significant at 0.01 level**

Since t value is significant at  $\alpha = 0.01$  level the above null hypothesis is rejected **and** alternative hypothesis is accepted . Thus it can be concluded that

- 1) Due to micro finance, there was significant change in the annual assets, annual income, annual expenditure, annual savings and annual loan level of women.
- 2) There was significant increase level of income, assets, expenditure, savings, and loan of the Women SHG after joining Microfinance programme.

Thus it can concluded that there was significant improvement in economic status of SHG women members after joining the Microfinance programme. But the question is that, Women's economic condition improved due to micro finance programme, but Is this improvement till the families are expelled from the poverty line? For this It has to see the impact of micro finance on the poor.

**Impact of Microfinance on poverty :-** Poverty estimates for the year 2011-12 have been estimated as per recommendation of Tendulkar committee. For Maharashtra poverty line is estimated at RS 967 per capita per month in rural areas. This poverty line is used for this study.

**Table no 2. crossed the poverty line Families of women**

Year	Poverty criterion (Per capita consumption expenditure per month,RS )	Total families	Crossed poverty line Families	Percentage of crossed poverty line Families
2011	967	213	02	0.94

Source :- primary data

Table number 2 shows that, Out of 215 families, only 2 families has crossed the poverty line. The percentage of crossing poverty line is very low. Thus it can concluded that Financial condition improved due to micro finance but it is not able to cross poverty line. Microfinance help to improve their economic status but still fails to reduce their vulnerability. Because their main reason is the choice of dairy and goat farming business in primary sector. Therefore, to make Micro Finance programme more effective, there is a need to emphasize on business selection in second and third sector.

## **ADVANTAGES AND DISADVANTAGES OF GST**

**Dr.Deepa Kailas Holkar**

*Late BRD Arts & Commerce Mahila Mahavidyalaya, Nashik Road*

**Introduction** – The Country witnessed the launch of biggest ever tax reform since independence on the intervening night of 30<sup>th</sup> June – 1<sup>st</sup> July 2017 Speaking on the occasion. The Prime Minister said that the day, marks a decisive turning point in determining the future course of the country tall. Status are slated to gain immensely as they will now get equal opportunities of development. The system not only provides impetus to already developed states but also provides the opportunity to the backward states to develop. In his inspirational speech at mid night of June 30, minutes before the roll out, Prime Minister, referred to GST as a life changing instrument for the poor particularly in eastern Uttar Pradesh, other eastern states and the North East. Even as they are blessed with rich natural resources these states have not been able to fully exploit the same for their development, How it is Possible.

### **Advantages of GST**

- 1) **Eliminate Multiple Taxes System** – This is one of the advantage of GST System. It eliminates all different types of taxes (Sale Tax, Service Tax, Excise Duty, Octroi, Central Sales Tax and Value added Tax etc.) The idea behind the implementation of GST was subsume all existing taxes of the State and Centre Government under one value added tax. Which would be levied on all goods and service. No good or service would be exempt and also there would not be any differentiation between goods or services. This rule would apply to both input and output product. The tax paid on input tax would be deducted from the tax paid on the output produced and it continuous from manufacturing stage to the distribution stage. Tax would be collected only at the place of consumption. This system of tax addresses the issue of cascading of taxes.
- 2) **No Interfearce of bureaucvacy** – All the compliance procedures under GST Registration , payments, Refunds and Returns will now be carried out through online portals only and thus small and medium Enterprises need not worry about interacting with department officers for carrying these compliances.
- 3) **Production Cost is less** – One nation one tax system is very important tax system in India. It's very easy to extend business in other state without paying interstate taxes. It provides the national platform.
- 4) **Simple and easy procedure**- The entire process of GST (form registration to filling returns) is made online and it is simple they do not have to run from pillar to post to get different registrations.
- 5) **Economic Growth** – Government revenues should rise as the simplicity of Paying tax is an incentive to do so rather than avoid levies and finally the ease of doing business will improve which should in turn lead to move investment and there by give a push to economic growth.
- 6) **Improved efficiency of logistics** – The logistics industry in India had to maintain multiple warehouses across states to avoid the current CST and state entry taxes on inter state movement. These ware houses were force to operate below their capacity giving opportunity to increased operating costs under GST, however these restrictions on inter state movement of goods have been lessened.
- 7) **Unorganized sector is regulated** – Under GST some of the industries in India like construction and textile industries were largely unregulated. Under GST there are provisions for online compliances and payments and for availing of input credit only. When the supplier has accepted the amount this has brought in accountability and regulation to these industries.

- 8) **Growth of Revenue in State's and Centre** – It is expected that the introduction of GST will expand the tax base but lowers down the tax rates and also removes the multiple point. This will lead to higher amount of revenue to 60<sup>th</sup> the states and centre.

**Disadvantages of GST**

- 1) **Challenge to small and medium enterprises (SMES)** – As well the India's GST System stations the small and medium enterprises (SMES) and large scale Industries at the same level by keeping the exemption brink very competitive without any tax disparity. There is a task ahead for SMES to be able to invest, change and read in the way similar to large scale players.
- 2) **Increased Costs due to requirement of software** – Online registrations, Electronic refund procedures and returns are required to be filled electronically and input tax credit and tax liability adjustment will happen automatically on the basis of these returns, Business have to either update their existing accounting for ERP software to GST or GST software. So that they can keep update. But both the options lead to increased cost of software purchase.
- 3) **SMES will have a higher tax burden-** Manufacturing sector will face difficulties under GST. Earlier only businesses whose turn over exceeded RS. 1.5 crore had to pay excise duty but now any business whose turn over exceeds Rs.20 lakh will have to pay GST.
- 4) **Financial Services cost will increase** – In most of the countries GST is not charged on the financial services under the services tax. India has followed the approach of bringing virtually all financial services within the ambit of tax. Where consideration for them is in the form of the explicit fee, GST also include Financial services on the above grounds only.
- 5) **Tax Managements and infrastructure's cost will high** – Success of any tax reform policy or managerial measures depends on the inherent simplifications of the system. Which leads to the high conformity with the administrative measures and policies. It depends on the states and the centre, how they are going to make GST a simple one.

GST is recognized to be a smooth tax collection system regardless of teething troubles in the preliminary implementation provide change is not accepted easy. It is important task to go with the positive change.

**Introduction:** Finance is a blood for economy of the Nation. It proves as elixir to the economy if proportionate and proper dose of FDI is given at proper time. If observation is made as regards the history of developing and developed country, they always take risk in inviting and raising FDI for their self-development. European countries as well as China, Taiwan, Singapore etc., are good examples for taking shelter of Foreign Direct Investment and raise their economic prosperity. Any nation cannot develop itself, unless there is cooperation and helping hand from other nations. Push up is always necessary for taking jump towards the progress and economic development. Modern Commerce always upholds the theory of specialization. Self-reliance has its limits. It shrinks the development of the nation. As compared to other East Asian countries, India is a latecomer to FDI scene. Developing country always in need of FDI to boost up its economy to bridge the gap of saving and investment.

**About FDI:** Foreign Direct Investment is defined as Investment by non-resident entity/person resident of outside India, in the capital of an Indian company under schedule one of Foreign Exchange Management ( Transfer or Issue of Security by a person resident outside India) Regulation 2000. IMF defines FDI as "Investment that is made to acquire a lasting interest in an enterprise operating in an economy other than that of the investor. The investor's purpose being to have an effective voice in the management of the enterprise (IMF 1977). FDI refers to an investment in foreign country that involves some degree of control and participation in management. The FDI corresponds with the investment undertaken by a multinational enterprise in a foreign country. It should not be misconstrued with portfolio investment, which is motivated by profit through financial investment and does not seek management control. FDI further may be distinguished into 1. Horizontal Foreign Investment  
**2.Vertical Foreign Investment:** In horizontal Foreign Investment, the investor invests his capital in foreign company producing the product which is produced in his home country. In vertical Foreign investment, there are two types namely backward vertical investment and forward vertical investment. Backward Vertical Investment implies that the firms directly invest in a foreign country to produce intermediate goods that meant to be used as inputs in its domestic production process. Forward Vertical Investment implies that the firm invests in a foreign country in producing the final stage goods or assembly of the product to market it directly to the foreign buyers. There are two categories of investment, direct investment and portfolio investment. Direct Investment implies that investment is followed by control. It implies an ownership share of at least 10 or 25% share, otherwise, it is considered as portfolio investment and which is solely motivated by profit through financial investment.

**History:** India has historical background relating to FDI. From an ancient period, trade was established between India and surrounding countries. In mediaeval period, Dutch, French, British from Europe, established their colonies in India. They invested their brain and capital and founded the companies in India. Indians also exported their goods to the other countries. This is a good example of Foreign Direct Investment. In that period there was no any strong mechanism based on legalisation as like present scenario. Globalization is the main concept and this concept comprises the concept of FDI. In my opinion FDI is a mean to materialize globalization.

**FDI and India:** After getting independence to India, India adopted five year plan strategy to get it developed systematically. In addition to that it accepted the constitution stressing on democracy, Equality, Socialism and Secularism. India rejected communism as well as capitalism and adopted socialism because it is a golden mean of these two theories. Nearly 150 years India was under the rule of British. In this long period, India was robbed completely and devoid of its economic and cultural prosperity. Under the British rule, India's share of the world economy declined from 24.4% in 1700 down to 4.2% in 1950. India's GDP (PPP) per capita was stagnant during the Mughal Empire and began to decline prior to the onset of British rule. In this reference, Dr. Manmohan Singh in his article mentioned that "There is no doubt that our grievances against the British Empire had a sound basis. As the painstaking statistical work of the Cambridge historian Angus Maddison has shown, India's share of world income collapsed from 22.6% in 1700 to as low as 3.8% in 1952. Indeed, at the beginning of the 20<sup>th</sup> century "The brightest jewel in the British Crown" was the poorest country in the world in term of per capita income. It is the reality and it was painful and hurting to the people of India and political leaders of that time. Socialism is the panacea to solve the problems of casteism, poverty, regionalism and inequality. This is the firm belief of Nehruism and Gandhism. Therefore, India came closer to Russia and went away from America, two superpowers ruling the world.

**Economic Position of India from 1947 to 1991:** At the time of independence, the attitude towards foreign capital was one of fear and suspicious. This was a natural one on account of the previous exploitative role played by it in draining away resources from this country. The suspicion and hostility found expression in the Industrial Policy of 1948 which, though recognising the role of private foreign investment in the country emphasised that its regulation was necessary in the national interest. Because of this attitude expressed in the 1948 Resolution, foreign capitalists got dissatisfied and as a result, the flow of imports of capital goods got obstructed. As a result the prime Minister had to give following assurance to the foreign capitalists in 1948.

1. Government cannot discriminate between foreign and Indian capital. Equal treatment be given.
2. Government can minimise the restriction on earning profit.
3. If and when foreign enterprises are compulsorily acquired, Government will pay compensation on fair and equitable basis.

Despite the assurance by the government, there was no positive response given by Foreign Investors. Until 1991, Indian government was very conservative and cautious to allow to enter the foreign capital in many fields. Five year plans of India resembled central planning in the Soviet Union. Steel, Mining, Machine Tools, Telecommunication, Insurance were effectively nationalised in mid-1950. In 1969, Fourteen largest Commercial banks were nationalised. These banks contained 85 % of bank deposit in the country. Generally, The government of India tends to hold the control over the basic and fundamental sectors in their hand. As much as possible, the foreign capital be avoided is the mentality of the Indian government.

The period from 1989 to 1991 was critical in India's economic career. India was on the verge of bankruptcy. By 1985, India had started having balance of payments problems. By the end of 1990, it was a serious economic crisis. The government was close to default, Its central bank had refused new credit and foreign exchange reserve had been reduced to such a point that India could barely finance three weeks' worth of imports, which led the Indian government to airlift national gold reserves as a pledge to the International Monetary Fund (IMF) in exchange for a loan to cover balance of payment debt. This situation was crucial signalling "DO or DIE" for India. That time Prime Minister Narshiarao and Finance Minister Dr. Manmohan Singh these two personalities were the architect of giving shape to India's economy. They opened up the door of Indian economy to Foreign Capital. LPG was the buzz

word for India. LPG means Liberalization, Privatization and Globalization. In this context, situation of adjacent countries are to be observed. Four Asian Tigers, Hong Kong, Singapore, South Korea and Taiwan, which underwent rapid industrialisation and maintained exceptionally high growth rate in excess of 7% a year between early 1960 and 1990. By the early 21<sup>st</sup> century, all four had developed into advanced and high income economies, industrialised developed countries, specialising in areas of competitive advantage. Hong Kong and Singapore have become world leading international financial centres. Whereas South Korea and Taiwan are world leaders in manufacturing information technology. Their economic success stories have served as role models for many developing countries. China also opened its economy in December 1978. Japan, Hong Kong, Taiwan, South Korea are the neighbouring countries of China, were making rapid development in their economy. On the contrary, China's position was difficult. Citizens of China had to make do with barely sufficient food supplies, rationed clothing, inadequate housing and service sector that was inadequate and inefficient. These entire shortcomings embarrassed China internationally. It is very important to consider the reasons and principles behind adopting the reform program in economy is not to abandon communism but to make it work better by substantially increasing the role of market mechanisms in the system and by reducing not eliminating government planning and direct control.

**Some important measures announced for promoting foreign investment in post – reform period (i.e. the period since 1991)**

1. In 1991, Government announced specified list of High technology and high investment priority industries. Wherein automatic permission was granted for FDI up to 51 per cent. Limit was raised from 51 to 74 and subsequently to 100 per cent and many new industries have been added in the list.
2. Empowered Board has been constituted to negotiate with a number of large International Firms.
3. Hiring of foreign technicians and testing of indigenously developed technology abroad earlier required case by case approval by Government. This involved unavoidable delay. This requirement has been waived and thus no permission is now required for this purpose.
4. To hasten the progress in the ailing power sector, the government allowed 100 per cent foreign equity for setting up power plants.
5. NIR Investment up to 100 % equity is allowed in export house, trading house, star trading house, hospitals, EOU's, sick industries hotels etc.,
6. Foreign Citizens of Indian Origin are now permitted to acquire house property without permission of Reserve Bank of India.
7. Foreign Companies have been allowed to use their trade mark on domestic sales.
8. 100% FDI is permitted in oil refilling
9. 100% FDI permitted for Business to Business e-commerce.
10. The defence industry sector has been opened up to 100 per cent for Indian private sector participation with FDI permitted up to 26 per cent, subject to licensing.

**Evaluation of FDI, GDP in India during 1991 to 2011-2012.**

The following table shows the position of FDI inflow and its impact on GDP.

FDI inflow , GDP and FDI/GDP Ratio in India (1991-92 to 2011-12)	FDI Inflow (in rupees crore)	Growth rate of FDI Inflow (%)	GDP	Growth rate of GDP (%)	FDI as a percentage of GDP

Year					
1991-92	409	-	1099072	-	0.037213
1992-93	1094	167.4817	1158025	5.363889	0.09471
1993-94	2018	84.46069	1223816	5.681311	0.164894
1994-95	4312	113.6769	1302076	6.394752	0.331163
1995-96	6916	60.38961	1396974	7.288207	0.49507
1996-97	9654	39.58936	1508378	7.974665	0.640025
1997-98	13548	40.33561	1573263	4.301641	0.86114
1998-99	12343	-8.8943	1678410	6.683371	0.735398
1999-00	10311	-16.4628	1786525	6.441513	0.577154
2000-01	12645	22.63602	1864301	4.35348	0.67827
2001-02	19361	53.1119	1972606	5.809416	0.981494
2002-03	14932	-22.8759	2048286	3.836549	0.729
2003-04	12117	-18.8521	2222758	8.517951	0.545134
2004-05	17138	41.43765	2388768	7.468649	0.717441
2005-06	24613	43.61652	3254216	36.22989	0.756342
2006-07	70630	186.9622	3566011	9.581263	1.980644
2007-08	98664	39.69135	3898958	9.336679	2.530522
2008-09	122919	24.58343	4162509	6.759524	2.953003
2009-10	123378	0.373417	4493743	7.957556	2.745551
2010-11		88502		-28.2676	
2011-2012		173947		96.5458	
total		577002		42598695	

The above table shows the FDI inflow and GDP in India from the year 1991-92 to 2011-2012. The table states that India had showed a large amount FDI inflow. It showed that FDI inflow has been increased from Rs. 409 crore in 191-92 to Rs. 173947 crore in 2011-2012. Due to technological up gradation , access to global managerial skill and practices, optimal utilization of human and natural resources , making Indian economy internationally competitive , opening up export markets, the Indian Government has used many steps to attract more FDI.

#### **FDI policy 2017 of the government of India,**

- 1.DIPP allowed 100 % FDI in Defence Sector where up to 49% is permitted under the automatic route and beyond 49% is permitted under the government route.
- 2.The sectorial cap in broad casting carriage services such as Telephones, DTH Cable Networks (Digital) Mobile T.V, HITS has been raised from 49% to 100% automatic route.
- 3.With a view to aid in modernization of the airports to establish a high standard , 100 FDI under automatic route has been permitted.
4. 100% FDI under automatic route is permitted in respect of Food Products, manufactured and /or produced in India.

5. The FDI policy 2017, permits 74% FDI under automatic route in brownfield Pharmaceuticals and beyond 74% will be permitted through Government approval route.

After taking review of the Government policy in respect of FDI Government is becoming more liberal and many sectors which are reserved for government control are being opened for FDI. Reason behind this is growth, up gradation and development.

#### **Benefits of FDI**

FDI with sense of responsibility and control is always beneficial as it increases

1. Employability
2. Infrastructure facility
3. Skill and knowledge
4. Speed of Industrialization
5. Strength of Economy
6. Co-operation among Nations
7. Peace and stability
8. Good relationship
9. Interdependence
10. Specialisation

**Conclusion:** Opening any Nation's economy for Foreign Direct Investment is one of the way to make the progress of that nation in various fields. Focus is given on economic progress however, in addition to that, simultaneously various fields are also developed. Namely, Art, Civilization, Education, Culture, Ethics etc., Besides exchange of finance, the people of the two nations come together and they learn a lot of things from each other's. Dialogue, communication takes place very smoothly, continuously and without any barrier. Wall of enmity, alienation or estrangement is collapsed. Environment of friendship, fraternity, cooperation is developed and it creates the surest and solid foundation for peace and sustainable development of world. Advantages come with disadvantages. This is a law of Nature. To avoid these disadvantages, sense of consciousness, foresightedness and control is to be adopted. Briefly, Line of control is to be respected and maintained very carefully as regards FDI. China is the role model for India in respect of following the policy of FDI. Our Prime Minister Mr. Narendra Modi defines FDI as FIRST DEVELOP INDIA. This is very meaningful definition of FDI for India to maintain our Indigenesness along with development and prosperity.

## **SOCIO-ECONOMIC IMPACT OF IMPLEMENTATION OF IAY IN WESTERN VIDARBHA**

**Dr. Ashish Sudhakar Rao Nimkar<sup>1</sup> & Dr. S.S. Naik<sup>2</sup>**

<sup>1</sup>*Researcher*

<sup>2</sup>*Research Guide, HOD of Economics, GVISH, Amravati.*

**Introduction :-** Housing requirement is one of the most essential thing for every citizen. Owning of house provides significant in social and economic security and status for a shelterless person. A house brings a profound social change in personal existence. After the partition, government incepted housing programme for the rehabilitation of refugees. Near around 1960, Approximately government provide 5 lakh families houses in various area of Northern India. The community development movement in 1957 and the Estimate committee of the lok Sabha in 1972-73 pointed need of shelter because in that period 83% population was living in villages, and about 73% of the rural population resided in kutchha structure houses, then government provided keen attention toward housing problems and launched construction, Assistance Scheme in forth five year plan by the recommendation of National development council. Scheme was transferred to the state sector from 01 march, 1974. The origination of Indira Awas yojana can be traced in National Rural Employment programme (NREP) in 1980 and the Rural Landless Employment Guarantee Programme (RLEGP) in 1983. In June, 1985 that Indira Awas Yojana was launched as a sub-scheme of RLGP by earmaking a part of the fund for construction of houses for SCs/STs and freed bonded labours. When Jawahar Rozgar Yojana (JRY) was launched in April, 1985 6% of fund was allotted for housing for the SCs/STs and freed bounded labours. In 1993-94 the coverage was extended to non SCs/STs. IAY was delinked from JRY and made an independent scheme with effect from 1<sup>st</sup> January, 1996 under the Ministry of Rural Development with the larger strategy of rural development and rural poverty eradication. In 1999-2000 numbers of changes accepted in IAY improve the scheme like change in structure, disaster resistance houses and use environment friendly technology. Since suggestions of Empower Committee (2013) and National Taskforce on rural Housing (2014) effective improvement has taken up for implimentation of IAY. From 1<sup>st</sup> April, 2016 IAY scheme was converted in Pradhanmantri Awas yojana-Gramin (PMAY-G) to achieve the objectives of 'Housing for All' By 2022.

**Socio-economic development :-** Socio-economic development is the process of social and economic reforms in society. Each and every nation gives emphasis to makes a social-economics development of its population. Socio-economic development is measured with many indicators such as life expectancy, literacy level, personal dignity, personal safety, and the extent of participation in civil society and also GDP and level of employment, since the Independent Socio-economic development of the country has always remained a cherished goal before the government. So that government decide to Implement five year plan, and each five-year plan planners trying to emphasis in different components of the growth strategy. Although various efforts have been taken for the development of the country right from the day the country became independent, It is since 1991 that India has emerged as one of the fastest growing economies in the developing world, and its all credits goes to Implementation for various anti poverty programmes in India it can reduce poverty level 36.00% (1993-94) to 21.90% (2011-12) and opens many ways of social-economic development of below poverty level population.

### **Objective of Research :**

1. To study the impact of Implementation of IAY on eradication of poverty in western vidarbha.

2.To focus on the socio-economic aspect of the IAY beneficiaries in western vidarba.

**Study approach & Methodology :-** Amravati revenue division means western vidarba region of Maharashtra, has been selected for the present study. Although five districts which are Amravati, Akola, Buldhana Yeotmal & Wasim included in western vidharba but researcher selected 60 beneficiaries' as a sample for this research work through these five districts.

The study is based on descriptive type of research and it is based on primary and secondary data. Primary data is collected through a field survey in the study area. A structured interview scheduled used for collection of primary data. Secondary data are collected from various books, journals, reports and related department website and collected data represented with the help of Tabulation method.

**Expenditure review of IAY :-** In given table presenting target achievement and expenditure of indira awas yojana (IAY) last ten years. All figures are sum of five district which are part of westem vidarbha.

**Table No.1**

Year	Target	Achievement	Expenditure (Lacks rupees)
2005-06	5,343	4,427	1,261.68
2006-07	8,985	10,026	2,857.7
2007-08	9,068	11,934	5,191.28
2008-09	10,931	14,156	6,157.85
2009-10	10,726	20,339	8,848.45
2010-11	15,566	15,326	10,498.29
2011-12	7,193	13,219	9,055
2012-13	12,110	15,517	15,252.89
2013-14	17,868	19,480	1,7841
2014-15	21,985	34,620	3,2889
Total	1,19,775	1,59,044	1,09,853.14

(DRDA- Amravati, Akola, Buldhana, Yeotmal, Washim)

In Table 1 indicates that Rs. 1,09,853.14 Lakhs has been expenditure under IAY in Western Vidarbha from financial years 2005-06 to 2014-15. Amongst all these financial years 1,19,775 Houses were proposed to be constructed by DRDA of five districts of the region (Amravati, Buldhana, Akola, Yeotmal and Washim) and achievement was 1,59,044 i.e. 32% more than the targeted values.

**Socio-economic impact of IAY in western vidarbha :-**

**Table 2**

Beneficiaries pre stage of benefit

Stage	Homeless	Kuchha	Semi Kuchha
Total	07	35	18
percentage	11.67	58.33	30.00

Overall 60 beneficiaries were surveyed, out of which 35 (58.33%) beneficiaries were having their own houses either in Kutchha or in dilapidated condition, while as 07 (11.67%) beneficiaries were

homeless. Thus the  $\chi^2$  Test evaluation value of IAY Scheme beneficiaries proved to be more than the table values. Thus the houses constructed under IAY scheme have certainly played significant role in improving financial and social status of beneficiaries.

**Table 3**

Social Category of beneficiaries

Category	SC	ST	Minority	Non SC/STs	Freed Bonded	Others
Total	22	23	00	15	00	00
percentage	36.67	38.88	00.00	25.00	00.00	00.00

Out of surveyed beneficiaries 23 (38.88%) were from ST category, while as 22 (36.67%) were included in SC category and remaining 15 (25.00%) beneficiaries were beyond Non SC/ST. Thus the  $\chi^2$  Test evaluation value of IAY Scheme beneficiaries proved to be more than the table values. Thereby this scheme is proving helpful to all beneficiaries coming from SCs/STs and also Non SC/ST categories in providing homes under IAY projects.

**Table 4 Beneficiaries Opinion about housing grade**

Housing grade	Admirable	Good	General	Degrade	Over degrade
Total	07	26	20	05	02
percentage	11.67	43.33	33.33	08.34	03.33

When quality of homes constructed under IAY project was considered 26 (43.33%) beneficiaries appreciated to be good, while as only 2 (03.33%) beneficiaries did not approve the quality of construction and graded it to be over degrade. Thus the  $\chi^2$  Test evaluation value of IAY Scheme beneficiaries proved to be more than the table value. And the opinion of beneficiaries about the quality of homes seemed to be noticeable as regards statistical evaluation of homes under IAY scheme.

**Table 5 IAY Impact on beneficiaries life style.**

Impact	None	Little Proportion	Upgrade social status	Upgrade Life expectancy	Upgrade confidence
Total	11	28	09	03	09
percentage	18.33	46.67	15.00	05.00	15.00

When impact on life style of beneficiaries of IAY were studied through surveys by interviews of the beneficiaries. It was recorded to be having general impact on life styles by 28 (46.67%) beneficiaries, while as 11 (18.33%) have commented not to have any impact on their life style, while as 09 (15.00%) beneficiaries have admitted to have escalated their life style remarkably, and remaining 03 (05.00%) recorded to have improved their self confidence due to homes under IAY. Thus out of 60 beneficiaries 49 (81.67%) beneficiaries have appreciated the positive impact on their life styles due to allotted homes under IAY scheme.

**Table 6 Classification of Housing Structure**

Housing Structure	Ordinary	Convenient	Inconvenient
Total	42	10	08
percentage	70.00	16.67	13.33

As regards designing factor of homes constructed under IAY scheme 42 (70.00%) beneficiaries have found the architecture of their homes to be average, while as 08 (13.33%) beneficiaries admitted their homes not suitable for routine living standards. Thus the  $\chi^2$  Test evaluation value of IAY Scheme

beneficiaries proved to be more than the table value. And the opinion of beneficiaries about the designing of homes seemed to be noticeable as regards statistical evaluation of homes under IAY scheme.

**Findings :-**

Indira awas yojana is the biggest and most comprehensive rural housing programme ever taken up in the country. About Implementation of this Scheme some findings of study are given below.

1) Due to execution of IAY scheme for providing homes to rural population, the beneficiaries found it that by availing such homes the life style of rural population seemed to have improved their life style and to have supported for upgradation of their social status.

2) The average beneficiaries seemed to have been coming from SC and ST Categories of the society, thereby the deprived class of society have been noticed to have been benefited under IAY scheme.

3) The beneficiaries of IAY scheme have recorded the allotted homes to them to be of general standard by majority (55%), while as (45%) beneficiaries did not approve the quality of homes to be sub-standard, below dignity or poor quality. Thus there is lot of scope for improving quality of construction of such homes.

4) IAY scheme seemed to have been helpful in improving life style of rural population and to have compounded their self confidence. Thus motto of this Government IAY scheme to bring the rural natives under main stream of development of India seemed to have succeeded to certain extent.

5) There is lot of scope in designing infrastructure in erecting homes to rural population to serve a lot to provide sufficient light, air and parking space anticipated to provide the elegant life style to even rural population of India.

**Conclusion :-** Housing is the fundamental need of human being it is basic requirement for human survival. Basically housing is not individual requirement it is for the community, because human is social animal he can't live without society and house makes the society stable. Houses provide shelter from the elements of nature, privacy and protection from the hustle and bustle of the external world. Houses utility not limited to shelter its beyond mere shelter. Every one desires a home for delightful family life, to improve life style and standard of life. Own house makes self-esteem and confidence. A home contribute significant role in social economic development of human and promote social integration.

## **DEMONETIZATION & GST – BITTER MEDICINE FOR HEALTHIER INDIA**

**Dr. Rajesh Mankani**

*B'Com, DSM, MBA (HR), LLB, PhD (Management), Faculty: Lala Lajpatrai College of Commerce & Economics, Mumbai. Visiting Faculty in Management/HR/Family Managed Businesses Corporate Trainer & Management Consultant*

**I. INTRODUCTION:** It has almost been a year since Prime Minister Narendra Modi, in a late evening broadcast to the nation, invalidated Rs 500 and Rs 1,000 notes. The idea was to attack black money and fake currency which were used to finance terrorism. As the press release accompanying the demonetisation decision put it: "Use of high denomination notes for storage of unaccounted wealth has been evident from cash recoveries made by law enforcement agencies from time to time." You don't need to be an economist to realize that if the bulk of currency in a country where transactions are largely carried out in cash (80 to 98 percent, depending on which estimate one takes), is suddenly invalidated, the results will largely be disastrous, a few benefits here and there, notwithstanding. The costs imposed by the currency-scraping exercise were, quite severe, at least in the short term, disrupting ordinary life across the country for several weeks. The hardest-hit were those in rural areas, where access to banking and the internet are quite low. The middle & lower strata of the country faced massive problems in carrying out their day-to-day subsistence, while the upper strata faced the massive problem of scurrying to convert stashes of black money into white currency. For which, numerous, ingenious methods were used to find a loophole wherever possible in the government's diktat of limited acceptance of the old currency. Today, after almost a year of one of the biggest fiscal steps in Indian history, while the country is still coming to terms with the impact of the huge step, analysts are trying to still figure out whether it has been a boon or a bane for the Indian economy. Majority of the analysts have been openly bashing the move and also disapproving the Modi government's resolve to clean India of the widespread corruption (at least the intentions appear to be so). Hardly having caught some breath after the huge inferno called 'Demonetization', the Modi government has unleashed another weapon of mass destruction on the Indian public in the form of GST. GST has again become a talking point and much has been said and discussed and prophesized about what kind of impact it will have on India and its citizens. Although still in its baby-steps, GST has caused a huge financial and political turmoil.

**II. SCOPE & OBJECTIVES OF RESEARCH:** While both the steps of Modi government have received huge flak and more of the negatives are being tom-tomed, the researcher believes that the moves are well intentioned and deserve credit. If implemented as intended, with all honesty, these can in fact be the means to accelerate India's growth exponentially in the coming decade to occupy the top echelons of the world's economic superpowers. The main objectives of this study are as follows:

- a) To understand & look at the positives of Demonetization
- b) To understand how it can help India in its drive for faster growth
- c) To understand how, coupled with GST, the government can use these as the carriers to propel India into the next decade as one of the economic superpowers

### **III. RESEARCH METHODOLOGY**

This paper is based on secondary data collected from internet, books, magazines & journals.

**IV. DISCUSSION:** Many tons of newspaper reams have been consumed in writing about the adverse impact of demonetisation introduced on 8 November 2016. One of the most glaring short-term evidence of which was the 130 basis point fall in India's GDP growth to 6.1% for the January to March 2017

quarter (the first full quarter after demonetisation and enough to assess its impact economically) from 7.4% in the previous October to December 2016 quarter, and 7.6% in the same quarter of the previous year. Although a quarter is no indicator of rankings but within the confines of statistics, the quarter also saw India relinquish its position of being the world's fastest-growing large economy to China, which grew by 6.9% in the same period. Six months later, while aggregate numbers are still not out, and the old Rs 500 and Rs 1,000 notes returned to the banking sector still being counted by the Reserve Bank of India (RBI) - creating more negative speculation than mere numbers - there are cases by the dozens being reported, followed, prosecuted and arrested, and the modus operandi of tax evaders being analysed. According to an analysis by the Income Tax Department, of the 1.8 million persons identified for verification, taxpayers provided 1.3 million accounts involving cash deposits of Rs 2.89 lakh crore. The numbers have been coming fast & furious and it has become difficult to freeze on the exact number of evaders and the exact amounts recovered from them. Further, since demonetisation, we have seen the number of taxpayers rise by 9.1 million, according to finance minister Arun Jaitley. This is a great start, the trend of which we expect to continue over the next few quarters. The policy of converting demonetisation into a tool for increasing taxpayers is working, and the moral messaging embedded in the policy - cash is a risky associate - is getting through to the habitual evaders. "One message has gone out clearly as per the steps taken by CBDT post demonetisation," Jaitley said. "It is no longer safe to deal with excessive cash and tax evaded money. It is absolutely clear that those who have been indulging in all these are no longer safe." The government has taken the aid of cutting edge technology by way using big data analytics in its endeavour to clamp down on evaders and improve the overall system and make it more transparent. If technology and data analytics has delivered results, both financial and moral, around demonetisation and direct taxes, the GST goes one step ahead on the GST and indirect taxes front. Here, the linkages of databases, big and small, through technology that is wired into the Goods and Services Tax Network (GSTN) is embedded into the very conceptualisation, construction and execution of the policy. The entire system is electronic. Incentives have been created to ensure compliance - one entity cannot get tax credits if the previous entity does not pass it. Although the hard and almost unrelenting compliance could be harsh on the technologically-challenged, the Indian entrepreneur is smart enough to learn. Other issues like electricity or broadband availability is being addressed through GST Suvidha Providers. It is a clean system, the benefits of which will show up in the last quarter of FY 2018 Those who said the GST system will collapse under the weight of transactions as it comes to life on 1 July, have been proved wrong beyond doubt. The GST takes India to a more efficient, cleaner and less stressful tax system. But as has been expressed here earlier, the next two quarters, from July to December 2017, the transition to GST will extract a price. And that price will be in the form of a slower GDP growth. This will be the bitter medicine being administered, which on successful entry into the body of the economy, will lead to stability of the GST system in the January to March 2018 quarter, after which the recovery will be quick. This will be due to a rise in the number of taxpayers as well as the amount of taxes that were so far being evaded - on indirect taxes of course, but on direct taxes as well.

**V. OUTCOME:** The Indian economy is heading towards a unique trajectory — bitter over the next two quarters till end-2017, sweet beyond that — that will capture the following:

- 1) Growth of gross domestic product (GDP) will decrease in the short term and make up in the medium to long term
- 2) Growth of tax collections, both direct and indirect, will increase in the short term and consolidate itself to a new normal in the medium and long term.

- 3) As a result of the above, the tax-GDP ratio will jump in the short term and show a consistent but slower rise beyond that
- 4) By FY 2019 — around the time India will go for general elections — the government will be acting from a position of a full treasury
- 5) That growing treasury will give the government a fiscal flexibility that no other government would have seen

These are consequences of two disruptive policy actions — demonetisation and the introduction of the goods and services tax (GST) — both of which lead the economy in the same direction. The medicine, as always, may be bitter to swallow and show harsh initial reactions, however, in the long run, it is bound to provide immense relief to the economy. The medicine in a modern economy is to target, through the use of sophisticated tools – technology drivers, global equalizers, international learning, cost-benefits, and reignited political motives - and deliver large-scale economic goals, individually or severally. In this process, from objectives to execution, governments are ready to accept short-term losses for a bigger and grander long-term objective. Both demonetisation and the GST are part of this cycle of swallowing a bitter pill for long term relief from dreaded disease.

The next three quarters, from April to December 2018, will see the treasuries of both the Central and State governments fill up. On the Central side, this will give the government at the centre the leeway to do three things.

- A) Invest the surplus in further accelerating economic growth by spending on infrastructure - good economics, good politics
- B) Use the extra indirect taxes collected to reduce individual income taxes - good politics, good economics.
- C) Loose the edge gained by giving it away on entitlements like introducing the universal basic income - good politics, bad economics.

This would come at a time when India would have shifted from a fiscal year that begins on 1st April to a calendar year i.e. 1<sup>st</sup> January, that will bring Indian financial sector in tune with the rest of the world. What all this entails is that, those who are already paying their taxes, direct and indirect, have nothing to fear - nothing changes for them, however those who are not, must pay the penalty for the rest of the people subsidizing their lavish lifestyle.

## **THE GLOBALIZATION AND ITS IMPACT ON UNSKILLED URBAN LABOURS: A STUDY OF NASHIK CITY (MAHARASHTRA)**

**Dr. Vijaykumar Wawle**

*Associate Professor in Economics, Gokhale Education Society's, HPT Arts and RYK Science College, Nashik (S.P. Pune University, Pune)*

**Introduction:** The Challenges of Urbanization in India are expected to accelerate. Urbanization in India has occurred more slowly than in other developing countries and the proportion of the population in urban areas is merely 28 per cent according to the 2011 census. The pace of urbanization is now set to accelerate as the country is growing at a more rapid pace. Economic reforms have already unleashed investments and growth thereby offering its citizens rich opportunities. Surging growth and employment in cities will prove a powerful magnet. 300 million Indians currently live in towns and cities. Within 20-25 years, another 300 million urban labours will be added to Indian towns and cities. This urban expansion will happen at a speed quite unlike anything that India has seen before. It took nearly forty years for India's urban population to rise by 230 million. It could take only half the time to add the next 250 million. If not well managed, this inevitable increase in India's urban population will place enormous stress on the present system. India has not paid systematic attention to urbanization so far The speed of urbanization poses an unprecedented managerial and policy challenge—yet India has not engaged in a national discussion about how to handle the seismic shift in the makeup of the nation. As the urban population and their income increases, demand for every key service such as water, transportation, sewage treatment, low income housing will increase five- to sevenfold in cities of every size and type, and if India continues on its current path, urban infrastructure will fall woefully short of what is necessary to sustain prosperous cities.

### **Review of literature**

- 1. Pranab Bardhan (2010):** In his paper he focused on an analytical account of the mechanisms through which globalization, in the sense of increased foreign trade and long-term capital flows, affects the lives of the poor in developing countries (in their capacity as workers, recipients of public services or users of common property resources).
- 2. Mohankumar and Surjit Singhs'** article analyses the impact of the 2008-09 global economic meltdown on workers in the unorganised sector of the gem polishing and construction industries in Rajasthan. The study finds that the impact of the crisis varied between gem polishing and construction industries and it was more severe for workers in the lowest income group in both industries.
- 3. Srinivasan Ramani** stated that on 12 December 2013, more than a lakh workers predominantly from the unorganised sector marched on Parliament to demand a minimum living wage, social security measures and regularization of work. The call had been given by trade unions across the political spectrum and the participants came from all parts of the country. However, mainstream and popular media remained indifferent and ignored the rally, much like earlier times.
- 4. Srinivasan Ramani (2013)** On 12 December 2013, more than a lakh workers predominantly from the unorganised sector marched on Parliament to demand a minimum living wage, social security measures and regularisation of work.

### **Statement of the problem**

The present study makes an attempt to study the following problems in the light of labour wages in global era.

1. Are the socio-economic characteristics of unskilled labours changed the global era?
2. Are urban unskilled labour wages increased in the global era?

#### **Objectives of the study**

The major objectives of the study are stated below:

1. To study the unskilled labour wages in Urban Area.
2. To study the socio-economic characteristics of unskilled labours.

#### **Methodology of the study**

1. In the first stage secondary data is collected from books, journals, newspapers, publications of the annual reports of NABARD etc.
2. In the second stage primary data is collected from the rural, tribal and urban labourers through structured interview schedules and questionnaires.
3. 100 samples are selected through simple random sampling method from urban area of Nashik which are based on the number of labours from the field of construction and unorganized sectors.

An attempt is made in this section to study if there are any significant differences in the socio-economic characteristics between the urban labours of Nashik city were thoroughly studied.

The following parameters were taken into consideration while carrying out the study i.e. Age group, caste, religion, education, size of family, occupation, average monthly income, housing and landholding. In addition to these, availability of tap water, electricity and toilet facility were also considered.

Information regarding socio-economic conditions of urban labours covered under this study is being presented in the following sections.

Data Analysis

**Table No.1**

#### **Age Composition**

Sr.No.	Age	Frequency	Percentage
1	18-25	61	61
2	26-50	38	38
3	51-65	01	01
4	Above 65	00	00
	<b>Total</b>	100	100

Source Field Work

As per the above table, it is seen that 61% urban labours are from the age group of 18-25, 38% urban labours are from the age group of 26-50, 01% urban labour are from the age group of 51-65.

**Table No.2**

#### **Category Composition**

Sr.No.	Category	Frequency	Percentage
1	SC	71	71
2	ST	23	23
3	OBC	02	02
4	NT	03	03
5	SBC	00	00
6	Open	01	01

	<b>Total</b>	100	100
--	--------------	-----	-----

Source Field Work

It is seen in the above table that 71% urban labours are from SC category, 23% urban labours are from ST category and 01% urban labour are from Open Category.

**Table No.3**

**Religion Composition**

Sr.No.	Religion	Frequency	Percentage
1	Hindu	99	99
2	Muslim	01	01
3	Buddhist	00	00
4	Christian	00	00
5	Jain	00	00
6	Others	00	00
	<b>Total</b>	100	100

Source Field Work

As per the above table, it is seen that 99% urban labours were Hindus and 01% urban labours were Muslims

**Table No.4**

**Education**

Sr.No.	Education	Frequency	Percentage
1	Primary	20	20
2	Secondary	43	43
3	Higher Secondary	17	17
4	Graduates	17	17
5	Post-Graduates	03	03
	<b>Total</b>	100	100

Source Field Work

Above table shows that 20% urban labours have taken primary education, 43% urban labours have taken secondary education, 17% urban labours have taken education up to higher secondary level, 17% urban labours are graduates and 3% urban labours are post –graduates.

**Table No.5**

**Marital Status**

Sr.No.	Marital Status	Frequency	Percentage
1	Married	58	58
2	Unmarried	42	42
3	Widow	00	00
	<b>Total</b>	100	100

Source Field Work

Above table reveals that 58% urban labours are married while 42% urban labours are unmarried.

**Table No.6**

**Size of Family**

Sr.No.	Size of Family	Frequency	Percentage
1	1-3	12	12
2	4	30	30
3	5	21	21
4	6	24	24
5	7	11	11
6	8	02	02
	<b>Total</b>	100	100

Source Field Work

This table shows that 12% urban labours have a family of size 1-3, 30% urban labours have a family of size 4, 21% urban labours have a family of size 5, 24% urban labours have a family of size 6, 11% urban labours have a family of size 7, 02% urban labours have a family of size 08 members.

**Table No.7**

**Type of Family**

Sr.No.	Type of Family	Frequency	Percentage
1	Joint	55	55
2	Nuclear	45	45
	<b>Total</b>	100	100

Source Field Work

As per the above table, it is seen that 55% urban labours live in a joint family while 45% urban labours live in nuclear family.

**Table No.8**

**Occupation**

Sr.No.	Occupation	Frequency	Percentage
1	Service	19	19
2	Labour	25	25
3	Self-Employed	08	08
4	Unemployed	48	48
	<b>Total</b>	100	100

Source Field Work

Above table highlights that 19% urban labours are employed, 25% urban labours work as labours, 08% urban labours are self-employed while 48% urban labours are unemployed.

**Table No.9**

**Ownership of House**

Sr.No.	Owner of House	Frequency	Percentage
1	Yes	72	72
2	No	28	28
	<b>Total</b>	100	100

Source Field Work

As per the above table, it is seen that 72% urban labours possess owned residence while 28% urban labours do not own a dwelling place.

**Table No.10**  
**Condition of House**

Sr.No.	Condition of House	Frequency	Percentage
1	Kaccha(Not constructed)	56	56
2	Pakka(Constructed)	42	42
3	Hut	02	02
	<b>Total</b>	100	100

Source Field Work

As per the above table, it is seen that 58% urban labours live in Kaccha houses and only 42% urban labours are benefitted with the housing scheme of state and central government of India.

**Table No.11**  
**Number of Rooms**

Sr.No.	No. of Rooms	Frequency	Percentage
1	1-2	71	71
2	2-4	27	27
3	4-5	01	01
4	Above 5	01	01
	<b>Total</b>	100	100

Source Field Work

The above table shows that 71% urban labours live in a houses having 1-2 rooms, 27% urban labours live in houses having 2-4 rooms, 01% urban labours live in a houses having 4-5 rooms and 01% urban labours live in a houses which have more than 5 rooms.

**Table No.12**  
**Agricultural Land Ownership**

Sr.No.	Agricultural Land Ownership	Frequency	Percentage
1	Yes	04	04
2	No	96	96
	<b>Total</b>	100	100

Source Field Work

This table reveals that only 04% urban labours have owned agricultural land while 96% urban labours do not own agricultural land.

**Table No.13**  
**Size of Agriculture Land**

Sr.No.	Size of Agriculture Land	Frequency	Percentage
1	1 Acre	02	02
2	2 Acre	01	01
3	3 Acre	01	01
4	4 Acre	00	00
5	No land	96	96
	<b>Total</b>	100	100

Source Field Work

As per the above table, it is seen that 02% urban labours own 1 Acre land, 01% urban labours own 2 Acres of land; other 01% urban labours own 3Acres of land while 96% urban labours do not own agricultural land.

**Table No.14****Monthly Income of Family**

Sr.No.	Monthly Income of Family (in Rs.)	Frequency	Percentage
1	1000-2000	14	14
2	2000-3000	31	31
3	3000-5000	20	20
4	5000-10000	18	18
5	10000-20000	20	20
6	Above 20000	07	07
	<b>Total</b>	100	100

Source Field Work

This table highlights that 14% urban labours earn Rs.1000-2000 per month, 31% urban labours earn Rs.2000-3000 per month, 20% urban labours earn Rs.3000-5000 per month, 18% urban labours earn Rs. 5000-10000 per month, 20% urban labours earn Rs.10000-20000 per month and 7% urban labours earn above Rs.20000 per month.

**Table No.15****Persons Working in Family**

Sr.No.	Persons Working in Family	Frequency	Percentage
1	1-2	85	85
2	3-4	13	13
3	4-5	02	02
4	Above 5	00	00
	<b>Total</b>	100	100

Source Field Work

As per the above table, it is seen that 85% urban labours live in a family where 1-2 persons earn, 13% urban labours live in a family where 3-4 persons earn, 02% urban labours live in a family where 4-5 persons earn. In other words, this table highlights that most of the family members are dependent on working members.

**Table No.16****Technical Training for Employment**

Sr.No.	Training	Frequency	Percentage
1	Computer	06	06
2	Typing	06	06
3	ITI	05	05
4	Other	11	11
5	No training	72	72
	<b>Total</b>	100	100

Source Field Work

As per the above table, it is seen that 06% urban labours are trained in computers, 06% urban labours are trained in Typing, 05% urban labours have completed training at ITI, 11% urban labours have done other technical courses while 72% urban labours are not technically trained, hence they (72% mentioned above) are ineligible for employment in various sectors.

**Table No.17****Working Hours as Labour**

Sr.No.	Working Hours	Frequency	Percentage
1	1-5	14	14
2	5-10	32	32
3	10-15	09	09

	Total	100	100

Source Field Work

As per the above table, it is seen that 18% urban labours have the facility of telephone while 82% urban labours do not, 72% urban labours have facility of Television while 28% urban labours do not, 74% urban labours have facility of mobile while 26% urban labours do not, 38% urban labours have the

facility of refrigerator while 62% urban labours do not, 05% urban labours have the facility of tape-recorder while 95% urban labours do not, 10% urban labours have the facility of computer while 90% urban labours do not, 37% urban labours have the facility of bike while 63% urban labours do not, 37% urban labours have the facility of bicycle while 63% urban labours do not, 5% urban labours have the facility of car while 95% urban labours do not.

**Table No.22****Knowledge of Government Schemes**

Sr.No.	Knowledge of Govt. Schemes	Frequency	Percentage
1	Yes	55	55
2	No	45	45
	<b>Total</b>	100	100

Source Field Work

As per the above table, it is seen that 55% urban labours well-versed with government schemes while 45% urban labours do not have any knowledge of any government scheme

**Conclusions and Recommendations**

- 61% of urban labours are from the age group of 18-25 and 38% of urban labours are from the age group of 26-50 which indicates the dominance of working youths but hardly 79% of them are not graduates and 72% of urban labours are not technically trained being ineligible for employment in various sectors. 58% of urban labours have family size of 5-8 members. India is the only country in the world which is dominated with young population but most of the youths are not well educated or technically trained. In this scenario, this population remains deprived from the benefits of globalization and liberalization. Public awareness to minimize the size of the family and proper practical training and education resulting in good placements is strongly recommended. This would also help to reduce the gap between the rich and poor.
- 69% of urban labours live in slum area. 71% of urban labours live in houses having 1-2 rooms. 68% of urban labours have the facility of public tap water, 72% of urban labours have facility of public toilet and 28% of urban labours do not have facility of electricity. 72% of urban labours have facility of Television, 74% of urban labours have facility of mobile and 38% of urban labours have the facility of refrigerator. This data reveals that the standard of living of urban labours is better than those labours who live in rural and tribal area.
- 69% of the urban labours earn between Rs.2000 to Rs.10000 and 20% of urban labours earn Rs.10000-20000 per month and 7% of urban labours earn above Rs.20000 per month. 09% of urban labours work for 10-15 hours which clearly indicates their exploitation and non implementation of labour laws. 47% of urban labours are organized and 55% of urban labours well-versed with government schemes.

Percentage of exploitation of the labours is meager but can be avoided by proper implementation of labour laws. Awareness in uniting themselves for common purpose shall help to avoid such exploitations.

## **PROFESSIONALISM IN THE FIELD OF CO-OPERATIVE MANAGEMENT**

**Prof. Kishor N.Tayde**

Asst. Professor Dept. of Commerce, L.M.M. Arts, Commerce & Ashok Science College,  
Chandur (Rly) Dist. Amravati.

**Introduction:-** Management combines ideas, processes, materials, facilities and people to effectively provide needed services to member-owners. Management is the decision making element of the co-operative. Broadly speaking, its role entails formulating and executing operating policies, providing good service, maintaining financial soundness and implementing operating efficiencies to successfully meet its objects. A successful co-operative is variable in an economic or business sense and maintains or improve its co-operative character or features. Co-operative is a voluntary association of an individual generally, the members of co-operative society belongs to weaker section of the society. Management goes to on those shoulders that are uneducated or semi-educated, or they don't have adequate knowledge of management. Due to improper management many co-operative society are not in the existence. Survival of any organisation mainly depends upon effective management technique. We are in the age of globalization where competition is very high, domestic institutions as well as Indian co-operative houses have to compete with MNCs. There successful survival is possible with the help of effective management technique. Available resources are limited such as capital and time etc .in such case, there is need to apply principles of management in the co-operatives. The application of the principles and process of management over the co-operative of the organisation implies the important of the co-operative management.

### **Objectives of the study**

4. To know the concept of Professionalism.
5. To identify the Status of a Profession to Management.
6. To check the Needs and Principles of Professional Management.

### **Research methodology**

**Research type:** - Descriptive research

**Data Collection:** - This study based on the secondary data. This information has been collected from different sources. These are as under

- ✓ **Journal, Articles, Books,**

### **Limitations:-**

4. This study based on secondary data.
5. There may be some changes.
6. This study has done in very short period of time.

**Professional Management:** Co-operative Society is formed by those people who are uneducated or semi-educated, they do have knowledge of management as well as does not have sufficient amount of managerial qualities. In this competitive world or in the age of globalisation, Co-operative Society should be excellent in management so, that societies will be able to reduce the level of wastage. Many co-operative societies have been closed down due to improper management. In the era of globalisation there is needed to apply concept of professional management for the better performance. It will increase efficiency and effectiveness and reduced level of wastage. Professionalization in management refers to systematic application of management theory. As there is growth in diversification of the co-operative business and also increases production demand. A professional management is very essential for the successful survival of the co-operative in the modern terms. According the R.C.Gupta, professionalization in management does not come automatically or just by appointing people who has

degree in professional courses such as Management, Professional in Management comes by giving authority ; Use of professionalism in decision making like before taking any decision professionals should consider the factor of changing environment, collection of information, estimates the results of decision, etc.

**The following Criteria identify the Status of a Profession to Management:**

- 1) Profession is a body of specialised knowledge.
- 2) Professional knowledge is systemised and codified from that we can learn through formal education system.
- 3) A profession emphasis on having a central body to formulate a code of behaviour for its member.
- 4) A professional calls for rendering competent and specialised services to clients.
- 5) A profession maintain the scientific attitude and commitment for discovering new ideas and upgrading. For the purpose of improving quality of service and level of efficiency provided to clients.
- 6) A profession requires members to exercise restraint and self-discipline.

Professionalism in management, a manager has to continuously strive for discovery new idea, relationship and concept and have to act in a dynamic and innovative manner to cope with the changing environment. Even so, managers are not respected as other professionals like Doctors, Advocates and Chartered Accountant.

**Needs of Professional Management:**

**1) Due to competition:**

Co-operative societies are working in the era of globalisation, there they have to compete with MNC's in such case they have to utilise available resources in proper direction and reduce the level of wastage. Due to increase in competition co-operative society need professional management system for managing its day to day business transaction. The competition has become keen due to liberalisation and globalisation. Under such circumstances professional management has become necessary.

**2) Healthy Managerial Environment:** Professionalization will distribute duties, powers and responsibilities of the executives in proper manner. It also defines the proper working policy so, it become very easy to maintain healthy managerial environment within the society.

**3) Uniformity in the work:** To maintain uniformity in the work of the society, there is a strong need to apply professional management.

**4) Optimum utilization of available resources:-** Generally, co-operative societies members belongs to poor section of the society among them most of the members are uneducated or semi – educated. They don't have a sufficient quality of management. Under such situation societies members are not in a position to take decision regarding available funds. Due to lack of skill, many a time they got failed in holding opportunities. Therefore, there is need of professional management that can be helpful to utilize the available resources.

**5) Expansion of the societies business:** -Originally, when co-operative started, they performed function in a small with the help of new technology, co-operatives are now being complex to enlarge there size of operation in a various ways. Co-operative organisation, thus need to learn the modern techniques of production and how to manage it. Thus, professional management is the key for expansion of societies business.

**6) Effective implementation of policy:-** In the era of globalisation of economic operation, many strategic areas have been developed which requires professional expertise and specialised knowledge. (Ex. Strategic planning, this is possible only if there is effective implementation of policies.)

**7) Proper division of work:-** For the successful survival of the co-operative society there is a need to distribute work according to ability, experience, education, etc. By applying concept of professional management work can be easily distribute and staff member will get that work in which they are good.

**8) Statutory control:-** Statutory control over the management can be exercised by executives through professional management.

**Principles of Professional management:** Following are the principles of professional management

**1) Uniformity in working:-** Professional management believe in uniformity working policy. They prepare same policy for every department of the society. It will reduce complexity.

**2) Principle of division:-** This mean that a work is assigned according to qualification, experience and ability etc so, work can be done with stipulated time period.

**3) Principle of relative:-** Principle of professional management are not absolute but, relative in nature, they can be applied according to the need. It is necessary to modify that principle while applying to the co-operative organisation.

**4) Principle of flexibility:-** The next principle of professional management is flexible. They are adjustable according to the changing situation. Professional managers make changes according to the problems faced by the workers.

**5) Principle of remuneration:-** Remuneration should be paid in proportion to the service render and responsibility undertaken by the manager. The entire staff of the organisation should be fairly paid with appropriate additional incentives for the additional efforts.

**6) Principle of training and development:-** Professional management try to give proper and accurate training to the workers of the management and also concentrate on personal development of individual workers for smooth functioning of management.

**Conclusion:-** Professionalization in management refers to systematic application of management theory. As there is growth in diversification of the co-operative business and also increases production demand. A professional management is very essential for the successful survival of the co-operative in the modern terms. According the R.C.Gupta, professionalization in management does not come automatically or just by appointing people who has degree in professional courses such as Management, Professional in Management comes by giving authority ; Use of professionalism in decision making like before taking any decision professionals should consider the factor of changing environment, collection of information, estimates the results of decision, etc.

## **AN ESSENCE OF SOCIALIZATION OF MANAGEMENT STYLE: RATAN TATA AND CYRUS MISTRY**

**Dr. Samrat A. Jadhav**

*Assistant Professor, Dr. C. D. Deshmukh Commerce & Sau. K. G. Tamhane Arts College, Roha-Raigad (MS)*

**Introduction:** Socialization is the process by which people acquire the dominant beliefs, values, motives, and behaviors of their culture and gradually become more similar to other members of the cultural, ethnic or religious group (Janis, Mahl, Kagan, & Hole, 1969). Socialization of management style is a wonder in business organization with last decade and half especially in India. Many oldest and big business houses in India have started the process of socialization along with professionalization. It is a well-established generalization that there is significant association between manager's management style and his or her performance. It has been specified by Roskin (1989) that the individual personality of the manager himself, the individual followers, the kind of people they are and the kind of work they do and the particular situation and circumstances on any given day or hour (Owens, 1973 cited in Roskin, 1989) are the factors on which the success of management styles relies. His view is individualistic and professional centric towards management style. Thomas (2008) compares national culture and organizational culture. According to him the national culture is shared meanings, unconditional relationship, born into it, and totally immersed whereas organizational culture is shared behaviors, conditional relationship, socialized into it and partly involved. He presented wider social approach towards management styles of managers. The corporate social responsibilities and corporate governance norms, rules and regulations have shaped up the socialization of management style in India.

**Objectives:** This study is intended to analyse the management style of Mr. Ratan Tata and Mr. Cyrus Mistry; to study the acquisitions and divestment made by Tata Group under the tenure of Mr. Ratan Tata and Mr. Cyrus Mistry and to provide suggestions to the contemporary corporate world on socialization of management style.

### **Hypothesis**

**Null Hypothesis ( $H_0$ ):** There is no significant difference between the management style of Ratan Tata and Cyrus Mistry.

**Alternative Hypothesis ( $H_a$ ):** There is a significant difference between the management style of Ratan Tata and Cyrus Mistry.

**Methodology:** This study is a case study of two business leaders and managers of Tata Empire. It is explorative in nature and primarily based on information available on official website of Tata Sons, articles in newspapers, research papers and interviews of business leaders and managers. It has used the Lion and Hyena Managers' Theory evaluating managers' quality presented by Mr. Seng Hock Tan, CEO of Aegis Group in Singapore for measuring the difference between the management style of Ratan Tata and Cyrus Mistry. At first seven characteristics of lion managers are analyzed from the point of view of both the personalities and then seven characteristics of hyena managers are analyzed for the same personalities. The null hypothesis about the difference between the management styles is statistically tested with the help of Pair t-test and P-Value.

**Result and Discussion:** Mr. Ratan Tata during his entire tenure worked together with a world class team and gained cooperation from his team members. He restructured the corporate culture of Tata Group. Mr. Ratan Tata could bring the rise by using unity of command and unity of direction. He

extended CEO's community philanthropy concept to be included in the workplace. Under his leadership, Tata group has privileged to introduce the concept of an eight-hour workday. Prior to Mr. Ratan Tata regime, there were different brands under the Tata Group of Companies and various companies under the Tata Group were competing among themselves (TELCO, TISCO, TOMCO, etc.). Then Mr. Tata decided to follow the umbrella branding strategy for all the companies and as a result, TELCO transformed in Tata Motors, TISCO transformed into Tata Steel and TOMCO transformed into Tata Oils. Mr. Tata also revamped the operations of Tata Steel and made it one of the lowest cost steel producers in the world. With a vision to give brand identity, he brought the peculiar monogram of 'T' letter. With his timely leadership styles such as transformational, transactional, Mr. Tata recognized and provided what people need and in various ways (automobile, tea, power, health, fundamental research). The visionary personality got many awards and recognition across the world. Mr. Tata integrated the group into one cohesive whole, to make it move in a common direction and in this process; he has not abandoned the traditional Tata group values of ethical business. 63% of Equity capital of Tata Sons was held by Tata Trust, which were philanthropic in nature. Mr. Tata was always interested in cars since his childhood. In 1998, Tata launched its first passenger car Tata Indica, The car went on to become the No. 1 brand in its segment within two years. Mr. Tata believes in inorganic growth and expanded the Tata's business by acquisition and divestment.

**Table 1. Tata Groups Deals under the Managerial Control of Mr. Ratan Tata (2004-2012)**

Sr. No.	Acquisition Sectors	Amt(\$ Mn)	Sr. No.	Divestment Sectors	Amt(\$ Mn)
1	Steel	12,800	1	Tele Infra. (Towers)	500
2	Automobile	2,300	2	Tele Infra. (Towers)	287
3	Chemicals	1,000	3	Refractories	131
4	Tele Infrastructure	287	4	Auto Components	52.26
5	Steel	282	5	Hardware	18
<b>Total</b>		<b>16,669</b>	<b>Total</b>		<b>988.26</b>

**Source:** [www.livemint.com/Companies/kAbZcmNBHKxBByXFhv3IRP/Cyrus-Mistry-vs-Ratan-Tata-Contrasting-styles-in-investment.html](http://www.livemint.com/Companies/kAbZcmNBHKxBByXFhv3IRP/Cyrus-Mistry-vs-Ratan-Tata-Contrasting-styles-in-investment.html)

The deals show in the Table 1 represents the leadership and management philosophy and style of Mr. Ratan Tata. He likes to create wealth and expand by acquiring others and divesting less. It also predicts his long term vision, patience and the trust on his team by giving them independence for their own decisions.

In 2012, Mr. Cyrus Mistry became chairman of the Tata Group. During his tenure, the group's debt was rising, profitability was suffering. According to the ET Bureau (Sachitanand and Layak, 2017), Mr. Cyrus Mistry was a hard decision maker. Tata Family was unhappy at Mr Mistry's policy of looking to sell off parts of the business rather than holding on to assets and extending the firm's global reach. In 2016, Mr. Cyrus was asked to step down within four years — the shortest of the Tata group on the grounds of non-performance. In the long term interest of the shareholders and Tata Group, Tata trust suggested to the board to remove Mr. Mistry and Mr. Tata became the Interim chairperson. The acquisition and divestment during the four years tenure of Mr. Cyrus Mistry was as under

**Table 2. Tata Groups Deals under the Managerial Control of Mr. Cyrus Mistry (2013-2016)**

Sr. No.	Acquisition Sectors	Amt(\$ Mn)	Sr. No.	Divestment Sectors	Amt(\$ Mn)
1	Renewable Energy	1,370	1	Telecom Services	634
2	Infra. (Road)	405	2	Telecom Services	433

3	Aviation	253	3	Chemicals	400
4	Biotech	55.7	4	Life Insurance	308
5	Steel	57	5	Hotels	125
<b>Total</b>		<b>2140.7</b>	<b>Total</b>		<b>1900</b>

**Source:** [www.livemint.com/Companies/kAbZcmNBHKxBByXFhv3IRP/Cyrus-Mistry-vs-Ratan-Tata-Contrasting-styles-in-investment.html](http://www.livemint.com/Companies/kAbZcmNBHKxBByXFhv3IRP/Cyrus-Mistry-vs-Ratan-Tata-Contrasting-styles-in-investment.html)

Table 1 and 2 shows that Mr. Cyrus Mistry have divested at an annual average rate of \$ 475 which was more than 400% as compare to Mr. Ratan Tata's annual average divestment of \$ 109.81. However, Mr. Cyrus Mistry's annual average acquisition was just 28.89% (\$535.175) of annual average acquisition of Mr. Ratan Tata. According to industry experts, the Tata group saw a string of divestments under Mistry because his focus was on return on capital. With his aggressive strategy, he disposed-off the non-profitable businesses and was keener to build new businesses--- e-commerce, defense and infrastructure -- rather than consolidating existing businesses and implementing turnaround as strategy. As per Mr. Seng Hock Tan, CEO of Aegis Group in Singapore, Lion Manager is committed to ethical and moral values; thinks long term and maintains a long-term focus; does not take shortcuts; thirsty for knowledge and learning; supports partners and alliances; treats employees as partners and admires perseverance. However, Hyena Manager has little interest in ethics and morals; thinks short term; just wants to win the game; has little interest in knowledge and learning; a survivor and an opportunist; work mostly alone; treats employees as expenses and admires tactics, resourcefulness, and guile. The case analysis of the Lion management style and Hyena management style from the point of view of Mr. Ratan Tata and from the point of view of Mr. Cyrus Mistry is indicated that Mr. Ratan Tata have satisfied all seven characteristics of Lion Management style whereas Mr. Cyrus Mistry have satisfied only two characteristics of the same. In case of the characteristics of Hyena management style Mr. Tata has achieved the score 1 and Mr. Cyrus Mistry has achieved the score 6 out of total score of 7 for seven characteristics.

**Table 3. T-Value of Mean Difference between Management Style**

Management Style	Chairman	Mean	T-Value	Df	P-Value
Lion	Mr. Tata	1.0000	3.873	6	0.008
	Mr. Mistry	0.2857			
Hyena	Mr. Tata	0.1429	3.873	6	0.008
	Mr. Mistry	0.8571			

**Source:** Compiled by Researcher

The t-value of mean difference of Lion management style and also the t-value of Hyena management style in case of Mr. Ratan Tata and Mr. Cyrus Mistry is 3.873. The P-value in both the cases is 0.008 which is below 0.05. Thus, the alternative hypothesis that there is a significant difference between the management style of Ratan Tata and Cyrus Mistry is accepted by rejecting null hypothesis.

### Major Findings, Suggestions and Conclusion

#### Findings:

- The trend in the manager's performance evaluation is changing from professional manager to professionally social manager.
- In case of family managed businesses, managers failed to incorporate the philosophy, culture, ethos and principles which make the family managed business survive, sustain and to grow are unsuccessful.

- Mr. Ratan Tata is considered as a successful business icon because he has created socialized business environment by giving required independence to the top management of Tata Group's companies. No doubt he is a professional in his area but he is more social, democratic and moderately situational.
- Mr. Ratan Tata's every act is strongly supports his social philosophy for instance holding the interest in the business instead of divesting in short term period. He was a supporter of creating and maximizing shareholders' wealth by acquisition and growth.
- Mr. Cyrus Mistry is considered as hard decision maker. He was unsuccessful as manager and leader because he used to interfere in the decision making of independent Tata Group's companies. He was professional but he was not democratic and social in his management style. During his control, he divested more instead of creation wealth he was interested in return on the capital invested.
- Mr. Cyrus Mistry has failed to create socialized business environment since he has not adopted Tata Group's philosophy, culture, ethos and principles.
- Characteristics of Lion Management Style are the significant factors in the socialization of management style. It means Mr. Ratan Tata has become an iconic successful business manager and leader because of his socialized management style. Vice versa in case of Mr. Cyrus Mistry.

#### Suggestions:

- ✚ Managers should identify the process of socialization in their business house and inculcate the values, ethics and principles of socialization of management style to become professionally social corporate managers.
- ✚ Managers' leadership should be democratic and inspirational to his colleagues, subordinates and followers. As business houses are corporate citizens of the nation, managers should be socially sensitive. This will definitely helpful for managers and business to survive, sustain and to grow.
- ✚ In big business houses like Tata Groups, the focus should be on stability, sustainability, maximization of shareholders' wealth and growth of business and not only on earning returns on capital.
- ✚ Lion management style of managers facilitates socialization of management and controlling authority. Managers should inculcate lion management style in themselves.

**Conclusion:** The implication of this paper is that the corporate leaders or executive managers who lead the business should have amalgamation between professional knowledge and skills with their ethical, social knowledge and skills. It is necessary to adopt the philosophy, vision and mission of the business house where the managers applying their head, heart and hand for decision making.

## **IMPORTANCE OF GOVERNMENT ROLE TOWARDS THE ECONOMIC DEVELOPMENT**

**Prof. S.M.Khanzode**

*Asst. Professor Dept. of Economics, L.M.M. Arts, Commerce & Ashok Science College, Chandur (Rly) Dist. Amravati.*

**Introduction:** The state has to play a vital and ever-expanding role to accelerate process of economic growth. These countries are struggling hard to get rid of poverty and to attain higher living standards. In an under-developed economy, there is a circular constellation of forces tending to act and react upon one another in such a way as to keep a poor country in a stationary state of under-development equilibrium. The vicious circle of under-developed equilibrium can be broken only by a comprehensive government planning of the process of economic development. In the initial phase, the process of development in an under-developed country is held up primarily by the lack of the basic social and economic overheads such as schools, technical colleges and research institutes, hospitals and railways, roads, ports, bridges. Provision of these overheads requires very large investments. Such investments will lead to the creation of external economies which in their turn will provide incentives for the expansion of private enterprise in the field industry as well as of agriculture. Private enterprise will not undertake investments in social overheads, because the returns from them in the form of an increase in the supply of technical skills and higher standards of education and can be realised only over a long period. Also, it will accrue to the whole society rather than to these entrepreneurs who incur the necessary large expenditure on the creation of such costly social overheads. Investments in economic overheads require huge outlays of capital which are usually beyond the capacity of private enterprise. The role of government in development is further highlighted by the fact that under-developed countries suffer from a serious deficiency of all types of resources and skills, while the need for them is so great. In these circumstances, what is needed is a wise and efficient allocation of limited resources. This only the State is best fitted to do through central planning, according to a scheme of priorities well suited to the country's conditions and needs. Until the country has attained the stage of self-sustained growth, the Government must make determined and conscious efforts to push the economy through the take-off period of development.

### **Objectives of the study**

7. To identify role of Govt. in the development process of Indian Economy.
8. To identify role of small scale and cottage industries.
9. To identify Govt. measures in promoting economic development

### **Research methodology**

**Research type:** - Descriptive research

**Data Collection:** - This study based on the secondary data. This information has been collected from different sources. These are as under

- ✓ **Journal, Articles, Books,**

### **Limitations:-**

7. This study based on secondary data.
8. There may be some changes.
9. This study has done in very short period of time.

**Government measures to promote economic development:** In view of the peculiar circumstances in which politically, socially and economically the under-developed countries are placed, there is not only a great urgency about economic development but also an infinitely much greater effort is required to generate the forces of economic growth. This effort is obviously beyond private enterprise in such countries. Owing to adverse political, economic and social factors, these countries have been for long in a state of economic stagnation. They are now becoming painfully aware of the widening disparity between their economic condition and that of the advanced countries, which are getting richer everyday whereas they are caught up in the vicious circle poverty. This necessitates a comprehensive set of measures to be adopted by the government not only to rouse them up from the state of economic slumber but to see them march quickly on the road of development. The following are the principal measures, which are necessary for the government of an under- developed country to take in order to accelerate the process of economic growth.

**Provision of Economic and Social overheads:** If economic growth is to be accelerated, it is necessary for the government to provide an adequate measure economic and social overhead facilities also called the overhead capital and services or infrastructure. Economic infrastructure includes transport facilities, e.g., railways, roads, harbours, air fields, etc. Means of communications, e.g. postal telegraph and telephone facilities, electric and even atomic energy, irrigation facilities, etc. The social overheads or infrastructure consists of educational institutions (schools, colleges and universities) both for general education and technical training, public health, and medical facilities, housing, water supply and other welfare schemes. "The availability of adequate overhead facilities brings about external economies to other industries, lowers their capital coefficient and by thus improving the efficiency of general investment, makes possible a more rapid rate of economic growth."

**Provision of Financial Facilities:** Finance is the crux of the problem of development. We know that the under-developed countries suffer from scarcity of capital which is the greatest handicap in their economic growth. No doubt that their savings are meagre but even the meagre savings are not available for economic development To mobilise these savings, a sound banking system essential and other financial institutions are required to canalise these savings into investments and supply the credit needs of trade and industry The government is to see that appropriate financial institutions are set up to meet the requirements of the entrepreneurs. In India, for instance, the government took steps to reform the banking system and put it on a sound footing. Fourteen major commercial banks were nationalised in 1969. In the agricultural sector to meet the short-term credit needs of the farmers, co-operative societies were set up and, for long term credit, land mortgage banks or land development banks have been organised. Two funds were set up National Agricultural Credit (Long-term) Operations Fund and National Agricultural Credit (Stabilisation) Fund. The farmer is meant to give long-term loans to State Government to enable them to buy shares of co-operatives and to grant medium term loans to co-operatives and long-term loans to land development banks and the latter fund to give medium-term loans to State Co-operative Banks to enable them to convert short-term loans into medium term loans. Agricultural Refinance Corporation was set up to serve as refinancing agency for agricultural credit and to give assistance for reclamation of land, development of assistance for reclamation of land, development of special crops, mechanical farming and development of animal husbandry dairy farming, poultry etc. Small Farmers Developments Agencies (S F.D.A.'s) were established and Marginal Farmers and Agricultural labour (M.F.AL) schemes were taken up Agro Industries Corporations have also been set up to give loans for the purchase of tractors and agricultural machinery. In the industrial sector too, financial and other institutions were established to promote industrial development. To assist the small scale and cottage industries several boards were set up such as the Cottage Industries Board. All India Handicrafts Board, Central Marketing Organisation, Inventions Promotion Board, State Financial Corporations, National Small Industries Corporation, etc. For the large scale industries were set up the Industrial Finance Corporation of India and the Industrial Development Bank of India. Unit Trust of

India was created to promote investment. National Industrial Development Corporation was established to grant special loans for the rehabilitation and modernisation of cotton textile mills and jute mills. Industrial Credit and Investment Corporation was set up to assist the creation, expansion and modernisation of industrial enterprises in the private sector. For relending facilities Refinance Corporation for industry was set up. Export Credit and Guarantee Corporation was created to insure against export risks, financial and political and to furnish guarantees to banks to assist exporters to secure liberal credit facilities. This gives some idea as to what a Government in an under-developed country can do in the matter of provision of financial facilities.

**Institutional Changes:** Out-mode institutions and legal and social structure too stand in the way of economic development of the underdeveloped countries. Lot of reform and reorganisation is essential to initiate and accelerate the process of growth. In the sphere of trade and industry, government encourages small industries and regulates and controls the big corporation to prevent the creation of monopolies. To improve labour efficiency, technical institutions are set up. The state also regulates relations between lab and capital to maintain industrial peace by means labour legislation to increase output and minimise losses. The government also promotes marketing to enable the producers to get a fair price for the products. These measures accelerate economic growth by improving the organisation of production and building up non-material or intangible capital which assist productive effort as much as material capital.

**Direct Participation:** In addition to the measures mentioned above, the Governments in underdeveloped countries directly participate in economic enterprises to assist private enterprise or to set for them a model to follow. In pursuance of the Industrial Policy Resolutions of 1948 and 1956, the Government of India has setup huge public undertakings in diverse fields like the steel plants, heavy electricals, heavy engineering machine tools, fertilizers, oil refineries, antibiotics, etc. The profits of these undertakings are available for use in economic development plans. The Government mainly confines itself to basic, heavy and key industries which help other industries, whereas the private sector operates in manufacturing and consumption goods industries.

**Indirect Measures:** Besides promoting economic development directly as explained above, the Governments of under developed countries promote economic growth of their countries indirectly too. The indirect measure relate to the adoption of economic policies which may be conducive to economic growth. These policies mainly are monetary policy, fiscal policy and commercial policy. The objective of monetary policy is control and regulate credit to ensure growth with stability. Credit is liberalised to help industrial and business enterprise, but when it is felt that too easy monetary conditions are hampering growth, credit curbs are applied to check speculation and inflation. As for fiscal policy, taxation is used as an instrument for checking consumption increasing savings and preventing investment in undesirable channels and canalising them into desired directions so that economic growth is accelerated and not slowed down. Commercial policy is so designed as to check undesirable imports and promote exports. Foreign exchange dealings are regulated and exchange control instituted to prevent balance of payments position getting out of hand.

**Rationale of Public Sector in Economic Development:** We have referred above to the direct participation of the government in industrial enterprises with a view to promoting economic growth in the country. This means the launching of public sector enterprises. The rationale of the public sector lies in a large number of imperatives of development which may now be dealt with at some length. The raison deters or a rationale for the public sector undertakings is to be found in the inadequacies or weaknesses of the price system. The price system, as it actually functions, is far from being an ideal mechanism for the efficient running of an economy especially, in terms of the three vital considerations of resource allocation, income distribution and employment.

#### 1. The Compensatory Role:

The participation of the public sector undertakings in the economic activities is called for when it has a compensatory role to perform. The compensatory role, in turn would be necessitated when there is a need to compensate for the deficiencies or shortfalls of the price system.

When the public sector assumes a compensatory role it serves to provide a substitute for the private sector of the economy. In fact, the public sector enterprises then perform the functions of a corrective activity or device. This in itself provides rationale for the participation of public enterprises in economic activity.

In the same way, where the price mechanism hinders the full utilisation of resources due to the existence of monopolistic tendencies or externalities, the public sector has to step in to remedy the situation. The public sector, in such cases, makes up for the deficiency by its direct participation in the productive and distributive activities of the economy.

## 2. The Adjunctive Role:

The price system may not only fail to function satisfactorily, but also in a number of situations it may fail all together. And when the market mechanism fails to operate, certain goods and services would not be produced in the economy. Under such a situation, it is necessary for the public sector to undertake or to produce these goods and services. These public activities would in effect, be an addition to the overall level of economic activity of the economy. That is how an adjunctive role is assumed by the Public sector undertakings.

In general, the public sector performs its adjunctive role when it aims at producing public goods or what is the same thing satisfying public (or social) wants. The market mechanism fails to register the true preferences of individuals for public goods (e.g., roads, bridges, courts, police, etc.) Since no private enterprise can afford to undertake activities aimed at satisfying public (or social) wants, the public sector has necessarily to step-in in this direction.

### **Role of Public Enterprises in Economic Development.**

It is now recognised that in the underdeveloped countries, the vicious circle of underdevelopment can be broken only by a bold intervention by the government in the form of public sector enterprises.

The role of public enterprises both in accelerating development and realising the avowed social objectives of underdeveloped countries can be brought as under:

(a) Achieving Socialistic Pattern, (b) Building Industrial Base, (c) Capital Formation, (d) Optimum allocation of resources strategies, (e) Balanced and unbalanced Growth, (f) Balanced Regional Development, (g) Achieving Social Objectives.

Some other ways in which public sector can promote economic development are as under:

- ✓ Diversification of economic structure.
- ✓ Enlargement of employment.
- ✓ Bridging the entrepreneurial gap.
- ✓ Generating foreign exchange earnings.
- ✓ Supporting private enterprise.
- ✓ Bulwark against maleficent tendencies.

**Conclusion:** Thus the government in an under developed country has a vital role to play in stepping up its rate of growth directly by participation in economic activity, by providing economic and social overhead capital or building the necessary infrastructure, by creating financial institutions and by moulding the social structure and adapting the legal framework to the tasks of development and indirectly by pursuing suitable monetary, fiscal and trade policies.

## **STRUCTURAL CHANGE AND ECONOMIC GROWTH OF ECONOMY IN STATE OF MAHARASHTRA**

**Dr. Vaidya Sanjay G.**

*Associate Professor of Economics, Post Graduate Teaching & Research Centre, R. B. Narayanrao Borawake College, Shrirampur, Dist. Ahmednagar, Pin-413709, (M.S.)*

**Introduction:** Structural Changes refers to the transformation in which economies undergo shifts in their economic structure from a heavy dependence on agriculture to more modern, more urbanized and more industrially diverse manufacturing and services economy. It is also characterized with transformation in sectoral employment, wherein employment rises rapidly in non-farm sector and labour is pulled out of agriculture at a speed that depends on labour intensity of industry and services. Rapid agricultural productivity growth allows for a reduction of labour input per unit of output. There comes a point which is significantly marked with share of labour declining faster than the output in agriculture sector. The speed with which a country or state is able to execute this transformation play a key role differentiating economies from being developed, underdeveloped or developing. The Structure changes in the economies can be studied in respect of different outcomes like output, employment, capital investment, capital accumulation and consumption. The various dimensions in which they could be analyzed include sectors, rural-urban group, production units, consumption and income group, technological and productivity variations along location, skills, gender and social group. An analysis of structural changes accompanying economic growth brings out exhibitions of the structure and distribution growth.

**Review of Literature:** The pioneering work of Fisher (1935), Clark (1940), Chenery (1960), and Kuznets (1917) postulates a set of stylized facts from empirical evidences relating to the industrially developed economies. The literature highlights the gradual pattern of structure change of developed economies from agriculture to industries and from industries to services with higher income elasticity of demand for industrial goods and even higher for services than industrial goods. With rising levels of incomes, the demand for agricultural goods proportionately grow at a lower rate than the income, due to low income elasticity of demand for agriculture goods is less than one which means they are necessities, on the other hand, the demand for the income elasticity of demand for industrial goods is greater than one which leads to growth of industrial sector. At a certain point where the economy reaches a sufficiently high level of income, the rate of increase in demand for services increases sharply due to even Fisher refers to this transformation in patterns of the service sector is defined by the saturation of demand for manufactured goods. The structural change is defined as a process of combining economic growth with changing share of different sectors in gross domestic Product (GDP) and labour force. The timing of different phases of structural changes and the speed of such change have of course been different among different countries or state. In spite of differences in timing of entry into the era of modern economic development and its speed of transformation the share of primary sector had declined to less than 15 percent in most of developed countries (Such as UK, France, Italy, USA & Japan etc.) by the middle of the twentieth century. Further, it reduced to less than 5 percent in all these countries by the end of the twentieth century. It is interesting to note that by the beginning of twenty first century, in most of these countries, the secondary sector has the same share in their output as it was during the beginning of their journey to modern economic development. Thus in the years 2015 the share of secondary sector in national output of United Kingdom was 20.5 percent as compared to 23 percent in

1801, in France 18.7 percent compared to 25 percent in 1841, in Germany 30.1 percent as compared to 24 percent in 1841, in United States of America 19.5 percent as compared to 20 percent in 1841 and Italy 24.4 percent as compared to 22 percent in 1901. The tertiary sector has experienced a secular rise in its share right through the period of modern economic development growth in all of these developed countries. The share of tertiary sector in national output of these countries was above 65 percent as compared to 40 to 50 percent. We are observed that the end of the twentieth century most of the developed countries showed a remarkably similar production structure of their economies. Thus, primary sector contributed less than 5 percent in GDP, Secondary sector 20 percent to 30 percent and services around 70 percent in all of them. The percentage sectoral shares in employment of these selected developed countries the fact that by the end of 20<sup>th</sup> century, wherein primary sector contributed less than 5%, secondary sector 20% to 30% and services around 70% in all of them. Thus, the share of each sector in employment is moving in line with the GDP share of that sector. However, none of the above mentioned papers discussed about structural change or directly examine its empirical link to India's economic growth. Cortuk and Singh (2011), using standard definitions of structural change indices, examine the connection between measures of structural change and growth in India, for the period 1951-2007. They find that there is a structural break in the two time series, and this break occurs in 1988. Furthermore, there is a one-way causal relationship between structural change and growth, but only for the 1988-2007 periods. Hence, this analysis provides more objective empirical support for previous informal assertions in the literature.

**Growth rate of GDP and sector wise contribution and per capita income (at constant price) in Indian economy:** Indian economy is classified in three sectors such as Agriculture and allied, Industry and Services. Agriculture sector includes Agriculture (Agriculture proper & Livestock), Forestry & Logging, Fishing and related activities. Industry includes 'Mining & quarrying', Manufacturing (Registered & Unregistered), Electricity, Gas, Water supply and Construction. Services sector includes trade, hotels, transport, communication and services related to broadcasting, Financial, real estate & Public Administration, defence and other services. Services sector is the largest sector of India.

- According to table (1), show that increasing trend in India's Gross Domestic product at constant price 2004-05, during period 1960-61 to 2015-16. India's GDP is Rs. 11350962 crores in 2015-16 as compared to Rs. 434497 crores in 1960-61. During this period India's GDP growth rate as follow: 5.5 percent in 1960-61, 6.8 percent in 1980-81, 5.3 percent in 1990-91, 3.6 percent in 2000-01, 9.8 percent in 2010-11, 6.6 percent in 2013-14, 7.5 percent in 2015-16 and 6.3 percent in 2016-17. In this period average annual growth rate of India's GDP is 6.46 percent. On the other hand 6<sup>th</sup> five years plan (1980-81 to 1984-85) annual growth rate is 5.4 percent, in 7<sup>th</sup> five years plan (1985-86 to 1989-90) annual growth rate is 5.8 percent, annual growth rate is 6.5 percent in 8<sup>th</sup> five year plan (1997-98 to 2001-02), annual growth rate is 5.6 percent in 9<sup>th</sup> five year plan (1997-98 to 2001-02), annual growth rate is 7.6 percent in 10<sup>th</sup> five year plan (2002-03 to 2006-07), 11<sup>th</sup> five years plan (2007-08 to 2011-12) annual growth rate of GDP is 7.8 percent and 12<sup>th</sup> five years plan (2013-14 to 2017-18) annual growth rate of GDP is approximately 7.8 percent.
- Change in composition of GDP for major sectors of the economy such as Agriculture & Allied Services, Industry, and Services during the period 1960-61 to 2016-17 is presented in the table (1). According to sector wise Indian GDP composition in 2014 are as follows: Agriculture (17.9%), Industry (24.2%) and Services (57.9%). Total production of agriculture sector is \$366.92 billion. India is 2nd larger producer of agriculture product. India accounts for 7.68 percent of total global

agricultural output. GDP of Industry sector is \$495.62 billion and world rank is 12. In Services sector, India world rank is 11 and GDP is \$1185.79 billion. Contribution of Agriculture sector in Indian economy is much higher than world's average (6.1%). Contribution of Industry and Services sector is lower than world's average 30.5% for Industry sector and 63.5% for Services sector.

- At previous methodology, composition of Agriculture & allied, Industry, and Services sector was 51.81%, 14.16%, and 33.25%, respectively at current prices in 1950-51. Share of Agriculture & allied sector has declined at 18.20% in 2013-14. Share of Services sector has improved to 57.03%. Share of Industry sector has also increased to 24.77
- At 2011-12 prices, composition of Agriculture & allied, Industry, and Services sector are 15.11%, 31.12%, and 53.77%, respectively.
- In 2011-12, Contribution to GDP of Agriculture sector was 14%, Mining & Quarrying was 2.06%, and Industry was 27.5% while that of Services sector was 58%.
- After 1950-51, for more than a decade, share of services in GDP was around 30 per cent, overtime the share of services sector in GDP has increased while that of agriculture has declined. In the last decade, the share of services has surpassed the combined share of agriculture and industry, making it the most important contributor to the country's output.
- Gross Value Added (GVA) at current prices for Services sector is estimated at 73.79 lakh crore INR in 2016-17. Services sector accounts for 53.66% of total India's GVA of 137.51 lakh crore Indian rupees. With GVA of Rs. 39.90 lakh crore, Industry sector contributes 29.02%. While, Agriculture and allied sector shares 17.32% and GVA is around of 23.82 lakh crore INR.
- Shows that the per capita income has an upward trend when compared with last year due to changing sector composition in economy. During this period India's growth rate of per capita income as follow: increased per capita income Rs.72431 and their AGR 6.2 percent as compared to Rs.9482 and their AGR 3.8 percent in 1960-61.
- Above analysis show that significant controversy about sectoral labours force distribution, India's agricultural sector contribution in GDP 10 to 15 percent and above 60 percent labour force engaged in these sector and other hands 60 to 75 percent contributed services sector in GDP but hardly 12 to 16 percent labour force worked in services sector and 20 to 25 percent labour force work in industrial sector respectively in Indian economy.

**Table No. (1): Growth rate of GDP and sector wise contribution and per capita income (at constant price2004-05) in Indian economy**

Years	GDP at Constant Price (In crores Rupees) And Annual Growth Rate (In %)	Sector wise shares in GDP (in Percentage)			Per capita income (In Rupees) and Annual Growth rate (In %)
		Agriculture	Industrial	Services	
1960-61	434497 (5.5)	39.09	17.76	43.15	9482 (3.8)
1970-71	640275 (5.2)	36.88	20.48	42.64	11025 (2.4)
1980-81	866338 (6.8)	30.20	24.29	45.51	11711 (4.5)
1990-91	1470766 (5.3)	32.2	27.2	40.6	15996 (3.1)

2000-01	2535911 (3.6)	24.0	26.7	49.3	22491 (1.4)
2004-05	3219835 (7.9)	22.5	26.4	51.1	26629 (6.0)
2010-11	5227739 (9.8)	16.7	26.0	57.3	39270 (8.3)
2011-12	8659215 (6.9)	16.2	25.4	58.4	63460 (5.1)
2012-13	9118709 (5.3)	15.6	24.8	59.6	65664 (3.5)
2013-14	9717062 (6.6)	14.94	24.77	60.77	68867 (4.9)
2014-15	10427701 (7.3)	14.50	24.4	61.1	72889 (5.8)
2015-16	112114077 (7.5)	13.94	24.2	61.86	72431 (6.2)
2016-17	11350962 (6.3)	13.94	24.2	61.86	---

### **Structural Change and Economic development in State of Maharashtra**

1. **Structure of population in Maharashtra:** Generally Structural change of population and economics are interrelated process. Maharashtra state is one of industrialized and developed state in India. Maharashtra, located in Western India, covers an area of 3.08 lakh square km and has the second most population state next to Uttar Pradesh and followed by Bihar. Its population contribution can be seen in the range of 8% to 9.50% from 1960's to 2013. Its increasing population which was 11.24 crores in 2011 was 9.28 percent to India's population as compared to 3.96 crores (9.01 percent in 1961). The 35 districts are divided into 109 sub-divisions and 357 taluks. Urbanization is an integral part of economic development as the economy develops, there is an increase in the per capita income and also in the demand for non farm goods in the economy. The level of urbanization is regarded as an index of economic development. The State of Maharashtra assumes special significance as it is most urbanized states in India with 45% of population living in urban areas compared to 31 % at the all India level. However, the urban population showed a rising trend, it was 28.75 percent of total population in 1951 to 42.41 percent in 2001 and 45.28 percent in 2011. Considering the population of male & female in the state the percentage haven't changed much over 7 decades, male population is averaged around 51.73% and female it stands around 48.27 % of the total population. The sex ratio in the state has shown continually declining which is 941 in 1950, 922 in 2001 and 925 in 2011. Literacy is one of the important indicators that reflect socio-economic condition of the population which given information on human resource development. State of Maharashtra has shown continually rising trends of literacy rate which is total literacy rate 82.91%, and male 89.82 % and 75.48 % for female as per census 2011.

The changing structure of employment in state is regarded as an index of economic development although the processes of economic growth and structure change are intimately connected, agriculture (Mean primary) sector is largest employer of work force in state of Maharashtra providing livelihood to 49.3 % of working population in the year 2015 and same year to secondary sector providing to 21% and tertiary sector 33% of working population.

2. **Growth rate of NSDP and sector wise contribution and per capita income (at constant price) in Maharashtra:** Economic structure is defined as the composition of various components of the

macro aggregates relative change in their size over time and its relationship with the circular flow of income (Jackson 1990). The state economies develop from an agricultural to industrialized and service sector (quaternary and quinary sectors) based economies there is an explicit transformation among the inter sectoral relationships among industries. The initial concentration of economic interaction is among primary sector activities, and matures to secondary and tertiary sector interaction at later stages of development.

- The Net State Domestic Product for the state of Maharashtra at constant prices in 1960-61 stood at Rs. 1597.40 crores, which improved by an impressive growth of more than doubling the figures in 1970 -71 to Rs. 3877.6 crores, the next decade showed improvement by almost five time than previous decade figures wherein the NSDP stood at Rs. 15163 crores in 1980-81, the growth of NSDP at constant prices for the next decade improved by almost 1.8 time at Rs. 27224 crores in 1990-91, the reforms process initiated during the start of 90's speeded up the growth of NSDP wherein the NSDP stood at Rs. 210526 crores in 2000-01, this growth sustained with the NSDP at Rs. 667626 crores in 2010-11, at Rs. 1267144 crores in 2013-14, the figures of NSDP for 2015-16 stood at Rs. 1441675 crores.
- The growth performance of NSDP at constant prices from 1961 to 1971 stood at an average of 14.27 per annum which improved to 29.10 percent for 1971- to 1981, 7.95 percent in 1981- to 1991, 32.85 percent during 1991-2001, 12.91 percent during 2001- 20011, 5.87 percent in 2012-13 and 5.44 percent during 2013-2017. During this period State of Maharashtra's NSDP compound annual growth rate (CAGR) stood at 15.41 percent.
- The growth pattern of different sectors of the economy shows an emergence of the service sector as the major contributor, decline in the share of agriculture sector and industry sector has seen a steep decline during this period.
- As per table (2), clearly shows that the contribution of Agriculture, Industrial and Services sector in NSDP was 9.56%, 22.67%, and 68.09% respectively in 2015-16, as compared to 41.84%, 26.42% and 31.74% respectively in 1960-61, at current prices. Share of Agriculture sector has declined at 9.56% in 2015-16. Share of Services sector has improved to 68.09 %. Share of Industry sector has also declined at 22.35%. The average rate of contribution of agriculture sector 17.47 percent, industrial sector 27.25 percent and services sector 55.02 percent in during the study periods.
- Per capita income is important barometer used in policy decision making for development strategies though the income reflected through per capita income is not evenly distributed. Table (2), highlight the per capita income for the state of Maharashtra at constant prices. It can observe that increasing trends in per capita income, which is Rs. 121515 in 2015-16 as compared Rs. 409 in 1960-61. Compound annual growth rate (CAGR) of per capita income stood at 4.40 percent during the period.

**Table No. (2): Growth rate of NSDP and sector wise contribution and per capita income (at constant price 2004-05) in Maharashtra**

Years	NSDP at constant prices (in crores Rupees)	Sectoral Contribution in NSDP			Per capita income (In Rupees) and Annual Growth rate (In %)

Source: Calculated, Economic survey of Maharashtra,

### Conclusions

- The growth pattern of different sectors of the economy shows an emergence of the service sector as the major contributor, decline in the share of agriculture sector and industry sector has seen a steep decline during this period. It indicates that state of Maharashtra were able to shift their labour force from low – productivity agriculture to higher productivity industry and service sectors, and to increase productivity within those sectors.
- As far as the high income states of Maharashtra is concerned its coefficient is positive while the coefficient of the log of per capita NSDP is negative and statistical significant at the 5% level. It suggests that high income states have positive associations with industrial & services sector, yet it has influenced negatively to the economic growth in India during the study period.
- The findings also show that the service sector has a highest positive influence on per capita income. Thus the impact of structural change is not automatic and homogenous throughout the Indian States during the study period. Whether India will be able to capitalize on its favorable growth depends on how well the EAG states are able to reform their economies.

## THE CHANGING CONTOURS OF INDIA'S RURAL ECONOMY

**Introduction:** At the beginning of the 1950s, India was mainly rural and a low-income economy with agriculture as the predominant sector for income and employment. India defines rural areas as all localities with population below 5,000, population density below 400 persons per square kilometer with atleast 75% of the male working population engaged in agriculture. Over last decades the Indian rural economy has made dramatic improvements in terms of its structural transformation, in standard of living of its inhabitants, and in the development of the secondary and tertiary sectors. Over this period, the agricultural growth in particular has made the economy self sufficient in food, providing a residual surplus for export and capital for other sectors. The rural sector as a result of rapid industrialization and urbanization has undergone substantial changes in composition and the industries and services now form an integral part of the output and employment of it. In the latest years, the share of agriculture in total Indian gross domestic product (GDP) has declined to its all time lowest and this transition is remarkable considering the initial situation in the country half a century ago. Although the concentration of workforce in agriculture and its associated activities are decreasing consistently over the years, the agriculture sector is still a dominant source of employment in rural areas, Vyas and Mathai (1978), Eapen (1994). The less rapid growth in "rural" non-farm employment in India may thus stem, in part, from the automatic reclassification of rural areas as "urban" as the non-farm economy goes. The Indian natural endowment in favour agriculture and sustained efforts on the part of the government has helped the Indian economy to have leading indicators compared to other economies of the world (*See Table 1*). The easy availability of agricultural labour, higher percentage of agricultural lands the proportion of irrigated land to total agricultural land speak by itself about the untapped growth opportunities available in this sector. For rural enterprises in India, the Annual Survey of Industries (ASI) provides data for manufacturing units only, but National Sample Survey (NSS) on employment and National Accounts Statistics (NAS) include all types of rural establishments, both in industry as well as in commerce and services. The Reserve Bank of India (RBI) maintains an updated record on the sectoral direct and indirect credit directed towards agriculture as well as the composition of the national GDP.

**Table 1 Select Agricultural Indicator of the Global Cross-Sectional Economies, Year ending 2003**

Indicators	India	Asia Pacific Developing	Asia Pacific Developed	Asia Pacific Total	World
Agricultural Land to Total Land	57.1	20.3	7.1	16.7	11.7
Agricultural Population to Total Population	53.2	55.9	3.9	55.9	42
Agriculture Land to Agricultural Population	0.31	0.27	10.05	0.3	0.59
Irrigated Land to Agricultural Land	32.3	33.2	9	30.7	17.8

**Objectives & Organization:** In the light of the above issues, we attempt to discuss the transformation in Indian rural economy by organizing this study in 5 sections. We mirror the changing profile of our rural economy by offering some quantitative evidence that the availability of funds matters to the growth of rural income in India. This paper examines how the development of the rural sector has followed different paths in India over the past five decades and queries whether this can help us better explain differences in the evolution of directed policy initiatives over such a longer period. The various policies and associated institutional arrangements that have been implemented in recent decades are quantified in terms of Rural-Urban Income, Rural-Urban Employment and Rural Finance in Section 2, 3 & 4 respectively. Finally the paper attempts to analyze the dynamics of the rural income primarily caused by the availability of funds, while Section 5 concludes and indicates the areas for further policy formulations.

**Data & Methods:** The secondary data for the analysis is drawn from host of sources like the ASI, NAS, NSS rounds and publications of RBI and the Dept. of Agriculture & Cooperation, Government of India (GoI). We compute simple averages, percentages and test for equality of means using two related sample  $t$  test assuming equal and unequal variances and  $F$  test for two unrelated samples. The significance levels are fixed at 0.05 percentages. The change in economic policy and its impact on the rural economy as such is accounted by providing for simplest form of dummies to distinguish the pre and post liberalisation periods. Descriptive statistics and Pearson's correlation describe the data, while the multiple regressions using Ordinary Least Squares (OLS) method is used to quantify the economic and statistical relation between the given dependent and independent variables.

**2. Rural-Urban Income :** Sectoral demand matrices substantiate the importance of rural demand to boost other activities. The variation in rural income causes variations in the demand for products of industrial as well as the services sector. It would be useful thus, to indicate the dynamics of the GDP contributed by the agriculture and allied activities to the economy over a long period. Table 2 reveals the cyclical nature of rural income in nominal terms measured by growth rate in agricultural GDP for latest five decades, though no attempt is made herein to measure the impact of such behaviour on rural incomes and consumption patterns. Agriculture, considered individually registers a growth to the tune of 10.5% in the post reform periods compared to approx. 9% and is neither statistically nor economically significant in the post reform periods compared to the former. The growth in the Forestry and Fishing sub-sector however is negligible and apathetic.

**Table 2 Annual Averages of Sub-period Growth Rates of GDP in Agriculture at Factor Cost, 1951 through 2005 (Current Prices)**

Sub-periods	Agriculture and Allied Activities	Of which	
		Agriculture	Forestry & Fishing

Indian economy today is not necessarily agricultural for the contours of rural India have been changing continuously, and at a much faster rate (*See Figure 1*). The contribution of agriculture in the country's total GDP has fallen drastically by half till the latest quinquennium 2001-2005 compared to the first, 1971-75. The latest NSS round suggests the main source of livelihood of over 33% of the rural households is not from agriculture. Also, the share of expenditure on food items is decreasing overtime while that on non-food is rising. In 1993-94 food accounts for 65% of average rural per capita annual expenditure. By 1999-2000, it has reduced to 62%. However in the same periods, the expenditure on non-food items increased by whopping 17%

**Figure 1 Composition of Indian GDP at Current Prices 1971 through 2005**

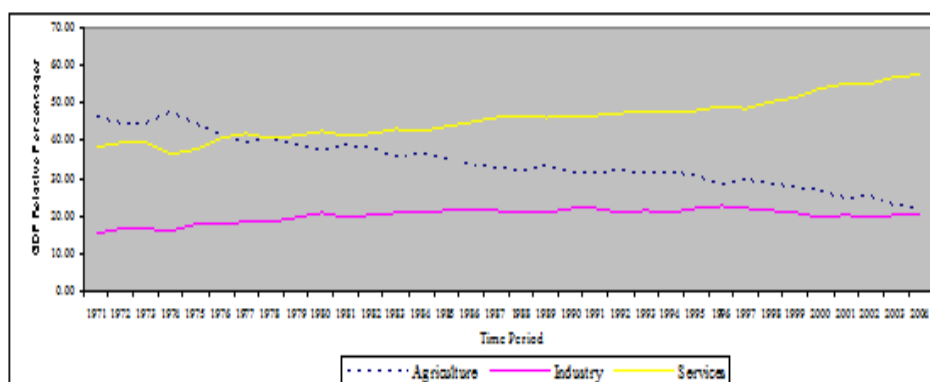

Table 3 reports that in the post-reform period the Services sector constitute to the extent of 51% of India's GDP, overtaking agriculture from the year 1981 onwards. The drop in the contribution of agriculture is to the extent of 13% in the post-reform periods compared to the pre-reform years and is both, statistically and economically significant.

**Table 3 Annual Sub-period Composition of Indian Gross Domestic Product at Current Prices 1971 through 2005 (% terms)**

Sub-periods	Agriculture & Allied Activities	Industry	Services
1971-75	44.22	16.36	39.42
1976-80	41.38	17.45	41.17
1981-85	38.70	18.60	42.70

Notes & Source: Same as in Table 2

Table 4 present interesting facts on the comparative composition of rural and urban NDP. In the year 2000, compared to a decade ago Indian rural economy lost out to the urban economy in the contribution to National NDP. In the composition of rural NDP too there has been a considerable change. Agriculture and allied activities in the latest year 2000 contribute around 10% less than what it used to in 1980's; whereas commerce and services have flourished, proving the most buoyant segments of the rural non-farm economy over the last decade. During this periods, less efficient small industries that are unable to compete on economic terms, after liberalisation may have closed down, Chadha (1993, 1996) leading to the reduction of the rural income share earned in manufacturing establishments. The rural economy thus appears to be undergoing a process of re-adjustment wherein the unviable units are being weeded out while the rural services and commerce (*viz.* Transport Community, Social & Services., Transport & Communications, Utilities & Construction) continue to grow rapidly.

**Table 4 Share of Rural & Urban, Industry wise Net Domestic Product (In %)**

Industry Division	Share in Rural NDP		Industry wise Share in Total NDP			
	1980-81	1999-00	<i>Rural</i>	<i>Urban</i>	<i>Rural</i>	<i>Urban</i>

**3. Rural-Urban Employment:** It is a universally accepted fact that the agricultural sector is, by itself, incapable of creating additional opportunities of gainful employment in the wake of increasing population. As a result, the impetus for achieving sustained development in rural areas has to pivot around expanding the base of non-farm activities, Mehta (1992). The activities related animal husbandry, fishing and hunting, forestry and logging form the part of agriculture sector are commonly included in non-farm sector, Chadha (1993). Other rural non-farm economic activities consist of wide ranging various traditional and modern manufacturing activities, mining and quarrying, construction, trading, transport, storage and communication, hoteling and those are rendering community and personal services. A number of studies like that of Bhattacharya (1986), Kabra (1992), Pathak (1982), Mathur (1993) *etc.*, look into the contribution of rural industrial component, a most important segment of rural non-farm sector, in the creation of employment and income opportunities for rural population and alike. Consistent with some of the above studies we find that due to the skewed land and human capital distribution, the less educated rural workforce seem to have lost out to the urban-based service industry that has benefited most from India's gradual liberalization from the early 1990s. Table 5 explains that the percentage decrease in the rural population is far higher than the annual exponential rise in the total population of India during the 1951-2001 periods. The percentage of rural population in

the total population falls by 13% whereas the number of cultivators measured as a percent of rural population fall drastically at the rate of 27% till the end of the year 2001, compared to 1951.

**Table 5 Decadal Trends in Population and Agriculture Workers**

Year Ending	Annual Exponential Growth in Total Population (Average)	Rural Population (% of Total Population)	Cultivators (% of Rural Population)
1951	1.25	82.7	23.41
1961	1.96	82	27.64
1971	2.22	80.1	17.81
1981	2.20	76.7	17.66
1991	2.14	74.3	17.60
2001	1.95	72.2	17.14

Source: Compiled from National Sample Survey, Various Rounds

The recent trends in rural unemployment however raise challenges ahead. The latest available figures show a sharp increase in rural unemployment, both for males and females in agricultural & allied activities, between the 1994 and 2000 period (Table 6). This is in contrast to the previous trend of decline in the rates of unemployment both in the rural and the urban sector between the late 1970s and the early 1990s. Given the context of extensive rural underemployment especially in agriculture, there is a danger that this open unemployment might lead to social tensions in the near future. To mitigate the crisis, successive governments have resorted to generation of wage employment through rural public works projects. Although they were supposed to be temporary, political considerations have prevented them from being discontinued.

**Table 6 Rural & Urban Unemployment Rate in India on Current Daily Status Basis**

Sub-periods	Rural			Urban		
	Male	Female	Total	Male	Female	Total
1978	7.1	9.2	7.7	9.2	14.5	10.3
1983	7.5	9	7.9	9.4	11	9.5
1988	4.6	6.7	5.3	8.8	12	9.4
1994	5.6	5.6	5.6	6.7	10.5	7.4
2000	7.2	7.3	7.2	7.2	9.8	7.7

Source: Compiled from the Data on National Accounts Statistics & National Sample Survey, Various Rounds

In general, India's growth story in the decade of the 1990's has been one of rapid expansion of the service sector, which now has the largest share in GDP and also an increasing share in employment both in rural as well as urban areas (*See Table 7*). In some ways, India has bypassed the traditional progression from being an agricultural economy to an industrial one, Roach (2004). With nearly 60% of the population still engaged in agriculture, there is an opportunity to redeploy labor to the rural service and commercial sector. One of the major strength of the Indian rural sector is in the potential for further structural transformation of the rural economy in the coming years.

**Table 7 Area & Sector-wise Distribution of Total Employment in India**

Year	Area	Agriculture & Allied	Mining & Quarrying	Manufacturing	Services	Employment (Million)
1978	Rural	83.4	0.4	6.2	9.9	221.3
	Urban	15.3	0.8	28	57.9	49.2
1983	Rural	81.2	0.5	6.7	11.3	243.1
	Urban	14.6	1	26.7	57.1	59.6

1988	<i>Rural</i>	78.3	0.6	7.2	13.8	252.5
	<i>Urban</i>	13.4	1.2	26	58.9	69.5

**4. Agricultural Finance:** In the area of finance for the rural non-farm sector, India has followed a very distinct path. The development of the rural sector in India, including both agriculture and industry, has been mirrored by government initiatives in the provision of organized credit from banks and other financial institutions. As a key sector of the Indian economy, the RBI has historically allocated a key priority to the agricultural credit delivery. The RBI Act, 1934 envisaged a special developmental role for the RBI in the sphere of agricultural credit with responsibility, in particular, for financing seasonal operations and the marketing of crops. After the creation of NABARD, financial needs of State co-operative banks were mainly attended by the NABARD and attempts diverted effectively to consolidate the multi-agency flows of funds to the rural sector for generating effective use of funds to the growth of the agricultural sector. It may be noted that the rural nominal income as well as the flow of funds to the rural sector increased significantly. In sharp contrast to the above is the failure of the Department of Agriculture & Cooperation, GoI to utilize its funds allocated (Table 8). During the last decade 1992-2003, the said Dept fall short in utilizing average amount to the tune of approx. 235 crores each year in relation to the budgeted (planned) expenditures.

**Table 8 Plan Allocation & Expenditure of Department of Agriculture & Cooperation (Rs. Crores)**

Period	Planned	Actual	Deviation
1992	1041.35	957.86	-83.49
1993	1050	1214.88	164.88
1994	1330	1183.5	-146.5
1995	1405	1279.43	-125.57
1996	1490	1246.42	-243.58
1997	1471.25	1378.61	-92.64
1998	1431.25	1222.8	-208.45
1999	1956	1358.89	-597.11
2000	1956	1471.9	-484.1
2001	1965	1666.04	-298.96
2002	1985	1792.92	-192.08
2003	2167	1656.78	-510.22

Source: Compiled from the Annual Reports of the Dept of Agriculture & Cooperation, Various Issues.

The financial support by financial institutions also increased significantly (direct and indirect credit by 6 and 10 times respectively) during the last three decades (Table 9). The cooperative sector plays a major in deployment of both, direct and indirect credit to the agriculture sector supplying about 64% and 50% of the total loans in the pre as well as the post-reform periods respectively. The adoption of 'social control' as a policy measure in 1968 helped the RBI to motivate the commercial banks into the area of agriculture and rural credit on a significant scale. The National Credit Council, constituted in December 1967 and nationalization of the 14 major commercial banks in July 1969 helped the orientation of commercial banks lending policies and procedures to meet the requirements of the priority sectors of the economy with due to attention to the financing needs of the small farmers. The multi-agency approach covered the Lead Bank Scheme, which provided, boost to the improved flow of funds to agriculture sector through the organized credit channels. The Scheduled Commercial Banks

seconded the efforts of the Cooperative sector by financing approx. 28% of their total credit in the pre-reform periods, increasing it to the extent of 42% in the post-reform period. In the Indirect credit front however, the cooperative sector has maintained its relative significance as the major financier sanctioning over 80% of total loans in the pre as well as the post reform period respectively. Since the growth in the rural economy is an important driver of the economy as a whole, the study also attempts to have some idea about the dynamics of the rural income, primarily caused by the availability of funds. There is a growing critique about the role of directed credit in the government policy from the efficiency angle, both in terms of targeting as well delivery mechanisms, Editorial in Economic and Political Weekly (2004)

**Table 9 Compositional Trends in Direct & Indirect Agricultural Finance (% terms) 1971-02**

Period	Cooperative Sector		SCB's		RRB's		States	REC	Total Direct (Rs)	Total Indirect (Rs)

Notes & Source: Same as in Table 2

**Econometric Specification:** While a comprehensive review of government policy in the above regard is outside the scope of the present study, we test a simple OLS model to indicate evidence towards the supply leading approach to rural finance by hypothesising that the growth potential of any economic activity creates the demand for credit whilst, the availability of credit stimulates an economic agent to take up the economic activity. The growth variable is measured by the gross domestic product from agriculture and allied activities. Availability of funds is measured by the total credit accommodation to agricultural financing institutions. Crop production yield of all crops is measured by index of yield at base, triennium ending 1981-82 = 100.

The econometric function is given by

$$Y_i = \beta_0 + \beta_1 AFI_i + \beta_2 AAF_i + \beta_3 CRI_i + \beta_4 PREF_i + \mu_i$$

Wherein  $Y_i$  equals the GDP attributable to agriculture and allied activities,  $\beta_0$  is the intercept term,  $\mu_i$  the error term,  $AFI_i$  proxies the fund availability measured by the total credit allocation by the RBI to the agricultural financing institutions.  $AAF_i$  proxies Institutional credit for agriculture and allied activities is measured by the aggregate agricultural finance granted as depicted in Table 8,  $CRI_i$

measures all crop production yield, whilst  $PREF_i$  is the dummy variable and equals 1 to denote the pre-reform period, and 0 otherwise.

The Pearson Correlation and the regression estimates for 1970-71 to 2001-2002 yields following result

AGDP	AFI	AAF	CRI
0.92	0.93	0.86	0.89

$$Y_i = 81967.49 + 13.18 AFI + 5.07 AAF - 1141.59 CRI + 9.09 PREF$$

$$(2.14) \quad (1.97) \quad (4.65) \quad (-3.07) \quad (3.41)$$

$$Adjusted R Square = 0.94 \quad Durbin-Watson = 1.32$$

It could be observed that the correlations between AGDP (Agricultural GDP) and all other variables separately are all statistically significant. Thus the model was tested on OLS in level. The above model seems to be statistically and also in economic perception for key variables significant during 1971-2002. It is advocated that let the market be encouraged gradually to allocate the rural finance banking upon the sound rural production base and contributed by the institutional initiatives.

**5. Conclusion & Policy Implications:** The various policy initiatives and associated institutional arrangements that have been implemented in India in recent decades have influenced the performance of the rural farm & non-farm economy in a variety of ways. The resulting outcomes reflect that the comparative strengths and weaknesses of this sector will have a significant bearing on how the sector is able to respond to future challenges and opportunities. It is well recognized that the rural non-farm sector needs supporting infrastructure, both physical, financial and social for a sustained growth. The ongoing globalization and structural adjustment policies have played a key role in driving recent changes in rural economies across the developing world. With India joining the World Trade Organization (WTO), this large and growing economy exerts an increasing impact on world markets for goods as well as services. Trade liberalization in agriculture has the potential to reap rich dividends to developing countries, including India. To realize this potential, India must work toward establishing and strengthening a rules-based multilateral trading system through WTO negotiations. Rural development policy in both India has focused on agriculture, in policy formulation, allocation of public investments and recurrent budgets. Beginning earlier in India, these considerable investments in research, infrastructure, rural credit, and price support programs led to the launching of green revolution in rice and wheat production from the second half of the 1960's onwards, Fan, Hazell and Thorat (1999). As regards to commerce and services, the Indian rural economy specifically has a concentrated policy and support programs almost exclusively on manufacturing, and have largely ignored rural commerce and services. Instead, the bulk of policy attention has focused on rural industry and on related macro-economic policies. In spite of this policy de-emphasis, rural commerce and services have flourished, proving the most buoyant segments of the rural economy in India over the past two decades. Today, rural commerce and services are now roughly twice the size of the manufacturing sector in terms of employment. After liberalization, large-scale firms in India have reaped the benefits, while the village industry sector has suffered from low levels of labor productivity. Experience show that nominally defined secure property rights alone cannot guarantee the attraction of investment. Removing the distortions inherent in the economic system and introducing competition may have a more important role to play in the development of a vibrant rural economy. The first strategic decision must be to raise the level of public investment in agriculture and in rural India. This move would also help unleash private sector investment, which complements public investment. The strategy should be to contain and

target subsidies and plough the savings back into agriculture as investment. The rates of return to public investment in R&D have been as high as over 60% and in extension over 50%. India currently invests only about 0.5% of its agricultural GDP in agricultural research compared with 0.7% in the developing countries as a whole and as much as 2–3% in the developed countries. These figures suggest that government has been systematically under-investing in a sector that offers a high social return and that there is considerable scope for diverting incremental outlays to priority areas in research. Secondly, formation of policy in rural India is thought to be generally slower, as the democratic structure and various interest groups have to be taken on board before any radical shift in policy direction. The local governance in India was restricted to the state level until recently, and many policy decisions such as land reforms could not be completed in most parts of the country due to lack of political will. Thus, the issue of land reforms should be prioritized. Thirdly, in view of the fact that the agricultural allied activities is grossly neglected, the fishing and the forestry sub-sectors should be specifically emphasised through the relevant policies similarly, the exploitation of new opportunities to participate in the production and marketing of high-value livestock products, fruits and vegetables, and fishery are needed to bring rich dividends to the rural economy. Fourthly, the dramatic changes in rural India reflect a structural shift in Indian diets and also new market opportunities into higher-value activities. High-value agricultural products have higher employment elasticity and can be suitable for smallholders, if they can participate. Agricultural sector can be unleashed to produce the kinds of high-value foods and products that are now in high demand by India's growing middle classes and rural dwellers and also have export opportunities. Fifthly, the objective focus of initiating rural development programmes should by and large be confined in favour of the expansion of self-employment opportunities rather than wage-paid-casual employment. The rural people should be encouraged towards the establishment of various non-farm activities which offer area specific comparative advantages, though awaring the rural people about the sustainability nature of different enterprises in particular areas, providing subsidized financial assistance to meet the establishment costs, technological know-how to be used in the production processes and related assistance. Sixthly, the existing social safety net programs in India need to be revisited to assess their targeting mechanisms, coverage, cost-effectiveness, and overall impact on poverty alleviation. Several studies in India, shows that programs like the employment guarantee scheme (EGS) of Maharashtra to build rural infrastructure are more cost-effective in reaching the poor than is the untargeted public distribution system (PDS). These public works schemes need to be scaled up to build rural infrastructure, develop and preserve watersheds, undertake forestation, desilt canals *etc.* In India, the policy of protection and promotion of the rural sector in the eighties was followed by the sudden opening-up of the sector to competition in the early 1990s. Under the new competitive environment, most small farms & firms, especially those run by households with primitive technology, lost out badly in the period of competition and market integration that followed. The shakeout in the rural farm & non-farm sector is continuing even now. Although India has a more well-established network of rural credit, it suffers from inadequate delivery systems, which lead to bottlenecks in technological upgrading and output expansion.

### FDI IN MULTI-BRAND RETAIL: SOME ISSUES IN INDIAN CONTEXT

**Mr. S. A. Mule, Dr. A. T. Tawar & Dr. E.D. Korpakwad**

**Introduction:** In its attempt to demonstrate to foreign capital that it is committed to reform, UPA II allowed for the controversial fifty one per cent Foreign Direct Investments (FDI) in multi-brand retail sector with extensive debate in the parliament on December 05, 2012. Now, Finance Minister Arun Jaitley suggested that National Democratic Alliance (NDA) government would continue with the United Progressive Alliance (UPA) regime's policy of allowing foreign direct investment (FDI) in multi-brand retail, just as it had pursued India-US nuclear cooperation when in power, despite opposing it in 2008. In a pronounced signal from the government on FDI in multi-brand retail, Jaitley said the Bharatiya Janata Party (BJP) opposed FDI in this sector but governance involved elements of "responsibility" and "continuity". Therefore, the notification on the subject issued by the UPA government continued. The retail sector was included in WTO trade negotiations in 1995. The acceleration of retail FDI in the late 1990s primarily involved European and US retailers (mostly grocery/general merchandise operators) exporting capital, formats and expertise to, and developing store networks in, the emerging economies of East Asia, Latin America and Central/Eastern Europe. The emerging markets opened their economies for retailing in early 2000 for the Multinational Retailers. India opened the sector selectively in 1997 for cash and carry format and in 2011 allowed for fifty one per cent investments in single brand retail. The recent policy allowed 100 per cent foreign investment in single brand retailing. Now, Government may allow 100% FDI in multi-brand retail by foreign retailers like Wal-Mart and Carrefour if they agree to 30% local sourcing and employ 1,000 people for every \$100 million investment. The global "retail phenomenon" of the 1990s led by firms like Wal-Mart, Costco, Tesco, Giant, Makro, Carrefour, Aeon, Ahold, Aldi, Metro and others was a result of the material and cultural developments in advanced capitalist countries. Access to cheap capital, huge economies of scale in retail trade, progressive consolidation, purchasing power over suppliers, highly efficient sales forecasting techniques, transportation and replenishment systems (that incorporate state of the art in formation processing and supply chain logistic systems), expansion of the sub-urban population and spread of consumerism across all classes were some of these developments (Gereffi 1994; Arnold and Fischer 1994). On the other hand, the global retail phenomenon now spreading across emerging markets is supported primarily by the political economy of neoliberalism and only a few socio-economic developments comparable to those in advanced capitalist countries. The most noticeable changes are half a century of industrialisation, enlargement of the middleclass and growth of national monopoly capital. The changes have come with associated socio-cultural transformations, very swift urbanisation and impersonalisation of urban social relations, loss of old identities, a sense of new status definition and individuality asserted by purchase of mass produced, western designed, branded commodities (Warf and Chapman 2006). With rapid advances in mass media, and in the science of construction and manipulation of consumer consciousness, shopping has become a leading leisure activity. Class is now more often conceived in relation to competitive emulation in consumption rather than in relation to production. This feeds back into and strengthens existing global economic and power structures, leading

to a high degree of concentration and control by corporate retailers over both ends of the chain-manufacturing and consumption (Robinson 2004). These are broadly the conditions within which global retailers are locating themselves in developing countries. Intelligent regulation in emerging markets is conspicuous by its absence but it can hardly be overemphasised.

**Definitions:**

**Retail:** The Delhi High Court defined retail as sale of final consumption or sale to ultimate consumer. Retailing is the bridge between the manufacturers and the final consumer and falls in the last in the distribution chain having interface with the end customer.

**Organised retail:** It refers to trading activity undertaken by licensed retailers, those who have registered for VAT, Income tax etc. These include corporate backed hypermarkets, and retail chains and privately owned large retail business.

**Single brand retailing:** It refers to the selling of goods under a single brand name e.g. Reebok, Nokia, Amway etc.

**Multi brand retailing:** It refers to the selling multiple brands under one roof e.g. Big Bazaar, Shoppers Stop etc. These stores operate in different formats like hypermarket, food and grocery driven hypermarket, fashion and apparel etc.

**Retailing in India:** Traditional food and grocery retailing in India (which accounts for 70% of retailing) can be best described as dominated by small, privately-owned shops and hawkers and was largely community based (Kalhan 2007). This sector where almost all of the retail trade occurs is referred to as the unorganised sector. It employs 40 million people and contributes 10% of the gross domestic product (Kearney 2007). Over time, India has acquired about one retail outlet per 100 people, perhaps the highest retail density in the world. In metropolitan centres, modern and organised retailing has also had a large cooperative segment (encouraged by public policy in the 1960s to combat profiteering by private traders).

Wholesale food and grocery markets, consisting of private agents, have also been regulated and shaped by policy for the benefit of farmers and consumers from the district-level upwards in the form of agricultural produce and market committees (apmcs) or mandi; (wholesale markets). Parallel to the private sector is a large publicly funded procurement and distribution system (pds), retailing through outlet scalled"ration shops"where subsidised foodgrains are sold. Boston Consulting Group (2012) estimated that the Indian retail sales were \$ 471 billion with 7 per cent share for the organized retail (\$ 34 billion) in 2011. It also shows that by 2020 the size of the organized retail to be around \$ 260 billion with a penetration of 21 per cent. At present the sector is mostly served by unorganised sector with 12 million small and medium retail outlets and more than 80 per cent of these are run as small family business. These are the shabby stores, with goods being displayed without the slightest regard to aesthetics. These stores are growing 10 per cent per annum. Increasing middle class incomes and use of automobiles, refrigerators, credit cards and adoption of technology for supply chain is expected to shift the balance in favour of organized retail in metros and small towns. A large, growing, consumption-driven economy, saturation in developed markets, younger consumers, and a modern retail race that has not even seriously begun yet, is a once-in-a-half-century opportunity for foreign retailers. As per policy makers, the FDI in multi brand retail is expected to bring retail Know how and best practice, shopping experience, foreign capital, generate huge employment, investment in supply chain and backend operation mainly in food and grocery segment. But the government has hugely exaggerated the quantum and immediacy of benefits which can be argued.

**Perceived advantages and threats:** The policy of allowing FDI in Retail was pitched as policy for efficiency, employment generation, and value for money to the consumers, better experience of

shopping, better farm prices. The debate on this one was one of the intense in their history of Indian Parliament. We will see this one by one in the following sub-theme:

1. **Efficiency in the system:** It is argued that the foreign retailers will bring the required capital, technology and management skills which will bring efficiency in the retail sector. One of the measurements of efficiency is channel cost, which is measured as cost of distribution from producers to consumers. Surprisingly, it is found that the foreign organised retailers' channel cost is higher by 2 times to 9 times compared to retailers in India. FMCG products margin is in between 12 to 22 per cent. In US and Europe it is 40 per cent. In garments also the margin is 35 to 40 per cent whereas in foreign brand it is 5 to 9 times. Hence whatever may the efficiency in the system, it will be cornered by the retailers.
2. **Market concentration:** Market concentration has led to higher prices of food in 24 of 33 sectors in the US. As agricultural economist Robert Taylor testified to the Senate Agricultural Committee in 1999: since 1984 the real price of a market basket of food has increased by 2.8% while the farm value of the food has declined by 35.7%. This has consequences for farmers too (Taylor 1999).
3. **Small and Medium Enterprises (SMEs) :** Modern retailers are interested in saving cost. To do that, they will consolidate vendors. It is estimated that a large hypermarket is likely to have no more than 2,500 vendors, and apparel producers may have 100 vendors. Maximum only 40,000 SMEs with turnovers in the region of Rs.50 lakh to Rs. 2 crore, may get the orders. In India, we have 13 million SMEs, so it is just a drop in ocean. Above all, these retailers can reject the produced goods on the stringent quality norms. Moreover as discussed above, the policy tweaking can worsen the scenario.
4. **Farmers:** It is argued that the farmers will get better prices for their produce, particularly perishable vegetables, fruits. If estimated, to supply everyday vegetables to the top 40 cities, 2 lakh hectares of vegetable farm will be needed, which is just a small fraction of the 11 million hectares of vegetable farms India has. Again 2 lakh hectares of vegetables need just two lakh farmers. It is true that the farm-gate price is much less than the retail price in India. The main problem of Indian agriculture pertains to an increase in cost of cultivation, engineered by successive government policies, in terms of increasing fertiliser and power prices, lack of public investment in agriculture etc. FDI in retail will not solve this problem of the agrarian economy at all. Rather, with the introduction of firms like Walmart etc, a large number of

Intermediaries will be removed and the supply chain will be monopolised by the likes of Walmart. For the farmers, apart from a possible reduction in price, the other worry is with maintaining the quality of produce assigned by the super-markets, failing which the crop is rejected. In other words, supplying to the super-market chains is a risky business for the farmers, who are generally risk averse.

5. **Employment:** The estimated \$12 billion investment will generate 9 to 10 lakh new jobs. Again these are contract-type jobs- not employees with full benefits. The Indian retail sector is the second largest employer in India after agriculture, employing over 4 crore (40 million) persons most of whom are small unorganised or self-employed retailers. Some jobs in these categories will decrease. Hence net effect on employment is insignificant. According to a study, one Walmart store opening in USA reduces county-level retail employment by 150 and reduces county-level retail earnings by \$1.2million. In India rules governing working hours and the opening hour are yet to be put in place. Large format stores commonly remain open for 10 to 11 hours including on Sunday. This puts extreme upward pressure on the effective working hours of their workforce. Each state has its own shops and establishments law, which defines the rights and obligations of employees and

employers. They also include rules pertaining to working hours, closing and opening time, guidelines for rest, holidays, overtime, leave-casual, sickness and maternity benefits, employment of children and women, and employment and termination in general.

6. **Market power and Competition:** It is argued that the policy will increase competition in the system. It is observed that the organised players tend to collude and try to create a monopoly in the sector and it leads to the exploitation of consumers. Competition laws and enforcement are at the heart of retail regulation and they have been in a state of transition in India. Section 4 of the Competition (Amendment) Bill 2007, regulates abuse of dominance. To prove dominance of a corporate retailer, particularly multi product retailer, would not be simple because corporate retailers deal with many products and many geographical markets. Their dominance in one geographical market may be used to enter new markets, and to do so they may use a combination of predatory pricing and high promotional expenditure. To prove that a retail firm indulges in predatory practices, i.e., that it is selling below cost price may be difficult if it has vertical agreements with manufacturers or suppliers, and doubly so if such suppliers are located in foreign countries.

Nothing highlights the state of neglect of competition policy in recent times as much as the fact that while the commission held 44 cement companies guilty of cartelisation between February and April 1990, and began an inquiry in October 1990. It only gave its verdict 17 years later. And even then it could only direct the firms to desist from the practice. Proof of selling below cost and mala fide intent, however, requires inspection of internal documents and cost auditing which is difficult more so in the case of firms located abroad. There is also disagreement about which cost should be taken into account - the marginal cost, average variable costs or the average total cost.

Retailer	Annual revenue	Annual profit
Top 20	\$1.7 trillion	\$57.7 billion
Wal-mart	\$421 billion	\$16.3 billion
Target	\$67 billion	\$2.93 billion
Best buy		\$1.3 billion
Ikea	\$31 billion	\$3.85 billion
H&M	\$15 billion	\$2.33 billion

Wal-Mart is the global leader in food and grocery driven hypermarket in the world, which is supposed to be the biggest beneficiary of the current policy. The ruthless pursuit of cost and price cutting strategies of Wal-Mart made it to grow into a gigantic corporation. Fishman (2006) observes “The Wal-Mart effect is the suburbanization of shopping; the downward pressure on wages at all kinds of stores trying to compete with Wal-Mart; the consolidation of consumer product companies trying to compete with Wal-Mart’s scale; the relentless scrutiny of unnecessary costs that allows companies to survive on thinner profits; the success of a large business at the expense of its rivals and the way in which that succeeds builds on itself... In the same decade that Wal-Mart has come to dominate the grocery business in the United States, 31 supermarket chains have sought bankruptcy protection; 27 of these chains cite competition from Wal-Mart as a factor. That too is the Wal-Mart effect.”

The Enforcement Directorate has been probing Walmart’s investment of Rs 456 crore in Cedar Support Services Ltd, a subsidiary of Bharti Ventures, over alleged violations of FEMA rules.

Wal-Mart’s disclosure in the US is that it spent close to \$ 25 million (about Rs 125 crore) since 2008 on its various lobbying activities, including on issues related to “enhanced market access for investment in India”, created furore.

**Conclusion:** Strong regulation of the sector with adequate safeguard is needed to control the FDI in retail. The government has to maintain delicate balance between conflicting goals of promoting trade

competitiveness and economic efficiency on the one hand and defending the interests of smaller firms, environmental interest groups and consumers on the other. Countries like Indonesia, Thailand and Malaysia, which up to the 1990s had a laissez-faire policy towards the retail sector regulations, are now moving in the direction of increasing restrictions on large format retail using a combination of laws and regulations, to impose restrictions on the proliferation of multinational retailers, large-format shops and the domination of the market by a small number of retailers. In many instances these drives are being impelled by indigenous retailers (Coe and Wrigley 2007: 362f). German competition policies in content and implementation are significant for India to the extent that they are different from other advanced retailing countries like the US and Great Britain. German policy now proactively aims to preserve small and medium competitors in the retail sector. As stated earlier, the government has hugely exaggerated the quantum and immediacy of benefits. The government can put some invisible barriers like location, price size, and working hours as in Japan, Germany, Malaysia and Indonesia and regulate it through competition commission of India.

## **WORKPLACE STRESS OF EMPLOYEES**

**Ms. Snehal D. Bhosale**

*Assistant Professor, Secab Institute of BBA, BCA, BA & B.com, Vijayapur, Karnataka*

**Introduction:** Stress is a biological term which refers to the consequences of the failure of a human body to respond appropriately to emotional or physical threats to the organism, whether actual or imagined. Stress refers to the strain from the conflict between our external environment and us, leading to emotional and physical pressure. In our fast paced world, it is impossible to live without stress, whether you are a student or a working adult. There is both positive and negative stress, depending on each individual's unique perception of the tension between the two forces. Stress at work is a relatively new phenomenon of modern lifestyles. The nature of work has gone through drastic changes over the last century and it is still changing at whirlwind speed. They have touched almost all professions, starting from an artist to a surgeon, or a commercial pilot to sales executive. Stress at workplace has a negative impact on the performance of the employees. In other words, higher the stress, lower the performance. Before it was believed that moderate levels of stress would energize employees and enhances their performance. But this belief is not held true now. The assumption valid now is the performance will be disrupted even by the low level of stress. There are some valid reasons for this statement they are

- Even relatively mild stress distracts an employee. Individuals experiencing stress tend to focus on the unpleasant feeling and emotions rather than on the task at hand and as a result their performance suffers.
- Prolonged or repeated exposure even to mild level of stress may have harmful effects on health and this may interfere with effective performance.
- Finally, a large body of research indicates that arousal increases, task performance may at first rise, but at the same point begins to fall.

**Definition of stress:** The word stress is derived from the Latin word “stringere” which meant literally to draw tight and was used in the 17<sup>th</sup> century to describe hardship, strain, adversity or affliction. These root words refer to the internal feelings of constriction may feel under stress. During the late 18<sup>th</sup> century, stress denoted “force, pressure, strain or strong effort, referring primarily to an individual organs or mental powers. Gale Encyclopedia of Mental Disorders (2003) on the other hand, states “stress is a term that refers to the sum of the physical, mental and emotional strains or tensions on a person. Feelings of stress in humans result from interactions between persons and their environment that are perceived as straining or exceeding their adaptive capacities and threatening their well-being. The element of perception indicates that human stress responses reflect differences in personality as well as differences in physical strength or health”. The American Heritage Dictionary of the English Language (2009) defines stress as “a mentally or emotionally disruptive or upsetting condition occurring in response to adverse external influences and capable of affecting physical health, usually characterized by increased heart rate, a rise in blood pressure, muscular tension, irritability and depression”.

### **Sources of Stress**

**The Environment:** The environmental stressors such as weather, noise, crowding, pollution, traffic, unsafe and substandard housing, and crime.

**Social Stressors:** Social stressors such as deadlines, financial problems, job interviews, presentations, disagreements, demands for your time and attention, loss of a loved one, divorce, and co-parenting.

These stressors arise due to demands of the different social roles such as parent, spouse, caregiver, and employee.

**Physiological:** Physiological stressors include rapid growth of adolescence, illness, aging, giving birth, accidents, lack of exercise, poor nutrition, and sleep disturbances.

**Thoughts:** Human brain interprets and perceives situation as stressful, difficult, painful or pleasant, in such situation our brain determines whether they are problems to us or not.

**Types of Stress**

a) **Eustress:** These are also known as Positive Stress, which makes us to feel good and exerting healthy effect. This type of Stress occurs short period of time. Eustress gives ability to person to generate optimum output by performing best. In such situation person may thrilled, excited while watching Horror Movie, Excited when won the Prize, Zeal for purchasing first car, happiness in accomplishing challenges, etc.

b) **Distress:** This is called as Negative Stress, bad stress. This is opposite to Eustress. Death of someone you love, Illness, Financial crisis, Heavy work load etc, leads to Distress. It has two types such as Acute Stress and chronic Stress.

c) **Hyper-Stress:** If the person pushed beyond what one can handle, which turns in to Hyper-stress. More times it occurs because workload or over worked. This type of stress occurs when constant heavy financial difficulties, work both at home and office, Continuous tension, travelling day and night etc.

d) **Hypostress:** This is directly opposite to Hyperstress. This type of stress experienced by people when they constantly feel bored, same task over and over again, restless work and lack of inspiration.

**Causes of Stress:** Causes can be broadly divide in to three

Organizational Factors	Personality Factors	Work family interaction Factors
Job it shelf	Age	Work demands
Poor physical working conditions	Sex	Family demands
Work overload	Headache	Work flexibility
Time pressures	Personality	Pressures at work
Long working hours	Control & decision making capacity	Support at work
Job Instability	Physical agents	Work & Family life
Job Clarity	Depression	

**Methods of Managing Stress**

**1. Organizational strategies for managing stress**

- Encouraging more of organizational communication with the employees so that there is no role ambiguity/conflict. Effective communication can also change employee views. Managers can use better signs and symbols which are not misinterpreted by the employees.
- Encourage employees’ participation in decision-making. This will reduce role stress.
- Grant the employees greater independence, meaningful and timely feedback, and greater responsibility.
- The organizational goals should be realistic, stimulating and particular. The employees must be given feedback on how well they are heading towards these goals.
- Encourage decentralization.
- Have a fair and just distribution of incentives and salary structure.
- Promote job rotation and job enrichment.
- Create a just and safe working environment.

- Have effective hiring and orientation procedure.
- Appreciate the employees on accomplishing and over-exceeding their targets.

## 2. Individual strategies for managing stress

- The employees should make a “to-do” list daily, prioritize the acts in the list and plan the acts accordingly. Take regular breaks during work to relax you. By effective time management, the employees can achieve their targets timely and can meet work pressures and, thus, avoid stress.
- Do hard work. Strive to achieve your goals but do not do it to the harm of family, health, or peer.
- Indulge in physical exercises. It helps in effective blood circulation, keeps you fit, diverts mind from work pressures.
- Encourage a healthy lifestyle. Take a regular sleep, have plenty of water, have healthy eating habits. Promote relaxation techniques such as yoga, listening music and meditation.
- The employees should have optimistic approach about their work. They should avoid connections with negative approach employees.
- The employees should have emotional intelligence at workplace. They should have self-awareness, self-confidence and self-control at workplace.
- The employees should build social support. They should have close connections with trustworthy peer who can listen to their problems and boost their confidence level. This social network will help the employees to overcome stress.
- Employee counseling is a very good strategy to overcome employee stress. Through counseling, employees can become aware of their strengths and how to develop those strengths; their weaknesses and how to eliminate them; and they can develop strategies for changing their behavior. Employees are also given career counseling which helps in reducing their ambiguities with regard to career.
- Find a fun way to release stress, such as, cracking jokes, playing tennis, golf, etc.
- Do not remain pre-occupied with yourself. Turn your focus outwards. Help others. This will release some stress.

**Conclusion:** Stress is a naturally occurring phenomenon which can act as a motivator under the right circumstances. However, like so many other things in life, an excess of stress will have negative consequences with repercussions that will transcend personal and professional confines. Left untreated, excessive stress will ruin an individual's health and productivity. It's the responsibility of leaders and managers, to identify the various sources and types of stress. Furthermore, even have the capacity to take action aimed at stemming these sources and types of stress. However, first we must be able to recognize the signs and symptoms of stress in order to effect the appropriate organizational changes. And, in cases where either the solution resides outside of our sphere of influence or, to help cope with residual stress, is it essential that we understand the various coping mechanisms available and help individuals select the most appropriate ones.

## **DYNAMIC AND HOLISTIC APPROACH TOWARDS VIABRANT MANAGEMENT EDUCATION IN INDIA**

**Dr. S. Y. Patil**

*Ex.-Director, Godavari Institute of Management & Research, Jalgaon, M.S, India 425001*

**Introduction:** Education is a unique feature that plays the most dominant role in the life and evolution of mankind. A man who is fully and really educated is the real human resource and is considered as an important, valuable and tangible asset to a country. The socio-economic development of a country depends upon such real valuable assets. All types of education (Primary, Secondary, Higher Secondary College, University /Higher Education) play a vital role in shaping, sharpening and refining the personality of the individual. Education plays a very important role in the human life cycle because it provides ideas and human resources to create a dynamic ideal future. Higher Education provides ideal future, proper and adequate solutions to each activity of human beings, trade commerce agriculture industry socio-economic and spiritual culture, administration, services and the quality of overall environment.

Education is an essential tool for achieving economic sustainable development. People around the world recognized that current economic development trends are not sustainable and the key to moving society towards sustainability are public awareness, education and training. Considering this view higher education institutes specially IIT's and IIM's play a major role in improving the environment, preserving natural resources and making economic and social impact. These institutes can help to promote new and sustainable ways of living, working producing and travelling that will help to achieve wider benefits to human health and well-being.

### **Role of Management in Economic Development :**

**Management – A Conceptual Overview:** Let me pose a fundamental question here. Who discovered management? To answer the question, I must take recourse to an incident according to which someone asked Marshall McLuhan, "Who discovered water?" Pat came the response from the media guru, said, "Certainly not God". God is omnipresent, omniscient and omnipotent so he needs no management Man needs management because man is vulnerable. Vulnerability of man against human and natural forces of chaos and the inherent individual and collective social desire of re-attaining order and progress are pre-requisites of management. Manu and Satrupa, and Adam and Eve and their subsequent generations needed management in one form or the other. Man, with which incidentally opens the term management, needs it to fulfill individual and social obligations and thereby climb a few rungs of the ladder of progress and have the name etched in the cultural memory. The Latin word 'Manage' stands for 'Training Horses' through exercise. Even before the term came into existence, there were cultural encyclopedias like the Ramanya', & the Mahabharata, Plato's The Republic and Kavitya's. The Arthashastra which are primarily about political and economic management. The management science and principles developed especially after Industrial Revolution. The post industrial society is known as post manager's society.

**Basic Functions of Management :** Management has to perform some important basic functions such as :

**Planning:** Planning deciding what should be happening in the future and generating policies for action.

**Organizing:** (Implementation) making most favorable use of the resources necessary for the successful execution of plans.

**Staffing :** Staffing job analyzing, recruitment and employing individuals for apt jobs.

**Leading:** Leading / Directing determining what needs to be done in a situation and getting man source to do it.

**Controlling:** Controlling / Monitoring inspecting the progress against plans.

Business management activities include Design, Modeling, Execution, Monitoring, and Optimization.

**Dynamic Approach Towards Vibrant Management Education in India :** As the environment of business has become more complex there is increasing demand for managers with the necessary skills, understanding and energy to tackle to difficult demand facing the organization of all kinds. We require management degrees. Formerly, management was known as managing the people and getting work done by people but to day it is more than this. Therefore we should change overall the concept of management and its application to business schools rather than mere change in outer infrastructure.

**Emerging Problems of Management Education in India:** Education is the Third largest industry in the world. Emergence of knowledge economy is the result of Globalization. “A Knowledge –driven economy is one in which the generation and exploitation of knowledge play the predominant part in the creation of wealth” (United Kingdom Department o Trade and Industry, 1998). Education is the Third largest Industry in the world. There are number of problems of higher education in India after independence some of the problems became very crucial in the Era of reforms. WTO no doubt has created opportunities at the same time it has also created some challenges which can be mentioned as :

**i) Diminishing Total Expenditure on management education during plan periods :** It is observed that government has been spending a very negligible amount on management education in India. The total number of IIMs is an indicator of the statement. It has providing very much scope for increasing participation of the private sector in management education.

**ii) Lack of Equalization of educational access and opportunities :** It is observed that over all enrollment of girls is stagnating around 40% for past several years with only 5.4 % girl students doing medicine and engineering courses. Likewise the % of SC/ST category students has also decreased. This shows a gender imbalance in higher education.

**iii) Proliferation of Private Management Education :** We find that the share of private participation in management education has increased from 80% to 85% during 1980-2001 & upto 90% 2009-10. Private management education institutions are considered as the sources of income. The Proliferation of private management education Institution has created financial problems for poor people in society.

**iv) Inadequate Infrastructure and facilities :** It is observed that there is inadequate infrastructure and facilities in about 60% private management institutes like lack of building, library, / laboratory facilities lack of computer lab and other related facilities large vacancies in faculty and poor faculty overcrowded classrooms , lack of Hostel, canteen, transportation etc. facilities

**v) Low quality of Research :** Research is an endeavor to promote quantitative improvement of what is already known and an exercise to investigate the theory, Research is a systematic control, empirical investigation of hypothetical proposition about presumed relations in a phenomenon.

The ultimate aim of social research should be to make the society prosperous through creative construction and remediation. It should attempt to appreciate the past, describe the present and predict and control the future.

**vi) Inadequate and Diminishing Financial support for Management Education from the Government and society.:** It is observed that, Government of India is not financing adequately to Higher education institutions. Some of the State Government like Maharashtra have not disbursed non-

salary grants to higher education institutions for the last 20 year therefore most of the universities and colleges are in a financial crunch.

Today our expenditure on education is less than 4% G.D.P. has resulted into inadequate infrastructure facilities and in its turn leading to low quality of research.

**vii) Excessive Control of Regulatory Bodies :** Management Education in India is co-ordinate by several agencies like – UGC, AICTE, DTE, in every states. There is a large scale overlapping of their functions with the functions of UGC. Further, there are also overlapping in functions of National Council and State Councils. There is much interference exerted by various regulatory bodies that would result in discouraging the initiative and autonomy. Existing regulatory procedures are extremely burdensome and counter-productive. These regulatory procedures are time consuming non-transparent and complex procedure applied arbitrarily, create conducive environment for rent seeking and patronage. It makes management education institutions less credible. Compulsory and dysfunctional regulatory arrangements for higher education in India have raised serious concerns about their credibility.

**viii) Lack of Industry Institution Linkage:** It is observed that most of the management schools do not have direct linkage with the industrial sector. Therefore, placements of students of these schools are not at increasing rates. Actually the recognition of any B-Schools lie in the placement rate. Therefore, in order to be a vibrant management school , industrialists and educational entrepreneurs should work together to foster real industrial development of the region.

**ix) Quantitative Growth in Management Education-** Due to above mentioned problems and absence of a well informed reform agenda for management education. We have achieved quantitative growth rather than qualitative growth in management education. Quality of higher education in India has been reduced due to the low quality of teachers, their negative zeal, enthusiasm, and motivation lack of accountability of teachers and non-performance of their duties are the important reasons of low quality education of India.

**x) Deteriorating standards -** Due to above reasons the standard, of management education is deteriorating day by day. Some of the institutes are known as factories of Diplomas/ Degrees which do not have no any market / social value.

**9) Dynamic Approach Towards Management Education in India:** India has made significant achievement in the development of management education which has contributed to economic growth and development while the achievements are impressive the failures are also numerous and shaking. It is, therefore, necessary to give top priority to management education to create an environment the maintenance of the quality of management education on one hand and to compete with the other countries on the other. This requires a dynamic approach towards management education.

**i) Removal of financial constraints –** Government should give top priority to management education in planning and remove all financial barriers and should increase the expenditure on education up to about 20% of the G.D.P. with globalization and liberalization of the domestic economy. Management Education Institutions should generate alternative sources for self-financing like-foundation courses, Certificate / Diploma courses Tree-Plantation, Shopping Complex, etc.

**ii) Autonomy and Affordability –** We should give academic and financial autonomy to all management education institutions India. Dr. Ahluwalia Dy. Chairman of Planning commission has assured to give financial autonomy to management education in India. Dr. Sam Pitroda, Chairman of National Knowledge Commission of India has recommended to increase management Education fees by 20% but at the same time they are also recommended free ship to needy students and scholarship for meritorious students. Further, student loan schemes should be introduced for needy students.

**iii) Education as Productive Investment** - Education is defined as the investment of current time and resources for future economies. It holds the key to economic growth for it acts both as an agent of change and as an input. Many studies have been made from time to time all over the world to assess the contribution of public expenditure on education to economic growth. Notable among them are, the studies made by Backer, Denison, Dholakia, Herbison and Myers, Mukherji and Krishna Rao, Schultz, Solow, Tilak and Todaro. In recent years the experience of three countries Finland Italy and Belgium have once again proved the positive association between education and economic growth.

**iv) Access and Equity**- The access and equity of management education should be based on the simple principle that no talented and deserving person should be denied access to management education. Management education should be based on merit and desire and not economic social or influential forces.

**v) Change in Course Structure/Avenues of Management Education** :It is observed that most of the business schools have adopted traditional pattern of management education where these institutes are stippled in to theory rather than practical real world application. They focus only on hard skills related to traditional lines of faineance, marketing, HR. Therefore they should change their course structure and should offer management programs in software enterprises, public and policy management, executive management programs, distance mode management programs, foreign trend management, Telecom and IT management, pharmaceutical management, tourism and hospitality management, hospital administration, creases and risk management, disaster management, energy and agricultural management. Today national and international corporate sector is expecting dynamic and innovative management models, theories and principals therefore such type of courses should be incorporated in present management education system in India.

**vi) Adoption of value/ethics based management education** :Today we are at crossroad, where a deep introspection is required in fine tuning where the curriculum and focus more on moral leadership. The sub-prime crises in the states, Satyam scam in India, stamp paper scam, Adarsha building scam, 2G Spectrum Telecom scam, etc. have focused on moral and ethical condenses in present management education system. This has led to the inclusion of credit courses on ethics and corporate social responsibility. We should teach management lesson from the Ramayana and Bhagawat Geeta to make them conscious of their responsibility toward the society. This is where the east course over the west, our value go back several centuries and we are endowed with a wealth of literature which servers as a guiding principal.

**vii) Quality Assurance** – Need for an Independent Accreditation System- There is a need for an independent accreditation agency with a conglomerate of govt. industry academia, society etc. Accreditation should be encouraged to levy management tuition fees from those who can afford compared to those who do not receive. It is also important that all institutes of management learning must make public the actability of their courses and degrees that is the status, recognition acceptability of their courses by other institutions.

**viii) Strategy for Quality** –Quality improvement up gradation and maintenance are the central plan of the new economic policy. Globalization has compelled us to create quality in higher education to compete with other countries. This requires improvement in the educational infrastructure modernization of existing reputed educational testing services such as CAT, GATE, JEE, NET and other must be upgraded and modernized to compete with foreign testing services such as GRE, GMAT, and TOFEL.

**ix) Triggering Innovation Entrepreneurship, Leadership and Social Engagement:** If we want to be vibrant in economy specially in corporate sector . Our all action should speak louder than

words. We should change our pedagogic structure in such a way that ,we should innovation ,entrepreneurship and social engagement in such a way that, these schools should focus on innovation entrepreneurship, leadership on one hand and social responsibility , inclusive sustainable development (rural and urban) on the other.

**x) Globalization of Indian Education** -We should globalize our education system. Main objectives of globalization of Indian Higher education should be learning for learning, learning for work

To make it a major source of earning foreign exchange.

To improve quality Indian education and

To spread Indian culture and value

**xi) Vocationalization of Education-** Present Indian higher education system has failed to generate maximum employment opportunities therefore Vocationalization of education should be done through- Co-coordinating industry and the academic institution

Implementing quality development programmers in institution

Independent accreditation of institution

Modification of syllabi considering the local need and global vision.

Public – Private partnership and institution – Industry interface.

#### **Dynamic & Innovative Steps**

#### **Adoption and Implementation of Ant Philosophy :**

- i) Ant Philosophy is very dynamic positive future oriented and Hitler Based .
- ii) Ants don't tire , they don't escape from work.
- iii) Ants think about rainy season during summer.
- iv) Ants think about summer season during winter.
- v) Ants are very practical and opportunists.
- vi) Ants Do's and do as it is possible.
- vii) Ants think positively for long/future perceptively.

**Keep Moving :-** Every Morning in Africa a Deer wakes up. It knows it must run faster than the fastest lion or It will be killed. Every Morning in Africa a Lion wakes up. It knows it must run fastest than the slowest Deer. Or it will starve to death. It does not matter if you are a lion or deer when sun comes up you should better be running. E.g. Keshav Suta.

#### **Simple message to managements students**

“Do not let the events of the times,

Blur your vision of the future,

Or inject in it any traces of cynicism,

Urge you to recall our unifying ethos and

Tradition from where the world is learning best management education”.

#### **Last but not the least, we should follow the Chinese golden wisdom**

If you are planning for one year, plant grains

If you are planning for ten years, plant trees

If you are planning for 100 years plant Men

Indicates that man is a measure of all things and manpower planning is always a long term process.

Ancient Indian Philosophy has also recognized the importance of human resource in development.

Therefore we should give top priority to human resource and in its turn to education in planning and implement it on qualitative ground.

**Dr. S. Radhakrishnan** once said that,

Education enabled the man to soar high up into the space.  
Education enabled the man to dive deep in to the ocean,  
However education has not been able, to make man suitable to live on this earth,  
Indeed, we crave for such education that would make a man a worthy inhabitant of this Globe.

## **ROLE OF M-TECHNOLOGIES IN TEACHING AND LEARNING**

**Jaywant Ramdas Bhadane**

*K.R.Aher Arts, Sci. and Comm. College Deola, Dist:Nashik*

**Introduction:** Today, the way of learning is being changed slowly from traditional methods to modern methods. Means Teacher oriented methods to student's oriented methods. The student oriented instruction method is used on the intensive participation of students on the Teaching-Learning programme supported by latest available information Technology. Over the past few years, there has been a large investment in information and communication technology in the teaching and learning process. In this context, Mobile Technologies, including smart phones and tablets emerges an innovative tool associated with different methods and strategies. M-technologies are technological products and, now a days, a very representative number of so-called "digital generations" won and use them in our day to day in recreational and educational activities. Today's students are techno savvy. They get more engaged and really thrive when they are using mobile devices in the classroom. The society is undergoing a radical change in the way they communicate and act, since many activity sectors i.e. agriculture, education, industry, finance, healthcare etc. are adopting the use of mobile technology to deliver various services. Education is a continuous, complex, dynamic and life long process, now a day M-technology occupies the prominent place in teaching learning processes. The purpose of M-Technology is to improve the effectiveness of teaching-learning process in formal or informal setting and to utilize scientific principle. This paper deals with impact of mobile technology over the teaching learning process in general and the technology which is supported to our teaching and learning. The study is set to find out how students are improving their studies with the help of available latest information technology materials and to know awareness of students towards the usage of advanced teaching learning materials.

**Impact of Mobile on the Teaching Learning programme:** Education is a tool to develop humankind in so many ways. Therefore, education is being given to students by different methods. The aim of any method is to make the learning process most effective. The recent trend is more from a teacher centered to student centered instruction. Teacher can use computers to manage the whole institutional process from lesson plan to evaluation of student's performances. Refresher and Orientation courses and workshops on the effective teaching with modern available information technology are useful only when they have been learned and implemented in the real class room. The number of mobile internet users in India are estimated to reach around 420 million by June 2017 with the rural India growing at a much higher rate than urban India says a published by Internet and Mobile Association of India (IAMAI) & market research firm IMRB. According to a report titled Mobile Internet in India 2016, there were 389 million mobile internet users in India as on December 2016.

**Importance of M-Technology in Classroom:** M-Technology is powerful and it can be used in several great ways to make teaching and learning powerful. What can be done and what cannot be done is limited, basically by the creativity of the user. So, the more creative and innovative we get, the more results we'll see with using technology in class. However, I will provide a few examples just to help you get an idea of what an effective use will look like, Use of audio recording. Students often require personal and quality feedback on the work they turn in. Lecturers can make use of the audio recording feature built into most Smartphones to provide these personal any yet quality feedback to all students. Research has proven that students not just liked feedback given this way, but even preferred it. Today's

students have grown up with technology as the air they breathe, are used to being wired 24/7, are comfortable multi-tasking in multi-media, and bring very different expectations to the classroom as a result. The physical boundaries of the classroom and time for learning no longer prevail because the content is ubiquitous, students can communicate with teachers, other students and anyone else to satisfy their need for knowledge using the new generation of mobile devices, digital media players, Smartphone's, personal digital assistants, and tablet computers. Students are confident that with their mobile devices, they will not be stranded and will be able to find anything they want to find, right at the time they need it. Whether is general information on the internet or its information related to their subject, the mobile device helps students achieve it faster?

**Benefits of M-Technology:** M-Technology is a social rather than technical phenomenon of people on the move, constructing spontaneous learning contexts and advancing through everyday life by negotiating knowledge and meanings through interactions with settings, People and technology. It is perhaps the fastest growth area in the whole field of ICTs in education. It covers any form of learning that is mediated through a mobile or, more precisely, mobile handheld, device. Many Higher Education Institutions are implementing Mobile learning to provide flexibility in learning. Using mobile devices to reach students will benefit higher education by increasing enrolment and having a broader student population, since students in different age groups will be able to access course materials anywhere and anytime.

Some students are from rural area, the student knowing how to appropriately use mobile devices is an important aspect in this increasingly connected world and they can be update. Having mobile devices in the classroom allows students instant access to the latest news, information, statistics, etc. Virtually every question they have is at their fingertips, keeping them connected with what's going on around them and ensuring they are always well informed with the most up to date information on the contrary. Textbooks can't provide students with the latest information like a mobile devices can. Also having digital textbooks on their mobile devices keeps students more organized and gives them easy access to their materials. No one likes lugging around big textbooks. Many digital textbooks are constantly updated and often more vivid, helpful, creative and a lot cheaper than those old heavy books.

M-Learning as Meaningful learning that occurs through the use of wireless handheld devices. Students are always on the go and have activities according to the context in which they are teaching and learning environment using mobile devices provide opportunities for innovation. The Teaching Learning Process, in which students have an active role and teachers and students interact in a collaborative way, the construction of knowledge is facilitated, mobile application help coordinate learning resources and students, any may also help to improve the educational activities. Having those learning apps, digital textbooks, etc, on mobile devices allows them to get in extra studying and learning in during downtime. They can carry their books and notes with them at all times and have instant access to materials. If students are really excited and engaged in learning inside of the classroom, they are likely to continue learning outside of the classroom and they can do so with M-Technology. It is remarkable how mobile technology can transform education into something more enthralling and engaging then you could have ever imagined.

**Using M-Technology in an effective way:** By Practice, I start every academic year by asking my students if they have a Smartphone. I ask them how many of them use SMS text to communicate. To their surprise, I then tell them to take out their phones and leave them on the bench, because we have to use WhatsApp for communicating curriculum issues related to subject. Sometimes I try to work in problems to solve or I share apps or learning tricks utilizing various technologies. Anecdotally, I have found that by teaching and learning through mobiles, students have become more engaged in my class.

I supply various notes of my subject by PDF form on student's mobile phones. At that time I used e-mail or WhatsApp medium. I give some relevant clips regarding the subjects on mobiles. I experienced that such clips are beneficial for the students everywhere, every time. Students also come in wanting to share new technologies and resources they have found that have helped them learn. So M-Technology is really important in the life of students

**Conclusion:**Over the past decades, it has been recognized the added value of the use of technological tools in the classroom and since then, efforts have been made by different stakeholders in the field of education, including scientific community and governments in order to generalize its use and consequently improve the Teaching Learning Process. There are several more ways by which both students and teachers can creatively use M-Technology in the classroom. Again, technology is powerful and its benefits go beyond just making our work efficient. It can increase productivity and help us achieve greater results in our work, thereby making us effective. It clearly shows that there are many advantages and disadvantages for M-Technology and traditional learning. But M-Learning has more benefited than traditional learning. All teachers have to be requested for teaching to be made effective by using available information technology materials, It is noticed that the role of educational administration and management in the educational instructions. To sum up, Bill Gates says that, "Technology is just a tool. In terms of getting the kids working together and motivating them, the teacher is most important". In this way, we can prove that modern technology is very pertinent tool in calculating education.

## **GRAPES EXPORT PROMOTION THROUGH CO-OPERATIVE MAHAGRAPES**

**Dr. Andge Shashikant Chandrakant**

*Nagnath Jr.College, Mohol. Dist. Solapur*

**1.1 Introduction:** In the agriculture marketing system, private exporters or commission agents used to buy fruits of best quality from the growers. They pack them in the boxes to export or sell them to the customers in domestic markets. At many places, commission agents or wholesale merchants purchase the fruits in bulk on their own account for local sale. Local merchants sell their fruits in cities like Mumbai, Pune etc. or in a wholesale market. Long chain of middlemen in this type of marketing affects the growers to receive lesser returns. Moreover, lack of inadequate infrastructural facilities such as grading, packing, pre-cooling and cold storages in the production area and also lack of efficient logistic system like refer vans to transport fruits and vegetables to various cities, results in a heavy loss to growers in quantity as well as quality. This inadequacy is a major bottleneck to grab the opportunities in potential markets, which leads to sell of fruits and vegetables in the nearby wholesale markets and APMCs. Moreover, growers are also unorganized and in absence of marketable surplus in a bulk quantity, growers are constrained with the lesser returns and middleman continues to exploit the small & marginal growers in peak season. If the efforts would be made to organize the growers in groups or co-operatives or in Farmers Producers Organizations (FPOs), growers would certainly have a sizable bulk quantity to deal with the buyers or processors with a sufficient bargain power which would help them to fetch remunerative prices. In addition to this, if efforts were made to divert surplus produce to the global markets growers would get the fair and remunerative prices in the domestic market, and export will bring the premium prices for they deserves. Accordingly, MASMB had taken initiative to federate the Primary Agriculture Co-operative Marketing Societies (PACMS) in to the Apex (partnership) cooperative societies for various fruits.

**1.2 Research Methodology:** This study used the following research methodology.

**a) Objectives of the Study**

- 1) To evaluate the Government policy related to MAHAGRAPES and different schemes for the promotion of grapes production and export.
- 2) To assess the scope for the export of grapes produce from the MAHAGRAPES and necessary steps to increase it in the future.

**b) Data Collection:** Secondary data is collected through a number of reference books, MSAMBs reports, national and international reports, articles, seminar proceedings, major research study reports, magazines and internet literature, etc.

**c) Data analysis:** The collected Secondary data is classified and analyzed carefully with the help of appropriate statistical techniques like measurement of central tendencies, percentages, standard deviations and Microsoft office on computer for arriving at statistical inferences.

### **1.3 Export Policy of Primary Agricultural Cooperative Marketing Societies (PACMS)**

The Agro-climatic conditions in Maharashtra are less suited for achieving competitive advantage in food grain production. However, it has considerable advantage in horticultural and floricultural crops. Maharashtra is a leading exporter of several horticultural produces, it includes grapes (Sonaka, Thomson seedless, TAS Ganesh), Mango (Alphonso, Kesar), Pomegranate (Bhagva, Arakta, Ganesh)

etc. Most of these exports are undertaken by the traders. Recently, the Primary Agricultural Marketing Societies have come forward for export of produce from their member farmers.

The following table gives some details about export markets for horticultural produce like grapes, mango, banana, orange and pomegranate. (See Table 1.1)

Table 1.1 : Details of Export Markets for Horticultural Production			
Crop	Varieties	Markets	Comments
Grapes	Sonaka	Gulf countries	Highest potential in long run for export.
	Black seedless	Europe	Well exported area and post-harvest technology
	Saga gold	Europe	Sea transport possible.
Mango	Alphanso	China, South USA, Gulf, East Asia, Europe, Middle East	Too short season Sea transport not yet successful Very attractive domestic market
	Totapuri, Kesar, Neelam	South East, USA, Japan	Limited production Sea transport possible Post-harvest Technology stabilized
Pomegranate	Bhagwa	South East, U.K., Germany	Improvement in post-harvest handling, packing and transportation required. Correction in sugar acid ratio.
Banana	G-9	Europe	Neither production nor post-harvest technology established.
Orange	Nagpur King	Europe	Poor keeping quality. Loose jacket fruits, colour not attractive Post-harvest technology not established Bitterness in juice develops Good as a table fruit Variety replacement necessary

#### 1.4 Profile of Farmers Organization and MSAMB

MSAMB has promoted five such apex (partnership) cooperative bodies namely MAHAGRAPES, MAHAMANGO, MAHABANANA, MAHAANAR, MAHAORANGE. Detail of these apex societies are as follows.

Table 1.2 : Profile of Farmers Organization						
S.N	Profile of Organization	Organisation				
		MAHAGRAPES	MAHAMANGO	MAHABANANA	MAHAANAR	MAHAORANGE
1	Date of Establishment	19th Jan, 1991	8th March, 1991	1st Jan, 2002	5th Aug, 2005	10th March 2008
2	No. of Partnership	16	26	23	6	6
3	Maharashtra area in Lakh Hectors	8.6	4.77	0.82	0.82	1.28

10	Global gap / Europe Gap certification	36	NA	NA	40	NA
<b>Source:</b> Bijay Kumar(2011), Indian Horticulture Database data base -2011, Ministry of Agriculture, Gurgaon-122015, pp.36-134.						

MSAMB is acting as a Nodal Agency and guide the member farmers of this apex society's i.e. Grapes, Mango, Banana, Pomegranate and Mandarins through Primary Agricultural Cooperative Marketing Societies (PACMS). The PACMS will have direct linkage with their member farmers. The PACMS will create infrastructural facilities for which the expert advice will be given by MSAMB.

### 1.5 Objectives of MSAMB and PACMS Partnership

MSAMB and the Primary Agricultural Cooperative Marketing Societies (PACMS) in partnership are working together to achieve following objectives.

- 1) To promote necessary latest scientific production technologies to the farmers. Inputs, such as seed or root stocks of improved varieties, cultivation practices including soil health, modern irrigation system, proper pruning, training etc. are providing by PACMS.
- 2) To create infrastructural facilities so as to adopt a scientific post-harvest management technology which includes grading, sorting, packaging, cold storage, pre-cooling and refrigerated transportation.
- 3) To facilitate institutional credit and working capital for export of produce.

- 4) To arrange training programs for farmers on latest production technologies and post-harvest management practices which would help in adoption of quality control measures right from planting to export.
- 5) To set up demo processing projects.

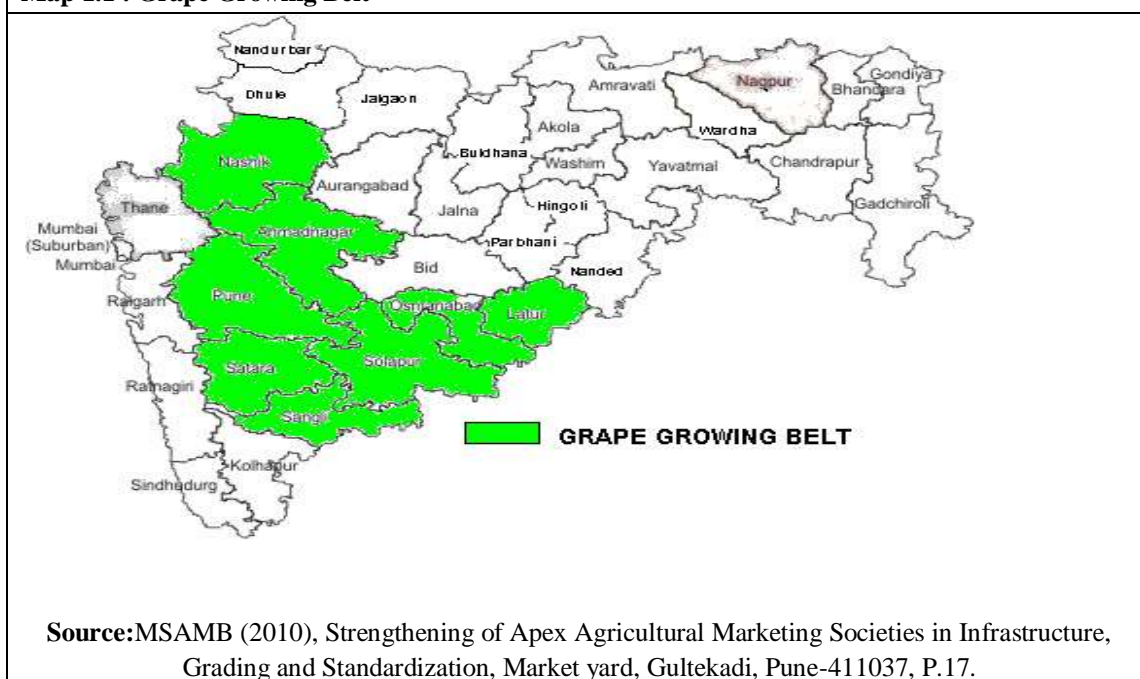

Detail information of partnership organization of MAHAGRAPES is as follows –

## 1.6 MAHAGRAPES

### 1.6.1 Scenario of Grapes

India is second major grape producer in the World and stands highest in the productivity. Maharashtra is the first in grapes and Seedless. Its storage conditions are namely temperature 0°C to 2°C, relative humidity 85 per cent to 90 per cent, Storage period 3-8 weeks. Its growing belt are Nashik, Sangli, Solapur, Pune, Osmanabad, Latur, Ahmednagar and Satara.

**Map 1.1 : Grape Growing Belt**

The country's export of grapes is around 55000 MT per annum and 85 per cent export from Maharashtra. Export of grapes is being done to U.K., European countries, Middle East, South East Asian Countries. (See Table 1.1)

**1.6.2 About MAHAGRAPES:** In order to boost the export of grapes of Maharashtra, "MAHAGRAPES", a cooperative partnership apex society was established on 19<sup>th</sup> January, 1991, with the help of MSAMB, Pune. Grape Grower Co-operative Societies from Sangli, Solapur, Latur, Pune and Nashik are the member societies of MAHAGRAPES. Main objective of MAHAGRAPES is to boost the export of grapes and for the same, facilities like pre-cooling and cold-storages has been erected at each grape grower cooperative society. Efforts of MAHAGRAPES in the grape export have helped to establish brand of Maharashtra's Grapes in the international market. (See Table 1.1)

### 1.6.3 Objectives of MAHAGRAPES

MAHAGRAPES have committed to the following objectives:

- 1) Up-liftmen of farmer's community.

- 2) Encourage and develop agricultural export, particularly of fresh fruits.
- 3) Maximize foreign exchange earnings.
- 4) Update the farmers on latest technology in farming.
- 5) Growth of co-operative movement.

MAHAGRAPES is one of the largest exporters of fresh grapes, mainly seedless grapes from India. In keeping with the international trend of grape growers, the vineyard owners of Maharashtra have entered in international markets with their own brand MAHAGRAPES.

**1.6.4 Organization Structure of MAHAGRAPES:** The board of directors of MAHAGRAPES comprises of 7 members nominated by heads of the respective co-operative societies. The board of directors also nominates two prominent and expert farmers as ‘executive partners’ amongst themselves to manage the day to day affairs. The executive partners are responsible for the decision-making and execution in the organization. The executive partners are assisted by a team of Professional Managers, which constitutes General Manager (Exports), Manager (Liaison & Logistics), Manager (Finance), Manager (Quality Control) assisted by a team of Quality Control Officers. This team of professionals performs the delicate balancing act of internationally acceptable “Quality Product” and identifying the lucrative markets to increase net returns to its growers.

**1.6.5 Member Societies:** Grape growers of Sangli, Solapur, Pune, Nashik, Ahmednagar, Osmanabad and Latur districts have formed 16 cooperative societies with a membership of almost 2500 farmers. Reaching to an individual farmer was a difficult task to which formation of cooperative societies has provided the answer. List of partnership cooperative societies federated as MAHAGRAPES is as follows. (See Table 5.3) Each co-operative society is equipped with a pre-cooling and cold storage facility; the technology imported from California which has proved to be an essential export tool.

No.	Name of the Society and District
1	Baglan Taluka Grape Growers Co-op. Society LTD., Nashik.
2	Chaitanya Grape Growers Co-op. Society LTD., Sangli.
3	Dhule Taluka BagayatdarSahakariSangh MYDT, Dhule.
4	Karmaveer Grape Growers Co-op. Society LTD., Dhule.
5	Kamdhenu Grape Growers Co-op. Society LTD., Sangli.
6	Kanak Grape Growers Co-op. Society LTD., Solapur.
7	KhandaobaPananShakariSanstha MYDT., Osmanabad.
8	LaturZillaDrakshUtpadakShetkariSangh, Latur.
9	Mogi Grape Growers Co-op. Society LTD., Nashik.
10	Malta Grape Growers Co-op. Society, Nashik.
11	Poona Grape Growers Co-op. Society LTD.,Pune.
12	Shri Siddeshwar Grape Growers Co-op. Society LTD., Sangli.
13	Shriram Grape Growers Co-op.Society, Nashik.
14	Solapur Grape Growers Co-op. Society LTD., Nashik.
15	Saibaba Grape Growers Co-op. Society LTD., Ahmednagar.
16	Vithal Grape Growers LTD., Solapur.

### 1.6.6 Export Activities

#### a. EUREPGAP or GLOBALGAP Certification

MAHAGRAPES now has a big list of grape growers 36 representing different regions, who have obtained EUREPGAP certificate for their farms and more farmers would be added to the

list. Individual fee is Rs.20000 & if group is considered individual constituent of a group has to pay around Rs.6000 to be renewed every three years.

In addition to this, these farmers have started process of obtaining TESCO's "Nature's Choice Certification" too. For selling produce in supermarket of U.K. fees for certification is around Rs.25000 to be renewed every 3 years. Two partnership societies, namely Shri Siddeshwar Grape Growers, Savlaj, Dist. Sangli and Poona Grape Growers, Bhandgaon, Dist. Pune, have been awarded ISO: 22000. This is the latest World Food Safety Certification, awarded for the first time in India.

- b. Quality Control:** Quality occupies prime importance at MAHAGRAPES. A team of quality control officers monitor fruit quality at different stages of operation, beginning from cultivation in the farm to packing the fruit for export. Fruits not meeting quality specifications are rejected at source.
- c. Export:** Apart from grapes, MAHAGRAPES have also exported pomegranate. They have exported pomegranates to European countries. Mainly 3 varieties of seedless grapes are grown for exports viz. Thompson Seedless, Tas-a-ganesh and Sonaka seedless (bud-sport of Thompson seedless having elongated berries) and two varieties of Pomegranates mainly viz. Bhagwa and Ganesh. Details of the actual export are as follows –

<b>Table 1.4 : Details Export of Grapes and Pomegranates</b>				
<b>Year</b>	<b>Grapes Qty in M.Ton</b>	<b>Value in Lac Rs.</b>	<b>Pomegranates Qty. in M. Ton</b>	<b>Value in (00,000) Rs.</b>
2001 – 02	852.48	454.69	54.60	33.16
2002 – 03	750.41	404.19	189.56	108.72
2003 – 04	546.989	356.90	208.060	117.20
2004 – 05	824.891	487.57	52.37	20.61
2005 – 06	1337.649	799.48	Nil	Nil
2006 – 07	1904.561	1176.17	Nil	Nil
2007 – 08	Nil	Nil	Nil	Nil
2008 – 09	Nil	Nil	Nil	Nil
2009 – 10	Nil	Nil	Nil	Nil
2010 – 11	Nil	Nil	Nil	Nil
2011 – 12	Nil	Nil	Nil	Nil
2002 – 13	Nil	Nil	Nil	Nil
<b>Total</b>	<b>6216.98</b>	<b>3679.00</b>	<b>504.59</b>	<b>279.69</b>
<b>SGR</b>	<b>123.41</b>	<b>158.68</b>	<b>-4.08</b>	<b>-37.85</b>
<b>Source:</b> MSAMB (2010), Strengthening of Apex Agricultural Marketing Societies in Infrastructure, Grading and Standardization, Marketyard, Gultekadi, Pune-411037, p.19.				
<b>Note:</b> SGR=Simple Growth Rate.				

During a short span since its activity began, MAHAGRAPES has established itself as a major organization exporting quality grapes from India. MAHAGRAPES has succeeded in establishing its brand name in the highly competitive and quality conscious international markets, major volume of the fruit being sold through the super-market chains in the United Kingdom and Europe. Persevering grape growers, strict quality control, use of packaging of international standards, proper maintenance of cold chain in the export process and maintaining cordial relations with clients or buyers the world over have all added up towards the success of MAHAGRAPES. Grapes total export is 6217 Mts from year 2001-02 to 2009-10. Its growth rate is 123.41 per cent. Grapes total value is Rs.3679 lakh from year 2001-02 to 2009-10. Its value growth rate is 158.68 per cent. Pomegranate total export is 504.59 Mts from year

2001-02 to 2009-10. Its negative growth rate is -4.08 per cent. Its total value is Rs.279.69 lakh from year 2001-02 to 2009-10. Its negative values growth rate is -37.85 per cent. Pomegranate negative growth rate are of production and value because of rainfall is not falling sufficient.

#### d. Awards

MAHAGRAPES success is showing in itself got it five awards from APEDA and Pune chamber in the different years from 1998 to 2000. (See Table 1.5)

Table 1.5 : Success of MAHAGRAPES		
Sr. No.	Awards	Year
1	Institute of marketing and management (Pune Chapter) award for excellent contribution towards agro-exports in the co-operative sector.	1998-97
2	The Apeda Export Award for outstanding contribution to promotion of Agricultural and processed Food Products.	1996-97
3	The Apeda Export Award for Export promotion of fresh fruits	1997-98
4	The certificate of Merit is awarded by Apeda for export promotion of grapes.	1998-99
5	The Apeda certificate of Merit for contribution to promotion of Agricultural and Processed Food Products for Quality and Packaging Development.	1999-2000
<b>Source:</b> MSAMB (2010), Strengthening of Apex Agricultural Marketing Societies in Infrastructure, Grading and Standardization, Marketyard, Gultekadi, Pune-411037, p.22.		

**1.6.7 Existing Infrastructure:** MAHAGRAPES have 16 partnership co-operation societies and each cooperative society is equipped with a pre-cooling and cold storage facility. The technology imported from California (year 90-91) which has proved to be an essential export tool. However, 5 pack house units out of 16 are not in operations now a days. The major reasons for these sick pack houses are that MAHAGRAPES is realizing the importance of quality in export markets, so MAHAGRAPES is focusing on the quality of grapes exported. Consequently, its export volume had reduced considerably, at the same time, the major market of European Union is also been setting stringent standards on pesticide residues as per the SPS agreements of the WTO. Now, the Eurep Gap certification has become mandatory, pack houses are also need to be ISO - 22000 certified therefore, small and medium farmer find it more difficult to trade in the global market. All these reasons have constrained the societies to close their pack houses. Therefore there is need of strengthening the system of overall pack house operations of all the partnership societies. There is again need to strengthen the marketing infrastructure in the scenario of emerging supermarkets and hypermarkets.

#### 1.6.8 Proposed Infrastructure Facilities

##### a. Establishment of the Weather Stations

Weather forecast system would facilitate several benefits to 10,000 farmers; early weather forecast system will alert the farmers about weather related risk of diseases, which will lead to scientific vineyard management i.e. spraying, plant protection measures, early harvest etc. Weather stations will be established at the premises of each grape grower's society (Total 16 numbers).

**b. Global Gap or TESCO Certification:** The Eurep Gap or Global Gap Certification has become mandatory for export of any agricultural produce in all the countries. MAHAGRAPES has planned to

get Global Gap Certification for their 350 members and TESCO certification for at least 150 member farmers.

**c. Setting up of Retail Stores or Shops at Pune and Mumbai (20 numbers each):** MAHAGRAPES is going to hire retail stores and start up activities of selling of fresh produce at minimum 20 retail stores each in Pune and Mumbai. The other horticultural produce can also be marketed through these retail shops. These retail stores are furnished with cooling and a refrigeration facility, and 4Reefer Vans are connect the farms with these retail stores in Pune and Mumbai.

**1.7 Conclusion:** Horti-business is increasing in India. Government is intervention to help to the farmer's graphs production to export promotional. These intervention are Salient Features of Indian Horti-business, International Market Trends, scenario of export of major fresh fruits from the country, role of Central Government and Agricultural Marketing, steps followed to improve international market share, role of Maharashtra and Horticultural Development, Agribusiness Opportunities in Maharashtra, functions of MSAMB and MAHAGRAPES, important programmes, projects and schemes that implemented by MSAMB and MAHAGRAPES.

## **OCCUPATIONAL HEALTH AND SAFETY AT MANUFACTURING INDUSTRIES AT KATHMANDU VALLEY**

**Ankit Devkota**

*Tribhuvan University, Katmandu, Nepal*

**Introduction:** Occupational health and safety is the science of anticipation, recognition, evaluation and control of hazards arising in or from the workplace which could impair the health and well-being of workers, also impacts the surrounding communities and the environment. Though the International Labor Organization (ILO) has maintained and developed a system of international labor standards since 1919 which aimed at promoting opportunities for decent and productive work, in conditions of freedom, equity, security and dignity. It is relatively new and very few industries maintain occupational standards. OSH is a cross-disciplinary area concerned with the safety, health and welfare of the people at their workplace. Although various institutions and individuals have defined occupational safety and health differently but all of them agreed on the same meaning is that protecting and promoting the health and well-being of the workers as well as protecting the general environment through preventive actions in the workplace (Pun, 2011). Industrial sector has more risk of occupational hazards than other sectors. Industrial occupation may create unsafe work and work environment because of the inherent sources of hazards inherent in material, process, technologies or products. These sources of hazard may pose risk of occurring diseases and happening accidents to the employees within the industrial premises and the general public in the vicinity as well as to the general environment. Safe and hazard free work and work place are needed for higher productivity, efficiency, quality of any industrial process. Among the workplaces high risk for safety and health may occurred in the workplace: working with machine and equipments, use of electricity, construction works, transportation, use of chemicals, dusty worksites, congested and dark workplace (Upadhyay, 2005). Establishing a safe and sound work place environment in any establishment based on the ergonomic principle is the important aspect to increase the productivity. Sound health and healthy working conditions are the prerequisites to promote development of society at all levels through increasing workers' overall quality of life (Joshi, & Dahal, 2009). Edwin Chadwick (1842) a British lawyer and sanitarian, described the deplorable conditions of factory workers in his "Report into the Sanitary Conditions of the Laboring Population of Great Britain." He reported that life expectancy was much lower in towns than in the countryside and attributed his findings to air pollution. occupational safety and health is concerned with preserving and protecting human and facility resources in the workplace. Practitioners in the field try to prevent needless deaths and injuries to workers. It involves more than first aid activities and is far-reaching in both scope and practice. Occupational safety and health involves helping people by preventing them from being injured or becoming ill due to hazards in their workplaces. Massachusetts(1877) passed a law requiring safeguards on hazardous machinery that tied liability to actions of employers. Exposure to toxic metals such as mercury and lead has been an occupational health problem for hundreds of years. Technological advances introduced new and unique hazards, typically overlooked by untrained observers, which were recognized only after numerous cases were reported. Dramatic changes in technology and workplace design, along with other technological advancements, have not necessarily resulted in healthier or safer workplaces. Workers today may be exposed to as were their ancestors in years past. Factory machinery with unguarded gears mangling fingers and hands has been replaced by electronic office equipment causing wrist and arm injuries. Workers still face chemical and toxic hazards, as evidenced by industrial

disasters such as those at Three Mile Island and Union Carbide Institute in West Virginia. The complexity of current safety and health conditions mirrors the complexities associated with modern workplace technology. Practitioners in this profession must develop the broad range of knowledge and skills necessary to ensure the protection of people and company resources. This knowledge base must include a well-grounded understanding of the terms and concepts used in the profession. In addition, occupational safety and health professionals must possess the skills required to effectively perform their roles and responsibilities in the safety, health, and environmental areas. (Kohn, Timmons, and Besesi, 1991) examining the roles and responsibilities of safety professionals identified the following activities as those most frequently performed, Accident Investigation: determining the facts and causes related to an accident based on witness interviews and site inspections. Work with Emergency Response Teams: organizing, training, and coordinating skilled employees to react to emergencies such as fires, accidents, or other disasters. OSH is one of the major issues directly related to the workers' rights. Almost all of the Nepali labour force involves in informal sector and they are still unaware of the concept and importance of OSH. As a result of continuous struggle of Nepali workers and trade unions as well as solidarity from international centres of trade unions and supportive organizations this issue is gradually coming in the limelight among Nepali working masses (Rimal et al., 2003). Occupational safety is considered significant in mechanized industries while its importance in other sector is equally important. The scenario has been continuously changing since the last few years and gradually accepted as a business tools. In spite of that, there is a lot to improve. Presently, it is estimated that 11,779 thousand Nepali aged 15 year and more are engaged in one or the other occupation in Nepal. Among them 74 percent are engaged in agriculture and forestry sector where rest 26 percent are in non-agriculture sector (CBS, 2009). It is estimated that each year approximately 20,000 workers suffers from accidents at workplace which lead to about 200 lives lost in Nepal (Pun, 2011).

1. **Methodological aspects:** The study is based on the primary data which were gathered from 102 respondents of 10 manufacturing industry at Kathmandu valley. The respondent's views were collected on climate change, physical condition, behavior and management strategy.

Table 1 shows the list of sample manufacturing industries in along with the number of respondents selected for the study.

**Table1: Number of manufacturing industries selected for the study along with number of observations**

S.N.	Name of the Manufacturing industries	Number of observations
1	Krishna pauroti	20
2	Bhaktapur pasmina udyog	15
3	Shiwakoti bag industries	16
4	Himal farm	8

<b>Total observations</b>		<b>102</b>

Thus, the study is based on 102 observations.

**The model:** This study has carried out several regression models, correlation analysis, mean and standard deviation to identify the relationship between occupational health and safety and its

relationship with different independent variables. This section deals with statically and econometric model used for the purpose of analysis of secondary data. The methods of data analysis used in this study are divided into two sections. First section deals with the methods of secondary data analysis. This includes descriptive and correlation analysis. Second section deals with the different test of the significance for validation of model such as F-test, P-test and regression analysis. All models are tested for individual effects by running F-test statistical package for social science (SPSS 16). Details of models and statistical test of significance have been dealt in the following sections. Here occupational health safety is the dependent variable and climate change, physical condition, management strategy, behavior is the independent variable. The model used in this study takes the following form:

$$\text{OHS} = \beta_0 + \beta_1 \text{CC} + \beta_2 \text{PC} + \beta_3 \text{B} + \beta_4 \text{MS} + E_0$$

CC= Climate change

PC= Physical condition

B= Behavior

MS= Management strategy

$\beta_0$  = Intercept of the dependent variable

e= error term

$\beta_1, \beta_2, \beta_3, \beta_4,$  and  $\beta_5$  are the beta coefficients of the explanatory variables to be estimated.

1. **Climate change:** There has been considerable research and planning with regard to the public health and environmental aspects of climate change, but little on its effects on workers. Workers are often the first to be exposed to the effects of climate change and may be affected for longer durations and at greater intensities. [Roelofs and Wegman 2014]. The impact of climate change on workers can include numerous hazards: Direct effects, such as increased ambient temperatures, air pollution, ultraviolet (UV) radiation, extreme weather, vector-borne diseases, and expanded vector ranges Indirect effects, such as hazards from new and emerging industries such as renewable energy, carbon sequestration, and “green industries”, and changes in how structures and communities are built and maintained

*H1: There is the positive relationship between climate change and occupational health and safety.*

2. **Physical condition:** It provides the justification of physical unsafe activity for health by critically reviewing the recent US Surgeon General's Report. Evidence is summarized of the effects of physical activity on physiological responses, overall mortality, a number of diseases and disabilities, overall functional capacity, and mental health and quality of life.

*H2: There is the positive relationship between physical condition and occupational and safety.*

3. **Behavior:** According to Rosa Brook, the concept of workplace harassment is based on two premises. Firstly, regardless of gender, race, sexuality or any other defining characteristic; every person should be given the right to be "free from abusive treatment in the workplace". With freedom from abuse given as a basic human right, any form of discomfort or discrimination in workplace becomes labeled as an act of harassment. Secondly, the issues caused by workplace harassment affect the victims in harmful ways. Discrimination in the workplace hinders victims from successful advancement in their careers, limiting the capabilities of the victim.

*H3: There is the positive relationship between behavior and occupational and safety.*

#### 4. Management strategy

The European Agency for Safety and Health at Work (EU-OSHA) commissioned RAND Europe to conduct an empirical analysis of the findings collected in the European Survey of Enterprises on New and Emerging Risks (ESENER) managed by EU-OSHA on the factors associated with the effective management of occupational safety and health.

The following were the main findings of the empirical analysis:

- The most frequently reported components of the index are the implementation of an OSH policy, discussion of OSH in high-level management meetings, the involvement of line managers in OSH management and regularly carrying out risk assessment. The least frequent are the use of health and safety services (e.g. ergonomic support); the analysis of reasons for absence; whether health and safety information is used to inform or improve OSH management; and the existence of a health and safety representative.
- OSH management practice appears to follow the traditional perceptions of risks and technological innovation, with establishments in traditionally ‘high risk’ industries and those in technology-intensive industries reporting higher levels of OSH practice. However, particularly in light of emergent or growing problems, such as musculoskeletal disorders, stress, violence and harassment, the comparatively low levels of OSH management in certain (particularly service oriented) sectors needs to be addressed.

H4: *There is the positive relationship between management strategy and occupational and safety.*

**2. Results and discussion**

**Correlation analysis:** On analysis of data, correlation analysis has been undertaken first and for this purpose Kendall’s Tau correlation coefficients have been computed and the results are presented in Table 2.

**Table 2: Kendall’s Tau correlation matrix for the dependent and independent variables for selected Manufacturing industries at Kathmandu valley**

*This table shows Kendall’s Tau correlation coefficients between dependent and independent variables. Occupational health and safety is dependent variables. The independent variables are CC (climate change is defined refer to a change in average weather conditions, or in the time variation of weather within the context of longer-term average conditions.), PC (Physical condition is defined as the drives that recognizes the efforts and contributions of the organization members), B (behavior is define as the way in which one acts or conducts oneself, especially towards others which can have a direct impact on employees’ health) and MS (management strategy) involves the formulation and implementation of the major goals and initiatives taken by a company’s top management on behalf of owners, based on consideration of resources and an assessment of the internal and external environments in which the organization competes)*

Variables	Mean	Std. Deviation	CC	PC	B	MS	OHS
CC	2.038	0.634	1				
PC	2.088	0.603	.516**	1			
B	2.268	0.716	.326**	.358**	1		
MS	2.106	0.646	.530**	.450**	.338**	1	
OHS	2.149	0.688	.404**	.329**	.466**	.524**	1

Note: \*\* Correlation is significant at the 0.01 level (2-tailed)

The table shows that the average value of the climate change is 2.038. Likewise, the average value of physical condition is 2.088. Similarly, the average value of behavior, management strategy and occupational health and safety are 2.268, 2.106, and 2.149 respectively The results show that climate change is positively related with employee occupation health and safety. This means that change in the climate leads to affect the health of the employee. Similarly, physical condition is positively correlated to occupational health and safety. This indicates physical condition leads to affect the health of the

employee. Likewise, the results show that behavior is positively related to occupational health and safety. This indicates that proper behavior can lead to increase in positive health of the employees. Likewise, the results show that Management strategy is positively correlated to occupational health and safety. This means that better the management strategy on the basis of employee health better would be occupational health and safety.

**Regression analysis:** The estimated regression results show the relationship between the dependent variables i.e. occupational health and safety. Climate change, physical unsafe condition, unsafe behavior, and management strategy are independent variable. The estimated regression results is shown in Table 3

**Table 3: Estimated regression results of CC, PC, B and MS on occupation health and safety in Kathmandu valley**

The results are based on pooled cross-sectional data and effect on occupation health and safety with 102 observations of 2017 survey using linear regression model. the model is  $OHS = \beta_0 + \beta_1 CC + \beta_2 PC + \beta_3 B + \beta_4 MS + et$ , where, dependent variable is OHS (Occupational Health And Safety) and CC (Climate Change), PC (Physical Condition), B ( Behavior) and MS (Management Strategy) are the independent variables

Model	Intercept	CC	PC	B	MS	R2	SEE	F-value
1	1.257 (5.849)*	0.438 (4.344)*				0.154	0.633	18.873
2	1.365 (5.748)*		0.375 (3.433)*			0.99	0.653	11.784
3	0.135 (5.533)*			0.447 (5.184)		0.209	0.612	26.874
4	0.974 (4.803)				0.558 (6.058)*	0.276	0.589	36.697
5	0.184 (0.737)	0.224 (1.171)	0.106 (0.891)	0.245 (2.525)**	0.369 (3.002)*	0.395	0.558	17.489
6	0.249 (1.045)	0.278 (2.403)**		0.270 (2.909)*	0.369 (2.975)*	0.396	0.557	23.102
7	0.421 (1.804)			0.290 (3.065)*	0.530 (4.961)*	0.367	0.571	30.306

Notes

- I. The asterisk sign (\*) and (\*\*) indicates that results are significant at the 1% and 5% level respectively
- II. Figures in parentheses are t-values
- III. Occupational health and safety is the dependent variable

Table 3 shows that beta coefficient is positive and significant for climate change. It indicates that constant the changing climate, better would be occupational health and safety. Similarly, the beta coefficient is positive and significant for physical condition. This means that negative the physical condition towards employee, occupation health and safety of employee would be better. Likewise, the results show that beta coefficient is significant and positive for behavior. This means that good behavior with employee leads to improvement in the emotional and psychological health of the employee. Similarly, the beta coefficient is positive and significant for management strategy. This means that good and strong the management strategy in flavor with the employee health and safety it will improve health and safety condition of employee working in an organization.

**4. Summary and conclusion:** This study has mainly focused on occupational health and safety at Kathmandu valley. This study has used factors like; climate change, physical condition, behavior,

management strategy. The dependent variable is occupational health and safety. The result documented in this study is based on the 102 selected observations. The results show that there is positive relationship between occupational health and safety and physical condition, which indicates that better the physical condition better will be the employee health. Results indicates that the positive relationship between behavior and employee health and safety condition. Similarly, the positive relationship between management strategy and occupational health and safety. Thus, result reveals that proper management strategy which is made by focusing the health and safety of employee will impact occupation health and safety in a positive manner. After making the entire analysis of the data, the first hypothesis (H1) that deals with positive relationship between climate change and occupation health and safety i.e. more constant the climate condition it will be easy for employee to work as there body adopt to the environment change in climate condition frequently will affect the health of the employee. The second hypothesis H(2) has been accepted as physical condition has positive impact on the occupation health and safety, better the physical condition provided by organization to its employee better will be the chances for safety of an employee. Similarly, hypothesizes third (H3) is also accepted because if employee are shown a good behavior by their superior they will work with their interest and free from stress it will have good effect on employee mental and psychological health of an employee. The fourth hypothesis (H4) is also accepted because management strategy has positive effect on the occupation health and safety. If the management strategy is made by focusing on the health and safety condition of an employee it will bring positive effect on the health and safety condition of the employee working in an organization

## DEMONETIZATION AND ITS IMPACTS ON INDIAN ECONOMY

**Jawale S. R.**

*Associate Professor, S.S.G.M. College, Kopargaon*

**Introduction:** Demonetization is the act of stripping a currency unit of its status as legal tender. The current form or forms of money is pulled from circulation and retired, often to be replaced with new notes or coins. Demonetization affects the economy through the liquidity side. High value currency notes of denomination of 1000 and 500. Such notes, valued at 15.4 trillion, constituted 86.9 percent of the value of total currency in circulation. The government's main objective of demonization is, to eradicate counterfeit currency, resist tax evasion, destroy the black money and terrorist financing activities and to encourage the country towards the cashless economy. This decision was taken by government is for welfare of nation. In the days following the demonetization, the country faced severe cash shortages with severe detrimental effects across the economy.

**Objectives of the Study:** The major objectives of the study are:

1. To know about actual present outcomes of demonetization.
2. To analyze the impacts of demonetization.
3. To analyze the Positive and negative impact of demonetization on Indian economy.

**Research methodology:** The research Paper is purely based on secondary data. Secondary data is collected from library, text books and journals, articles from news papers and from relevant websites available on internet.

### **Impact of Demonetization:**

**Positive Impact:** Demonetization as a cleaning exercise may produce several good things in the economy. One of the positive impact of this move is that it is going to drastically affect the corrupt practices.

**Stop Black Money flow:** Demonetization will help the government to track the black-money and the unaccounted cash will now flow no more and the amount collected by means of tax can be better utilized for the public welfare and development schemes.

**Increased Income Tax Revenue:** Lower tax rates as the tax base widens and more people start paying taxes. The digital push of the government will also result in higher indirect tax revenue for the government in the form of service tax. Moreover businesses that under reported their revenue earlier will have to make proper disclosure, especially, of revenue received through digital or cashless means.

**Blocking inflow of fake currency:** In India, the circulation of fake Indian currency notes has been on rise according to Reserve Bank of India. The year 2014-15 saw a steep rise with 594, 446 FICN detected Rs. 500 notes were most common, with 273, 923 recovered Rs. 100 and Rs. 1000 notes were the second and third most counterfeited bills. Most of the FICN printed in Pakistan, Nepal & Bangladesh. Now all this FICN is equal to zero.

**Control on terrorism:** One of the biggest achievements of demonetization has been seen in a drastic curb of terrorist activities as it has stopped the funding the terrorism which used to get a boost to inflow of unaccounted cash and fake currency in large volume. Terror related activities in J & K witnessed a noticeable halt in the days following the demonetization drive. The availability of cash has surely declined among the terror groups presently.

**Increase in digital payments:** Demonetization has driven the country towards a cashless society. Lakhs of the people even in remote rural areas have started resorting to use the cashless transactions. The move has promoted banking activities. Businesses in the fin - tech sector, including payment banks, mobile wallets, electronic transfer providers, etc are expected to see gains. Pos machines and use of card based payments are very popular.

**Lowered interest rate and inflation:** Loan interest will fall as banks will have more money to invest due to increase in deposits. This will lead to increase investments by foreign companies will lead to price control of essential commodity and thereby inflation will reduce.

**Banking System will Improve:** A good economy is always said to be an economy with a sound banking system. Banking system in India will get a boost, as around 7-8 lakh crores base money (new legal money) will the system, which will further create around 3-4 times more money due to re-circulation. RBI data showed that gross financial savings rose to 11.8 percent of gross national disposable income in fiscal year 2017, a jump of 90 basis points from 10.9 percent in the previous year 2015 – 16 and 10.1 percent in 2014 – 15. Bank deposits rose by 16.2 percent as compared to 13.1 percent in the corresponding period of previous year, reflecting a surge in deposits in the banking system.

The public sector Banks which were reliving under deposit crunch and were running short of funds have suddenly swelled with lot of money which can be used for future finances and loans.

**Negative Impact:**

**Loss Growth momentum:** India's GDP which grew at 7.6 percent in financial year 2015-16 is likely to slow down by 0.5 percent to 1.5 percent as per reports of various agencies. The GDP growth rate for the quarter April-June 2017 dropped to 5.7 percent in comparison to 7.9 percent for the same quarter in previous year. This was the lowest growth in GDP since 2014. India's GDP in 2016 is estimated to be US\$ 2.25 trillion, hence one percent reduction in growth rate represents a short fall of 22.5 billion( Rs. 1.54 lakh crore) for Indian economy.

**Adverse impact on Loan Disbursement:** Banks have also been focusing on the single task of deposit and withdrawals with result that their core function of issuing loans has been adversely affected. Also current account customers, who are largely business owners, need large amount of cash at short notice have not been able to access cash and credit owing to restrictions on withdrawals and in ability of banks to focus on the task of loans.

**Agriculture sector:** India is an agriculture based economy. Due to cash crunch, the farmers especially small and marginal who largely depend on cash to buy seeds, fertilizers and to pay for sowing, borrowing water for irrigation and for other related agriculture equipments remained worst affected and could not complete the crop related activity. Since small branches of the banks were also not supplied with adequate cash with in time of sowing season of the crop. Farmers did not get their crop loans disbursed. This added to the woes of the farmers leading to a weak agriculture production the coming year.

**Prices of Food products falls:** Farmers are having problems in selling their produce as both the parties have to agree on the mode of payment. There is acute shortage of Rs. 500 Demonization notes presently, change for the high denomination Rs. 2000 notes is not readily available with the vegetable and Fruit vendors. This is also taking the buyers away from these vendors to big retail markets thus impacting the livelihood of the unorganized sector.

**The small and medium sized enterprise sector :** The labour wages in small and medium sized enterprise sector are largely paid in cash and wages have been adversely affected. Unemployment has been decline in demand of SME goods as the purchasing power of the consumer has contracted in the short term. Other sectors within the SME space like restaurants and transport operators have also been negatively impacted. After the demonetization was announced. about 800,000 truck drivers were affected with scarcity of cash, with around 400,000 trucks stand at major highways across India.

**Drop in Industrial Production:** Since consumer demand has slowed and consequently industrial production has declined, employment generation has been adversely impacted by the currency demonetization drive. The growth in eight core sectors such as cement, steel and refinery products, which constitute 38 per cent of the index of industrial production was only to 4.9 percent in November as compared with 6.6 percent in October.

**Service Sector:** Service sector is hit very hard by demonetization decision in November 2016 worst slump in nearly three year is noted. The Nikkei India services purchasing managers' Index (PMI) which tracks services sector companies on a monthly basis, stood at 46.7 in November, down from 54.5 in October. The index slipped into contraction territory for the first time since June 2015 and pointed to the sharpest reduction in output for almost three years.

**Job Losses:** Employment of skilled and semi-skilled laborers is witnessing slowdown in production; not only less jobs are being created but lay-offs are also taking place at higher rate. Industry is staring at temporary job losses due to demonetization, as production gets hit, especially in labour intensive sectors like textiles, garments, leather and jewellery. As many of 4 lakh people, mostly daily wagers may have either lost their jobs or shunned work temporarily due to lack of payment. Due to the inability to pay cash to poor daily wage workers, the small employers have stopped their business activity.

**Real Estate Sector:** The real estate sector is likely to see a significant negative impact in the medium - to long term, particularly in the repurchase market. There are expectations of a revaluation of current real estate transactions across the board representing possible losses to players in the sector.

**Added replacement cost of currency:** The move will give birth to an extra added cost which can be said as the replacement cost here. As whole currency in circulation needs to be replaced so there will be new currency which needs to be printed and this will lead to a huge printing cost. The RBI annual report confirms that the costs of printing currency notes more than double to Rs. 7,965 crore in 2016 – 17 from Rs. 3,421 in the previous year on account of new currency printing 133 percent jump in cost of printing currency notes between July 2016 to June 2017.

In total removing the old notes and replacing them with the new Rs. 500 and Rs. 2000 notes will cost the Central Bank of total at least 12000 crore.

**RBI dividend decline:** Demonetization was one of the main reasons for Reserve Bank of India's lower than – usual profits. The dividend paid by Reserve Bank to the government for financial year 2016-17 was Rs. 30.7 lakh crore, as against the expectation of Rs. 74.9 lakh crore. This was less than half the dividend of Rs. 65.9 lakh crore paid by the RBI in 2015-16.

**Fails to Curb Black Money:** Central Bank report released in August 2017 stated that 99 per cent of the Rs.500 and Rs. 1000 notes that were demonetized return to the banking system. Further of it Rs 16000 crore that is still out most of its accounted for. In brief, not even 0.01 percent of black money has been extinguished. Therefore the government failed in its aim of purging black money from the economy.

**Conclusion:** Demonetization of currency notes of Rs. 500 and Rs. 1000 Surely had some positive impact like reducing the cash flow to terror organizations, dismantling of counterfeit currency infra structure, better income tax and indirect taxation, boost to digital economy. However, it has come at a huge social and economic cost. the demonization costs are estimated 17,000 crore towards the government and the RBI for implementing the demonetization process in India. Only demonetization is not sufficient to counter black money and corruption in the country. Demonetization has create so many hurdles of the citizen of India. Citizens of India faced so many problems due to demonetization drive. Citizens of India faced problems of less consumption of goods due to lack of liquidity. Several businesses disrupted due to lack of liquidity, business owners as well as consumers faced so many problems. Demonetization as a cleaning exercise may produce several good things in the economy. At the same time, it creates unavoidable income and welfare losses to the poor sections of the society who gets income based on their daily work and those who doesn't have the digital transaction culture. Overall economic activities will be dampened in the short term. But the un measurable benefits of having more transparency and reduced volume of black money activities can be pointed as long term benefits.

## **THE VIEWS OF AMARTYA SEN AND NUSSBAUM'S ABOUT HUMAN DEVELOPMENT / CAPABILITY APPROACH**

**Dr. Tukaram Munde**

*Professor & HOD, Department of Economics, K.K.M. College, Manwath, tvmunde@gmail.com*

### **Human Development:**

Human development is the expansion of people's freedoms to live long, healthy and creative. The concept of human development emerged in the 1980 based on the conceptual foundation provided by Dr. Amartya Sen and Dr. Mahbub ul Haq. The Human Development approach puts people at the center of the development agenda where economic growth and wealth are considered means to development not an end by itself. Put simply the starting point for the human development approach is the idea that the purpose of development is to improve human lives by not only enhancing income but also expanding the range of things that a person can be and can do such as be healthy and well-nourished be knowledgeable and to participate in community life. Seen from this viewpoint development is about removing the obstacles to what a person can do in life, obstacles such as lack of income, illiteracy, ill health, lack of access to resources, or lack of civil and political freedoms. As expressed by Sen: the twin recognition that human beings can fare far better & do much more to bring this about may sensibly be seen as the two central thesis of the human development approach.

The first Human Development Report defines human development as a process of enlarging people's choices. To lead a long and healthy life, to be educated and to enjoy a decent standard of living are the three most critical choices identified in the first HDR. Additional choices include political freedom, guaranteed human rights and self-respect. The philosophical underpinnings of the HD approach are not new. In ancient Greece, Aristotle said: Wealth is evidently not the good we are seeking for it is merely useful for the sake of something else. However during the Post Second World War era the development agenda however centered on growth rather than human wellbeing. The focus was on accumulation of physical capital through savings and investments for promoting industrial development and growth in the war torn economies. By the late 60 and early 70 a general shift in the development debate started to take place, where more emphasis was put on social development rather than capital accumulation and growth. The basic needs approach was introduced putting the basic needs of people such as access to basic education, basic health care, food, nutrition, water and sanitation on the agenda. Fulfillment of these basic needs was seen as a prerequisite for development. During the 1980's the global development agenda largely focused on expanding growth through various liberalization measures. The general perception was that liberalization would generate economic growth through the power of market forces, which in turn would benefit the poorer sections of society through the trickle-down effect. Structural Adjustment Programmes were carried out in order to streamline and adjust developing economies into the liberalisation agenda but the approach to a large extent failed to tackle the issue of poverty and inequalities.

Human development was formally defined in the first Human Development Report as a process of enlarging people's choices. The most critical of these wide-ranging choices are to live a long and healthy life, to be educated and to have access to sources needed for a decent standard of living. Additional choices include political freedom, guaranteed human rights and personal self-respect. Later reports and in work outside the UN, the concept has been refined and elaborated. For example, human development as a paradigm now emphasizes broadening choices and strengthening capabilities, based on conceptual and analytical work by Nobel laureate Amartya Sen and Martha Nussbaum among many others. In explaining capabilities, Sen has stressed the contrast between the great things that human beings can achieve and the limited lives most women and men end up having.

Amartya Sen, Human development as an approach is concerned with what I take to be the basic development idea: namely advancing the richness of human life rather than the richness of the economy in which human beings live which is only a part of it. Mahbub ul Haq, The basic purpose of

development is to enlarge people's choices. In principle, these choices can be infinite and can change over time. People often value achievements that do not show up at all or not immediately in income or growth figures: greater access to knowledge, better nutrition and health services, more secure livelihoods, security against crime and physical violence, satisfying leisure hours, political and cultural freedoms and sense of participation in community activities. The objective of development is to create an enabling environment for people to enjoy long, healthy and creative lives. Helen Clark, Perhaps most important, the human development approach has profoundly affected an entire generation of policy-makers and development specialists around the world including thousands within UNDP itself and elsewhere in the UN system.

Human development is the expansion of people's freedoms to live long, healthy and creative lives; to advance other goals they have reason to value and to engage actively in shaping development equitably and sustainably on a shared planet. People are both the beneficiaries and drivers of human development as individuals and in groups. Human development is about the real freedom ordinary people have to decide who to be, what to do and how to live. Enlarging human choices is critically linked to two issues: capabilities and functionings on the one hand and opportunities on the other. The capability of a person stands for the different combinations of functionings the person can achieve; it reflects the freedom to achieve functionings. Enlarging choices for a person implies formation or enhancement of capabilities. Human capabilities can be enhanced through the development of human resources: good health and nutrition, education and skill training, etc. However, capabilities cannot be used unless opportunities exist to use them for leisure, productive purposes or participation in social, political or cultural affairs. Economic opportunities can be created through better access to productive resources, including credit, employment, etc. Political opportunities need polity and other conditions. Human development thus represents an equation, the left-hand side of which reflects human capabilities, and the right-hand side, economic, political and social opportunities to use those capabilities.

**Sen's Approach:** The concept of a capability has a global-local character in that its definition abstracts from particular circumstances but its realization depends on specific local requirements. Sen points out that being relatively income poor in a wealthy society can entail *absolute poverty* in some important capabilities, because they may require more resources to achieve. The capability for employment may require more years of education in a richer society. Many capabilities will have underlying requirements that vary strongly with social circumstances. Strictly speaking the Capability Approach leaves open whether such 'expensive' capabilities, if considered important enough to be guaranteed by society as a matter of justice, should be met by making more resources available to those who need them. The Capability Approach only identifies such capability failures and diagnoses their causes. The capability approach takes a multi-dimensional approach to evaluation. Capability analysis rejects the presumption that unusual achievement in some dimensions compensates for shortfalls in others. From a justice perspective the capability approach's relevance here is to argue that if people are falling short on a particular capability that has been collectively agreed to be a significant one then justice would require addressing the shortfall itself if at all possible, rather than offering compensation in some other form, such as increased income. Capability evaluation is informational demanding and its precision is limited by the level of agreement about which functionings are valuable. However, Sen has shown that even where only elementary evaluation of quite basic capabilities is possible When evaluating well-being Sen argues the most important thing is to consider what people are actually able to be and do. The commodities or wealth people have or their mental reactions are an inappropriate focus because they provide only limited or indirect information about how well a life is going. Sen illustrates his point with the example of a standard bicycle. This has the characteristics of 'transportation' but whether it will actually provide transportation will depend on the characteristics of those who try to use it. It might be considered a generally useful tool for most people to extend their mobility but it obviously will not do that for a person without legs. Even if that person, by some quirk, finds the bicycle delightful, we should nevertheless be able to note within our evaluative system that she still lacks transportation. Nor does this mental reaction show that the same person would not appreciate transportation if it were really available to her. Amartya Sen had an extensive background in development economics, social choice theory and

philosophy before developing the Capability Approach during the 1980. Sen's most influential and comprehensive account of his Capability Approach, *Development as Freedom* helpfully synthesizes in an accessible way many of these particular, and often quite technical, contributions. Central to the human development approach is the concept of capabilities. Capabilities what people can do and what they can become-are the equipment one has to pursue a life of value. Basic capabilities valued by virtually everyone include: good health, access to knowledge, and a decent material standard of living. Other capabilities central to a fulfilling life could include the ability to participate in the decisions that affect one's life to have control over one's living environment, to enjoy freedom from violence, to have societal respect, and to relax and have fun. Capabilities are expanded by our own efforts and by the institutions and conditions of our society. People with extensive, well-developed capabilities have the tools they need to make their vision of a good life a reality. The capability approach is a normative framework used for analyzing well-being, often employed to understand development problems. The core premise of the capability approach is that well-being should be defined by people's real and actual opportunities to undertake the pursuits that they desire and through these freedoms, be whom they would like to be. An important part of Sen's argument for the Capability Approach relates to his critique of alternative philosophical and economics accounts. Economics has a branch explicitly concerned with ethical analysis.

**Sen and Nussbaum:** Nussbaum and Sen collaborated in the late 1980 and early 1990 and since they are the most high-profile writers in the Capability Approach their accounts are often elided, despite significant differences. When they are distinguished Nussbaum's account is often seen as the more 'philosophical' because she has developed the Capability Approach in a more orthodox philosophical way for example by focusing on theoretical rigor, coherence and completeness. As a result, Sen's approach is sometimes perceived merely as a predecessor to Nussbaum's more developed second generation account, and therefore of primarily historical interest to understanding the Capability Approach rather than a parallel account in its own right. The accounts of Sen and Nussbaum differ significantly in ways that relate to their different concerns and backgrounds:

- Nussbaum is concerned to produce a philosophically coherent *normative* theory of justice; Sen is concerned with producing a general framework for *evaluating* the quality of lives people can lead that can incorporate the very diverse concerns and dimensions that may be applicable.
- While Sen's approach is founded on enhancing individual freedom Nussbaum's theory is founded on respecting human dignity.
- Sen's comprehensive consequentialism makes room for incorporating empirical information about feasibility and instrumental relationships between capabilities when considering policies; Nussbaum largely rejects such instrumental analysis because she is wary of its 'Utilitarian associations'.
- Sen's Capability Approach in its normative developmental aspect, is mainly concerned with practical incremental improvements; Nussbaum's approach is rather more utopian in that it demands the full implementation of minimal justice for all and this is specified so demandingly that no country yet meets it.

“Being socially responsible is equally important to being profitable.” -Moss Kanter, Harvard Business Review.

### **Introduction:**

Today, the business must play an active role in community development is the growing realization among stakeholders and societies which is the universal phenomenon. CSR has been defined as a tool, contributing direct or indirectly to the company's bottom line and ensuring company's long-term sustainability. There is an increasing awareness all over the world about corporate social responsibility (CSR), sustainable development (SD) and non financial reporting (NFR) of companies. CSR entails the integration of social and environmental concerns by companies in their business operations and also their interactions with their stakeholders on a voluntary basis. Briefly, CSR is a concern of the business for societal welfare. The overarching goal of CSR is to support those changes which are towards sustainability. Since financial institutions including banks play a crucial role in economic and developmental activities, they can contribute a lot-off to sustainable development. In this context, in the developing countries like India, the demand by stakeholders that similar to other corporate banks should act as a responsible corporate citizen is growing rapidly. The studies across the corporate world have shown that companies performing CSR continued to sustain for longer duration than those not performing CSR. That is why today CSR is considered as a business necessity. A growing number of largest banks and financial institutions worldwide, including Goldman Sachs and Union Bank of Switzzarland now integrate environmental, social and corporate governance (ESG) issues into their business strategy and equity research. In recent times, banking companies are increasingly realizing that they must create a CSR campaign to attract and retain staff, since many employees prefer to work for socially conscious enterprises. Recently, a Bengaluru-based CSR management company NextGen analyzed the annual reports of top 100 Indian companies by market capitalization on National Stock Exchange for FY-2015 and FY-2016. According to the report, in FY-2016, the 91 NSE listed companies spent Rs.6033 crore on CSR initiatives in which the share of education sector was of Rs.1701.3 crore or 28.2%.

### **II – Objectives of the study:**

- i) To study and understand the concept of CSR as a business necessity.
- ii) To study the status of education as an area of interest in Indian corporate's CSR activities.
- iii) To study the major CSR thematic areas in selected public and private sector banks in India.
- iv) To take the overview of the CSR activities of banks in general and their support to education in particular.

**III – Scope and limitations of the study:** The scope of the present study is restricted to selected ten public and private sector banks only. The study has been conducted regarding CSR of these banks in general and their support to education in particular for FY-2015 and 2016. The general focus of the study is on the CSR practices of few Indian banks including private and public sector, but the prime focus is on their direct and indirect support to education. The main limitation of this paper is that the study is based only on secondary data. Out of the total banks operational in India, only ten banks are considered for the study. Finally, the study is based on these banks' CSR activities for two fiscal years. So, the results may differ in case of other banks and also for different fiscals.

**IV – Methodology:** Taking into account the scope and objectives of the study, the researcher has adopted descriptive research method based on extensive secondary data. The random sampling technique has been used while selecting the banks for the present study. The secondary data was analyzed according to the objectives of the study. The style of presentation is mostly analytical. The data was collected from secondary sources such as annual reports and sustainability reports of banks, websites of banks and companies, daily newspapers, books,

magazines and journals. Among the selected banks, five banks are major public sector players while remaining banks are from private sector. After selecting these ten banks randomly, equal ten CSR thematic areas were identified on the basis of the reports of the banks as well as other relevant literature. The overall CSR activities of the banks were coded and classified according to the objectives of the study. Each coded activity or area of the bank's CSR interest was allotted 10 points for calculating total score. Finally, the aggregate CSR score of all and each bank alongwith area-wise score was calculated to draw conclusions.

#### V - Education in CSR- The Indian Overview:

“Good quality education is a foundation for dynamic and equitable societies.”

-Desmond Tutu.

Education, especially quality education accessible to all classes of the society is the backbone of every societal development in the world. In India, funds coming to education, especially from CSR budgets of corporates are rising year after year. According to the CSR report by KPMG International, which is prepared on the basis of CSR policies and annual reports of 87 companies operating in India, Rs.6490 crore was the total outlay to be spent towards CSR for the companies in FY-2015. More than 50% spends on CSR (i.e.Rs 2592 crore) were allotted towards Health, Sanitation and Education which are basically schedule VII activities. Health (26%) is the priority sector for spending followed by education (24%) and environment (11%). According to this report, considering the sector-wise CSR spends by companies in FY-2015, Education sector received Rs. 1248.5 crore as CSR funds from companies. The another report by Futurescape in partnership with IIM Udaipur and the leading newspaper The Economic Times also highlighted that most companies invested in Education, Health, Environment and Rural Development initiatives as their community CSR activities in FY-2015. Considering education, most companies in India support the development or restoration of school infrastructure, provides funds, scholarships or adopts schools.

According to the data provided by the Ministry of Corporate Affairs GOI, in Loksabha Mansoon Session 2016, nearly Rs.8029 crore were spent by 4257 Indian corporates towards CSR initiatives, as their obligation towards social cause in FY 2015. In the same period, education emerged as the most preferred area for CSR activities among Indian companies. The private and public sector companies spent total amount of Rs.2519.92 crore for supporting education followed by environment and rural development sectors. As shown in table 1.1below, following are the areas in which the companies made highest CSR expenditure in FY-2015.

Table 1.1

#### Top 03 Sectors with highest CSR Expenditure in FY-2015

Sr.No.	Development Sector	CSR Expenditure (Rs.in crore)
1	Education	2519.92 (31.38%)
2	Environment and Animal Welfare	1205.75 (15.00%)
3	Rural Development	920.38 (11.40%)

Source: zeebiz.com, dt.30July 2016

Note: Figures in the bracket indicate ratio to total.

These figures in the table 1.1 make it clear that education is the favourite CSR activity with huge expenditure among private and public sector companies in India.

**VI- RBI's Guidelines on CSR and Non Financial Reporting:** RBI, as an apex banking regulatory authority of India has remarked that there is a lack of adequate awareness about CSR and sustainable development in the country and admits that banks can contribute more significantly to sustainable development. RBI circulated a notice to all scheduled commercial banks on December-20, 2007 with title, “CSR, Sustainable Development and Non-financial Reporting-Role of Banks’ to highlight their role in CSR and SD. Through this circular, RBI has issued some guidelines to Indian banking sector regarding their role in CSR. The RBI further highlights that sustainable development basically refers to the process of maintenance of the quality of environmental and social systems in the pursuit of economic development. RBI also suggested that banks should prepare a suitable plan of action to meet CSR objectives and sustainable development programmes approved by their Board of Directors. All these programmes and their progress should be reported by the banks in their annual reports. To highlight the importance of notice, RBI followed many international initiatives such as United Nations Environment Programme Finance Initiative (UNEP FI), Global Reporting Initiatives, the Equator Principles etc.

**VII - Current CSR Practices of selected Indian Banks:** In the corporate world including banks and financial institutions, CSR has been assuming greater importance. Banks and other financial institutions have started promoting environment friendly and socially responsible lending and investment practices. According to the report, 'Annual CSR Tracker-2016', prepared and published by Confederation of Indian Industry, public and private sector banks spent Rs.454.24 crore actually in FY-2015 as their CSR obligation which increased upto Rs. 563.64 crore in FY-2016 having 6.89% growth. The major key areas of CSR in Indian banking sector are depicted in table 1.2 below. After the close review and in-depth analysis of CSR initiatives of the ten banks operational in India, the classification of their CSR initiatives is presented in the following table which is based on the two categories i.e. presence of the areas in banks' CSR domain and the amount of expenditure for that area.

**Table 1.2 Areas of CSR initiatives in Indian Banks**

Sr. no.	Banks	CSR Areas										Agg. Score	Final Rank
		Area-1	Area-2	Area-3	Area-4	Area-5	Area-6	Area-7	Area-8	Area-9	Area-10		
1.	PNB	✓*	✓	✓	✓	✓*		✓	✓*			70	3 <sup>rd</sup>
2.	BOB	✓		✓*	✓*	✓*		✓	✓			60	4 <sup>th</sup>
3.	UBI	✓*	✓	✓	✓	✓*		✓*		✓		70	3 <sup>rd</sup>
4.	BOI	✓*	✓*	✓*	✓*		✓				✓	60	4 <sup>th</sup>
5.	Canara	✓	✓*	✓	✓	✓*		✓*				60	4 <sup>th</sup>
6.	ICICI	✓*	✓*	✓*		✓*	✓	✓	✓	✓		80	2 <sup>nd</sup>
7.	HDFC	✓*	✓*	✓*	✓	✓*	✓	✓	✓	✓*		90	1 <sup>st</sup>
8.	Yes	✓*	✓*	✓*		✓		✓		✓*		60	4 <sup>th</sup>
9.	Axis	✓*	✓*	✓*	✓*			✓		✓		60	4 <sup>th</sup>
10.	Federal	✓*	✓*		✓			✓			✓	50	5 <sup>th</sup>
11.	Aggregate Score	100	90	90	80	70	30	90	40	50	20		
12.	Final Rank	1	2	2	3	4	7	2	6	5	8		

Source: Compiled by the researcher from the annual reports, sustainability reports and web portals of the concerned banks.

Note: For those sectors with \* mean that the bank is heavily involved in the area with high CSR spending.

**CSR Areas:** Area-1 Education and Skilling, 2- Health and Sanitation, 3- Livelihood Creation, 4- Environment, 5- Rural Development, 6- Relief Funds, 7- Reducing inequalities, 8- Supporting Sports, 9- Technology Incubation, 10- Heritage and Veterans.

**Banks:** 1 PNB-Punjab National Bank, 2 BOB-Bank of Baroda, 3 UBI-Union Bank of India, 4 BOI-Bank of India, 5 Canara-Canara Bank, 6 ICICI-ICICI Bank, 7 HDFC-HDFC Bank, 8 Yes-Yes Bank, 9 Axis-Axis Bank, 10 Federal-Federal Bank.

**VIII – Discussion & Results:** On the basis of table 1.2 above, it is evident that all public and private sector banks perform CSR in nearby all ten identified areas. Taking into account the area-wise CSR initiatives of Indian banks, education and skilling sector have highest aggregate score because all the banks support education and skilling through their CSR. More important think to be noted here is that out of ten banks supporting education, eight (i.e. 80%) banks are heavily involved in education and skilling, spending a large share of their CSR budget for the sector.

Health and sanitation, livelihood and reducing inequalities are the next three areas which are present in nine (i.e. 90%) banks' CSR hence, ranked 2<sup>nd</sup>. Though, nine banks are performing in

these three areas, only seven (i.e. 70%) banks are involved in health and sanitation with high spending, followed by six (i.e. 60%) banks in livelihood creation and two (i.e. 20%) banks are heavily involved with high spending in the area reducing inequalities. As an area of intervention, eight (i.e. 80%) banks are performing their CSR in environment which is ranked 3<sup>rd</sup>. Though, eight banks are caring for environment, only three (i.e. 30%) banks are heavily involved in the sector with high spending. Rural development is another sector ranked 4<sup>th</sup> is preferred by seven (i.e. 70%) banks in CSR out of them six (i.e. 60%) banks are involved in the sector with high spending. Technology incubation which is ranked 5<sup>th</sup> is preferred by five (i.e. 50%) banks in their CSR with only two (i.e. 20%) banks' heavy involvement in the sector. Supporting sports is ranked 6<sup>th</sup> since four (i.e. 40%) banks are performing in this sector and only one (i.e. 10%) bank i.e. PNB is involved in supporting sports with high spending. As a CSR areas, contribution in Union, State and other relief funds is preferred by three (i.e. 30%) banks hence ranked 7<sup>th</sup> and none of the banks is heavily involved in the sector. Finally, the areas National Heritage Protection and Benefits for Armed Forces Veterans and their families is ranked eighth since only two (20%) banks are supporting for these two causes through CSR without any heavy involvement .

#### Results:

1. HDFC bank, a large private sector player is ranked 1<sup>st</sup> followed by ICICI bank ranked as 2<sup>nd</sup>.
2. Two public sector banks i. e. Punjab National Bank and Union Bank of India are ranked 3<sup>rd</sup> while 4<sup>th</sup> ranking is a mix of public and private sector banks.
3. The Federal Bank, having minimum score is ranked final i. e. 5<sup>th</sup>.
4. Based on the presence in CSR programme of the banks, education and skilling sector is ranked 1<sup>st</sup> followed by health and sanitation, livelihood and reducing inequalities.
5. Reducing inequalities is an initiative performed by most banks but funded heavily by few banks through their CSR.
6. Environment, the umbrella sector comprising few by-sectors is ranked 3<sup>rd</sup> followed by rural development, technology incubation and supporting sports.
7. The sectors, relief funds and heritage and veterans having minimum presence in banks' CSR are ranked seventh and eighth respectively.

**IX - Conclusion:** Indian education system comprising 15 lakh schools and 25 crore students enrollment have the budget of 2.7% of country's gross domestic product. To make this huge system capable for meeting the needs of future generation is an endeavor in itself and impossible without the active participation of all. Today, 29% of India's population is between the age-group of 0-14 years. If problems continue plaguing the education system, we all will have to face the shortage of skilled and smart man-power in future. As an area of priority in development process, corporate sector including public and private sector banks should support the education sector continuously with more spending from their CSR budgets.

## **ELECTRONIC BANKING TECHNOLOGY WITH REFERENCE TO INDIAN BANKING SECTOR**

**Dr. H.R.Tiwari & Dr. Nilam M.Chhangani**

Principal, Appaswami Mahavidhyalaya, Shendurjana (Adho), Dist. Washim. Maharashtra, Mob.no. 09527976741, principalappa@gmail.com

Head of the Department of Economics, Shri. Kisanlal Nathmal Goenka Arts & Commerce College, Karanja Lad. Dist. Washim., Mob.no. 09881948495, nilam\_chhangani@rediffmail.com

**Introduction:** In India, there prevailed a system of indigenous banking from very early times, though it was not similar to banking of modern times. There is evidence to show that money lending existed even during the Vedic period. With the advent of the English traders in the Seventeenth century and the establishment of trading centers by the East India Company, the position of indigenous bankers became precarious. Unable to use indigenous bankers for their trading and banking purposes, the East India Company, encouraged the establishment of agency houses-trading firms which undertook banking operations for the benefit of their constituents. Some of the important agency houses established during the period was Alexander & Co. & Fergusson & Co. These firms combined banking with other kinds of business and both were the predecessors of the early Joint Stock Banks in India. „The Bank of Hindustan“, a mere appendage of the former, was the earliest bank under European direction in India. „The Bank of Hindustan“ was the first bank in India, established in 1770. Since, 1770, the journey of Indian Banking System can be bifurcated into three distinct Phase.

According to **Indian Banking Regulation Act, 1949:**

“Banking” is defined as accepting, for the purpose of lending or investment, deposits of money from the public, repayable on demand or otherwise and withdraw able by cheque, draft, order or otherwise. [**Section 5(2)**]

**Overview of E –Banking System:** Electronic Banking (E-Banking/e-Banking) is a modern banking system. It is the accessibility of banking services in electronic form, which were traditionally available only at bank-counters and dispersed by the humans. E-Banking is changing the ways of doing banking business with modern technologies and techniques. It is the replacement of traditional tools such as papers and pencils with the electronic systems. The introduction of Internet in the business has further enhanced the capacity and capability of overall banking system in terms of productivity, profitability, efficiency, quality of service and cost effective delivery of numerous products/services. Information regarding money, its storage in the computers in digital form and its movement anywhere in the world without considering physical boundaries is described as digital money and this whole process as Electronic Banking. The following are the characteristics of modern banking system i.e. E-Banking (**Deutsche Bundesbank, 2000**):

- The transaction in electronic banking is no longer confined within the national borders due to their virtual nature i.e. electronic commerce based transactions. This intends that the banks need to cooperate even more closely with foreign bank’s authorities than in the past.
- The innovative cycles for new products on the Internet are becoming shorter and shorter due to rapid pace of technological changes. In some cases, the technology behind some products is already obsolete well before those products are ready for marketing.

**Global Scenario of E- Banking:** In Asia, the major factor restricting growth of E-banking is security, in spite of several countries being well connected via Internet. Access to high-quality E-banking products is an issue as well. Majority of the banks in Asia are just offering basic services compared with those of developed countries. Still, E-banking seems to have a future in Asia. It is considered that E-banking will succeed if the basic features, especially bill payment, are handled well. Bill payment was the most popular feature, cited by 40 percent of respondents of the survey. However, providing this service would be difficult for banks in Asia because it requires a high level of security and involves arranging transactions with a variety of players.

**Experience of India on E-Banking:** India is still in the early stages of E-banking growth and development. ///Competition and changes in technology and lifestyle in the last five years have changed the face of banking. The changes that have taken place impose on banks tough standards of competition and compliance. The issue here is – ‘Where does India stand in the scheme of E-banking.’ E-banking is likely to bring a host of

opportunities as well as unprecedented risks to the fundamental nature of banking in India. The impact of E-Banking in India is not yet apparent. Many global research companies believe that E-banking adoption in India in the near future would be slow compared to other major Asian countries. Indian E-banking is still nascent, although it is fast becoming a strategic necessity for most commercial banks, as competition increases from private banks and non banking financial institutions.

#### **New Phase of Indian Banking System, Reforms after 1991**

- This phase has introduced many more products and facilities in the banking sector as part of the reforms process.
- In 1991, under the chairmanship of M. Narasimham, a committee was set-up, which worked for the liberalization of banking practices.
- In this phase, the country is flooded with foreign banks and their ATM stations. Efforts are being put to give satisfactory service to customers.
- Phone banking and net banking are introduced. The entire system became more convenient and swift. Time is important in all money transactions.

**Electronic Banking Products and Services** E-banking has provided immense opportunities in offering goods and services to the customers. These products are totally changing the outlook of banking sector. Now the industry is shifting towards cashless society, where physical cash, notes and coins have become a thing of the past, and digital cash and electronic purse have taken their place. These are many non-cash payment methods which are in use. These are as follow:

- **Automated Teller Machine** ATM is a cash rending teller machine. This is a machine which is frequently seen at banks and other locations, such as shopping centre sand building societies. Customers can withdraw any sum up to a limited amount, can view the status of his account and order a new cheque book. There is a number called Personal Identification Number (PIN) which is a key for carrying the desired transactions. On the other hand, we can say that it's a machine which replaces the human aspect of providing the cash and standing in a long queue. ATMs can be installed on the bank's premises (onsite ATMs) for which no license is required from RBI. However, for ATMs to be installed at public places (offsite ATMs) banks have to obtain a license. These offsite ATMs are mainly installed at airports, railway stations, market places, petrol pumps, etc.
- **Mobile Banking** The traditional brick and mortar is done from fixed branch premises, where the customer has to go personally for carrying out business transactions. Through mobile banking the customer can conduct a host of banking transactions and inquiries through the mobile. Mobile banking can also be carried through a mobile van with or without computerized banking system. The mobile van moves from place to place on designated routes t designated hours and the customers can transact their banking business, such as deposit, withdrawal, cheque collection, draft issuance, pass book updates, etc. mobile banking helps the customer to do his account management, electronically which was earlier possible through internet banking. Mobile banking services is divided into two categories:

1. **SMS Based:**

2. **Menu Based:**

#### **Functionalities of Mobile Banking**

Mobile banking functionalities have been divided into three parts. In public category, the customer can openly access the exchange rates and interest rates of the economy as well as the banks. In private category, the customer can check the account balances, can administer the credit lines and can check the transactions. While conducting the transactions, mobile banking helps in transfer of funds, and in paying invoices.

- **Phone Banking:** Phone banking or Tele-banking refers to the authorized customers to use special telephone number of the banks. This facility is available with the help of the voice response system (VRS). This system basically accepts only TONE dialed input (For caller phone instruments for dialing necessary numbers) and suitable voice response message/information to the caller. Tele-banking is of two kinds:

1) **Public Enquiry:** General information about banking services is obtained by customer and non-customers like dialing a special enquiry number of the bank and desired information can be obtained.

2) **Private Enquiry:** This relates to account specific information and can be accessed only by account holder by disclosing personal identification number (PIN) and customer ID.

**Society for World-wide Inter-banking Financial Tele-communications (SWIFT):** It is a computerized message system which links banks around the world. In 1996, it was updated from centralized system to decentralized system. SWIFT is a co-operative organization formed by international bank and financial institutions. The member banks are shareholders of this society. It provides guarantee to carry messages without any mutilation of the message. The network provides round the clock service to any mutilation of the message.

**1. E-commerce:** E-commerce refers to the transaction between the buyer and seller without exchanging any papers or any meeting between two persons and largely using the internet. Electronic commerce allows efficient transactions among customers, suppliers and partners for cutting the transaction time and reducing the cost of doing business. The Ministry of Commerce is supporting “Electronic Commerce (EC) / Electronic Data Interchange (EDI) for Trade” product for facility international trade. The community partners of this project are various trade regulatory and facilitating agencies like the Customs Department, the Directorate General of Foreign Trade (DGFT), Airports, the Reserve Bank of India (RBI), Export Promotion Organizations (EPOs), Exporters, Importers, Agents, Container Corporation of India (CONCOR) and banks.

**2. Electronic Data Interchange (EDI):** EDI is the exchange of documents in the standardized electronic form between organizations in automated manners directly from a computer application in one organization to an application in another. EDI can be compared and contrasted with electronic mail. Email enables free-format textual messages to be electronically transmitted from one person to another. EDI on the other hand, supports structured business messages (those which are expressed in hard copy, pre-printed forms or business documents) and transmits them electronically between computer applications rather than between people.

**3. Internet Banking:** As the banking industry has been constantly innovating and with the advent of technological development particularly in the area of telecommunication and information technology, one such innovation is internet banking. Internet Banking is defined as an internet portal through which the customers can use different kinds of banking services from bill payments to making investment. All the banks using internet as an additional channel or banks using internet only as delivery channel are now on the equal footing to offer their banking services on the internet and to compete for customers around the world. Internet banking is useful for both the banker and the customers. The rationale use of internet banking technology from the bank point of view is mainly related to cost savings. Internet banking sites can be segregated into four categories from level I, which offers just minimum functionalities, such as access to one’s deposit account data, to level IV sites that offer sophisticated services. Generally, internet banking is offered in two ways. First, an existing branch with physical offices can establish a website and offer its customer internet banking in addition to traditional banking channels. Second way is that bank may be established as virtual branches or internet with a computer server at its heart that is housed in an office that serves as bank’s legal address. Virtual banks may offer customers the ability to deposit and withdraw the funds at automated teller machine or other remote channels used by the banks. Nevertheless, Internet banking has relatively high initial set-up costs, with saving following later and it appears, at present, that no major banks have achieved significant cost reductions through its provisions.

**4. Electronic Fund Transfer (EFT):** In the present age of integrated technology consisting of computers and communication facility, distances need no longer be constraint in providing customer services. EFT system hosted and operated by the RBI permits transfer of funds from any account to any other account at any branch of any member bank in any other city. In other words, electronic fund transfer facilitates the quick movement of deposit money from one bank account of one customer to the bank account of another customer. In this system, the sender and the receiver may be located at different cities. As an important tool of customer services, EFT system addresses the need of individual customers to transfer money from one place to another within a day or two. Following are the participants of this scheme:

- Individual customer through their banks/branches.
- Service branches of the bank.
- Reserve bank of India (National Clearing Centre and Deposit Account of RBI).

**6. E-Purse:** E-Commerce has been marked as a steady trend towards growth of electronic mode of payments against paper based instruments. European Central Bank ECB defined, “E-Money as electronic store of monetary value on a technical device and used to make payments other than the issues without the involvement of bank account in the transaction but acting as a prepaid bearing instrument”. It means E-banking is the future of banking system. It is important factor of present banking. In banking Sector of India find E-banking service is

considered a new era in electronic banking. But the success of E-banking not only depends on its special channels but also on the content of financial services. Now-a-days development of the economy and people's living conditions and other economic activities need the bank provide a full range of financial services through E-banking.

## **SPIRITUAL MANAGEMENT**

**Dr. Vilas S. Kolhe**

*Department of English, S.M.B.S.T. College, Sangamner*

### **Introduction:**

The term 'Management' is concerned with management of the people at work. Employees at work are the important element in every organization or institution. The way in which people are employed, developed and utilized by management largely determines whether the institution will achieve its objects. Therefore, the human resources available to management in the organization or institution need to be properly coordinated and utilized for the success of any institution. Management is constantly concerned with the organization's human resources and hence need to be understood in their proper perspective. Human resources have been considered multidimensional in nature. People at work comprise all individuals involved in any of the institutional activities, regardless of levels and socio-cultural backgrounds. Every individual is different from one another in respect of their intelligence, personality and physical appearance. Every individual has his/her set values, principles, needs and intentions. He/she has own habits, aspirations and expectations. It is but the fact that we do not find two human beings similar in mental abilities, tendencies and sentiments. There are many factors, such as; family relationship, religious influences, racial background, social and educational background, affect the individual as he/she works. It is observed that the people at work place provide a particular set of values, competencies, specialized knowledge and skills, even though they have different characteristics that are related to the achievement of institutional goals. While doing so it must be considered that people at are human beings and are responsive, they cannot be treated as machine. People are moved by emotions, ambitions, pride and prejudices, likes and dislikes, faiths and beliefs etc. Therefore, Management plays crucial role in handling the human elements at the work place. In order to understand the underlying significance of the role of management, we need to know the concept of personnel management which is an extension of general management. Edwin B.Flippo defines "Personnel Management is the planning, organizing, directing and controlling if the procurement, development, compensation, integration, maintenance and separation of human resources to the end of those individual, organizational and societal objectives are accomplished." The definition covers both the management functions and operative functions. On the same line, The Institute of Personnel Management in UK defines, "Personnel Management is that part of the management concerned with people at work and with their relationship within an enterprise. Its aim is to bring together and develop into an effective organization of the men and women who make upon enterprise and having regard for the wellbeing of the individual and of working groups, to enable them to make their best contribution to its success". The definitions mentioned above reveals that managing people in the institution/ organization is but human resource management and is dealt with people at work. Therefore, managing people at work is most crucial job and the importance of human resource management has to be considered from different perspectives; first is social significance of personnel management because it enhances the dignity of an employee at work by accomplishing their social needs. The second is professional significance because it provides healthy working environment and encourages spirit of team-work amongst the workers. In the present scenario, it would be significant to understand the nature of the scope of the spirituality at workplace. In this context, Nichols (1994) pointed out that companies must find ways to harness soul searching on the job through spirituality. So also, Neal (1997) states that "Spirituality in the work place is about people seeing their work as a spiritual path as an opportunity to grow personally and to contribute to society in a meaningful way. It is about learning to be more caring and compassionate with fellow employees, with bosses, with subordinates and customers..." This reveals that the spirituality at work place can help an individual to inculcate values, such as honesty, cooperation, morality, mercy, pity, peace and love which, at present, is the immediate need of the hour. Hence, it is utmost important to not only exercise our body but also to exercise and detoxify our mind. Practices like meditation, pranayama, deep breathing, positive affirmations, maintaining a gratitude journal is very powerful because it helps us find inner balance and peace and handle the stress of everyday life in a more positive way.

**Conclusion:** Thus to put above stated issues in a nutshell, it is observed that the need for mental, psychological and moral stability and result oriented outcomes from an employees is intensely felt by an organization. It for this reason that the world is following the footsteps of Indian ideology and its ancient Vedic philosophy in handling human resource management at work place.

## SIX SIGMA METHODOLOGIES: APPLICATION, BENEFITS AND SCOPE

**Pathan Salman Salim**

### **Introduction:**

Six Sigma refers to a process in which the range between the mean of a process quality measurement and the nearest specification limit is at least six times the standard deviation of the process. The quality management approaches, including Statistical Quality Control, Zero Defects and Total Quality Management, have been key features for many years, while Six Sigma is one of the more recent quality improvement initiatives to gain popularity and acceptance in many industries. Since its initiation at Motorola in the 1980s, many companies including GE, Honeywell, Sony, Caterpillar, and Johnson Controls have adopted Six Sigma and obtained substantial benefits. Six Sigma is a long-term program. It won't work well without full commitment from upper management. In recent years, interest from the academic community has increased very fast. Therefore, it is the best time to have an extensive review on the related literatures.

**Six Sigma Methods:** Six Sigma is based on six basic principles that help the implementation of Six Sigma method to production companies or service industries. Six Sigma uses the base tools to improve the quality of products and processes as Measurement System Analysis (MSA), IPO Diagram (Input-process-output), Cause-and Effect diagram (CE), Histogram, Pareto diagram, Define, Measure, Analyze, Improve, Control (DMAIC), Run chart, Control chart, Scatter diagram, Regression Analysis, Designing of Experiments (DOE), Failure Mode and Effect Analysis (FMEA), Standard Operating Procedure (SOP) and Quality Function Deployment (QFD).

**Measurement System Analysis:** Diffusion of the watched commodities' parameter can be connected by the commodity itself or the system of measuring. The system of measuring is made by operator, benchmark and the method of measuring. Measuring System Analysis (MSA) is a tool for the evaluation of accuracy and advisability of the measuring system. It goes with testing or measuring the chosen parameter by the operator. It monitors the influence of repeatability and reproducibility of the total variance. The goal of MSA is to estimate how the system of measuring contributes to the total variance of watched parameter. Most of the time, analysis of the measurement system is used in the phase of Measurements.

**Analysis of the Causes and Consequences:** CE is a tool to solve problems through finding the cause of their occurrence. It helps to find all possible causes, to split causes into categories and organize their relationships and impact on output, and to identify opportunities for improvement. In general, these categories are commonly known as 7 M causes:

- Man -people, job;
- Methods and mechanics, process;
- Machine – machines, equipment;
- Measurement;
- Management - system of organization and management;
- Material; and
- Mother Nature - environment.

**Histogram:** Histogram is a perfect tool for visualization of the frequency of the watched phenomenon in process. It is a bar chart made from number of categories, showing their splitting. Customer tolerance can be added (LSL, USL) to watched process.

**Pareto Diagram:** Pareto diagram is a bar chart for discrete data, indicating the frequency of non digital data. These categories are arranged in descending order. The tool that allows determining the impact of input factors to an endpoint.

**Dmaic:** It is the common option for the model of improving the process based on Deming's circle Plan-Do-Check-Act (PDCA). DMAIC is in the Six Sigma methodology being used as the standard routine for planning and implementation of the project.

Reported benefits of implementing six sigma:

**Manufacturing Sector:** Motorola was the first organization to use the term six sigma in the 1980s as part of its quality performance measurement and improvement program. Six sigma has since been successfully applied in other manufacturing organizations such as General Electric, Boeing, DuPont, Toshiba, Seagate, Allied Signal, Kodak, Honeywell, Texas Instruments, Sony, etc. The reported benefits and savings are composed and presented from investigating various literatures in six sigma.

**Financial Sector:** In recent years, finance and credit department are pressured to reduce cash collection cycle time and variation in collection performance to remain competitive. Typical six sigma projects in financial institutions include improving accuracy of allocation of cash to reduce bank charges, automatic payments, improving accuracy of reporting, reducing documentary credits defects, reducing check collection defects, and reducing variation in collector performance. Bank of America (BOA) is one of the pioneers in adopting and implementing six sigma concepts to stream-line operations, attract and retain customers, and create competitiveness over credit unions. It has hundreds of six sigma projects in areas of cross-selling, deposits, and problem resolution. BOA reported a 10.4% increase in customer satisfaction and 24% decrease in customer problems after implementing six sigma. American Express applied six sigma principles to improve external vendor processes, and eliminate non-received renewal credit cards. The result showed an improved sigma level of 0.3 in each case. Other financial institutions including, GE Capital Corp, JP Morgan Chase, and SunTrust Banks are using six sigma to focus on and improve customer requirements and satisfaction.

**Healthcare Sector:** Six sigma principles and the healthcare sector are very well matched because of the healthcare nature of zero tolerance for mistakes and potential for reducing medical errors. Some of the successfully implemented six sigma projects include improving timely and accurate claims reimbursement, streamlining the process of healthcare delivery, and reducing the inventory of surgical equipment and related costs. The radiology film library at the University of Texas MD Anderson Cancer Center also adopted six sigma and improved service activities greatly. Also in the same institution's outpatient CT exam lab, patient preparation times were reduced from 45 min to less than 5 min in many cases and there was a 45% increase in examinations with no additional machines or shifts.

**Engineering and Construction Sector:** In 2002, Bechtel Corporation, one of the largest engineering and construction companies in the world, reported savings of \$200 mn with an investment of \$30 mn in its six sigma program to identify and prevent rework and defects in everything from design to construction to ontime delivery of employee payroll. For example, six sigma was implemented to streamline the process of neutralizing chemical agents, and in a national telecommunications project to help optimize the management of cost and schedules.

**Research and Development Sector:** The objectives of implementing six sigma in R&D organizations are to reduce cost, increase speed to market, and improve R&D processes. To measure the effectiveness of six sigma, organizations need to focus on data-driven reviews, improved project success rate, and integration of R&D into regular work processes. One survey noted that as of 2003 only 37% of the respondents had formally implemented six sigma principles in their R&D organization reported that the development and manufacturing of the new prototype at W R Grace (Refining Industry) was cut to 8-9 months from 11-12 months by implementing the DFSS process. Figure 4 shows the conceptual benefits and improvement of implementing six sigma in R&D projects.

**Future of Six Sigma:** Six sigma is likely to remain as one of the key initiatives to improve the management process than just being remembered as one of the fads. The primary focus should be on improving overall management performance, not just pinpointing and counting defects. Researchers and practitioners are trying to integrate six sigma with other existing innovative management practices that have been around to make six sigma method even more attractive to different organizations that might have not started or fully implemented the six sigma method. Integrating and comparing principles and characteristics of six sigma with Total Quality Management, Human Resource Functions, Lean Production, ISO 9000, ISO 9001, the capability maturity model are all part of the quality community's effort to maximize the positive effect of the six sigma method.

**Table 1: Reported Benefits and Savings From Six Sigma in Manufacturing Sector**

Company/Project	Metric/Measures	Benefit/Savings
Motorola (1992)	In process defect levels	150 times reduction

Raytheon/aircraft integration systems	Depot maintenance inspection time	Reduced 88% as measured in day
GE/Railcar leasing business	Turnaround time at repair shops	62% reduction
Allied signal (Honeywell)/laminates plant in South Carolina	Capacity Cycle time Inventory On-time delivery	Up 50% Down 50% Down 50% Increased to near 100%
Allied signal (Honeywell)/bendix IQ brake pads	Concept-to-shipment cycle time	Reduced from 18 months to 8 months
Hughes aircraft's missiles systems group/wave soldering operations	Quality/productivity	Improved 1,000%/improved 500%
General electric	Financial	\$2 billion in 1999
Motorola (1999)	Financial	\$15 billion over 11 years
Dow chemical/rail delivery project expenditures	Financial	Savings of \$2.45 million in capital
DuPont/Yerkes plant in New York (2000)	Financial	Savings of more than \$25 million
Telefonica de espana (2001)	Financial	Savings and increases in revenue 30 million euro in the first 10 months
Texas instruments	Financial	\$ 600 million
Johnson and Johnson	Financial	\$ 500 million
Honeywell	Financial	\$1.2 billion

**Conclusion:** The fundamental idea of six sigma is that if performance is improved, quality, capacity, cycle time, inventory levels, and other key factors as reduction waste, energy sources and environment will also improve. Thus, when these factors are improved, both the provider and the customer experience greater satisfaction in performing business transactions. Successful implementation and growing organizational interest in six sigma method have been exploding in the last few years. It is rapidly becoming a major driving force for many technology-driven, project-driven organizations. Factors influencing successful six sigma projects include management involvement and organizational commitment, project management and control skills, cultural change, and continuous training.

## MEASURING HUMAN PROGRESS: THE CONTRIBUTION OF THE HUMAN DEVELOPMENT INDEX AND RELATED INDICES

Dr. Dnyandeo E.Zine

Associate Professor & Head Dept. Of Economics, Arts, Commerce And Science College Sonai

### **Abstract**

*This brief note reviews the contributions of the human development approach and, in particular, of the HDI in the context of the discussions and debates around the findings of the Commission on the Measurement of Economic Performance and Social Progress (CESMP), set up by President Sarkozy of France and led by Joseph Stiglitz, Jean-Paul Fitoussi and Amartya Sen. We highlight the kinds of analyses and insights which have made the HDI a useful policy tool since 1990. There are important complementarities and synergies between the work of the recent Commission and the HDRs over the past twenty years. Both stress the need to focus on the ultimate objective of human prosperity and well being. They converge on the point that GDP is only one of the “intermediate” indicators used in attempts to measure the achievement of that final objective. Finally, but not least, we review ways in which the 2010 HDR, entitled “The Real Wealth of Nations: Pathways to Human Development”, published twenty years after the first HDR, has addressed some key challenges on the measurement agenda, and continued the HDR tradition of “pushing the frontiers”*

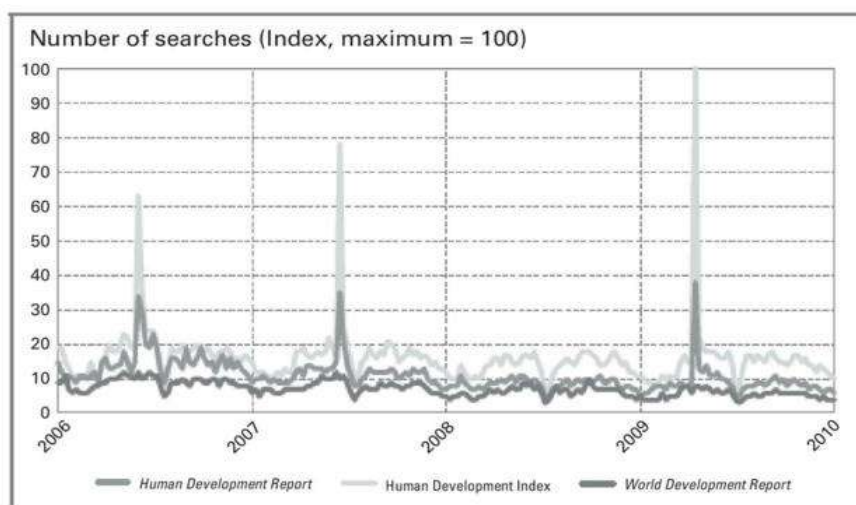

**Keywords:-** human development approach, complementarities, synergies.

**Introduction:** Since its launch in 1990, the Human Development Index (HDI) has been an important marker of attempts to broaden measures of progress. Published annually in the UNDP’s Human Development Reports (HDR), the HDI serves multiple functions for academics and policymakers, as well as activists. From the outset, it has been recognized to represent a work-in-progress, as well as a rallying cry for all those seeking inclusive and humane societies, by assessing past trends and patterns and evaluating our current condition. This brief note reviews the contributions of the human development approach and, in particular, of the HDI in the context of the discussions and debates around the findings of the Commission on the Measurement of Economic Performance and Social Progress (CESMP), set up by President Sarkozy of France and led by Joseph Stiglitz, Jean-Paul Fitoussi and Amartya Sen. We highlight the kinds of analyses and insights which have made the HDI a useful policy tool since 1990. There are important complementarities and synergies between the work of the recent Commission and the HDRs over the past twenty years. Both stress the need to focus on the ultimate objective of human prosperity and well being. They converge on the point that GDP is only one of the “intermediate” indicators used in attempts to measure the achievement of that final objective. Finally, but not least, we review ways in which the 2010 HDR, entitled “The Real Wealth of Nations: Pathways to Human Development”, published twenty years after the first HDR, has addressed some key challenges on the measurement agenda, and continued the HDR tradition of “pushing the frontiers”

**The HDI – contributions and some insights:** The idea that progress should be conceived as a process of enlarging people’s choices and enhancing their capabilities is the central premise of the human development report launched by the UNDP in 1990. The work of the report was designed and led by Mahbub-ul Haq and was inspired by and drew heavily from the capabilities approach, as developed by Amartya Sen in his books and writings. The 1990 *Human Development Report* clearly articulated the concept of human development. The first chapter, *Defining and Measuring Human Development*, opened with the forthright statement that: People are the real wealth of a nation. The basic objective of development is to create an enabling environment for people to live long, healthy and creative lives. This may appear to be a simple truth. But it is often forgotten in the immediate concern with the accumulation of commodities and financial wealth. This goal was not new. Thinkers from Aristotle onward have voiced similar positions. The report argued for renewed attention to people in the light of countries’ uneven progress in human development in the 1980s, a decade of economic crisis for many developing countries, particularly in Latin America and Africa. A hallmark of the 1990 HDR was the

introduction of a new measure of levels and progress in wellbeing - the Human Development Index (HDI). The HDI seeks to capture three basic dimensions of well-being – viz. a long and healthy life, access to knowledge and a decent standard of living in a very simple and transparent formulation. The HDI was thus a critical enlargement on conventional measures limited solely to income. Its widespread acceptance and use is reflected, for example, in extensive citations in the popular press and media – one survey of available archives found that there have been over 9,000 English language news articles published on the HDR since 1990. While the HDI was an early pioneer in multidimensional measures, its traction has been sustained. Its reach is extensive and has been facilitated by electronic access. After the 2009 global HDR was launched, for example, the HDR website was visited nearly 3 million times, and almost half a million copies were downloaded. This is shown graphically in Figure 1 below, using Google Scholar. In academic publications, the HDR “beats” the WDR, but the HDI “beats” both. The peak HDR frequency in 2009 corresponds to about 3 million searches. The HDI’s strengths—particularly its transparency, simplicity and popular resonance around the world—have kept it at the forefront of the growing array of alternatives to gross domestic product (GDP) in measuring wellbeing. Of course one can criticize the HDI for having attracted more of a media than a policy response, though we would argue that rankings matter for governments and that the HDI has helped to raise the profile of important issues – such as where performance in education is lagging – and has been used to guide policy, as we illustrate below. The extent to which the HDI and human development approach has managed to engage economists is addressed further below. We also recognize that the HDI has received its share of criticism, and review these further below. Suffice to note here that some authors take issue with its construction and composition, while others suggest it should be expanded to include more dimensions, ranging from gender equity to biodiversity. These critiques are important, but it is important to underline that the objective of the HDI is not to build an unassailable indicator of wellbeing, but rather to redirect attention towards people-centred development and to promote debate over how we advance the progress of societies. On these fronts the HDI has enjoyed significant success.

**Figure 1 -Frequency of Google Searches (2006-2010): HDR, HDI and WDR**

The global HDI has inspired and fostered innovation in the measurement of well-being at the local, national and regional levels [7][7] For a survey of examples of innovation in measurement... For example, *The Measure of America* presents human development rankings for U. S. states, congressional districts, and ethnic groups. It describes stark disparities – including that it would take the bottom-ranked state (Mississippi) 30 years to reach the same level of human development as the top-ranked state (Connecticut), given historical rates of progress. The average resident in the richest congressional district, New York City’s Upper East Side, earns over triple, lives almost five years longer and is ten times more likely to have a college degree than someone born in the bottom-ranked district, Fresno, California. Many of the U. S.’s national averages, other than income, also compare poorly to those of other advanced countries.

**The 2010 Report: Rethinking Human Development:** The year 2010 marks the twentieth anniversary of the Human Development Report, and thus offers an opportunity for re-assessing our understanding of human development. In very important respects, human development is an unfinished agenda and deserves deeper explorations, in several directions. We need to continue to explore the ways in which people can consider, and agree on defining and prioritising alternative dimensions of human development. The discussion here selectively focuses on dimensions missing from the HDI and subjective measures of well-being and inequality, which are just several among a broader agenda presently being explored.

**Table 1 Selected criticisms of the Human Development Index and responses**

**Conclusion:-** At the same time we should underline the importance of local specificity. From its beginnings, the HDR has argued for taking seriously the role of local specificity in thinking about economic and social development. And since 1990, dominant policy and intellectual views about the causes and nature of changes in economic and social development have evolved significantly in the direction of recognizing the need to take account of national and regional specificities in the definition of development strategies, which was part of the demise of, at least, the simplistic version of the “Washington Consensus.” This recognition underlines the inherent limitations of global indicators and rankings, even if such exercises can help prompt focus and consideration of locally appropriate responses to improve performance and the prospects for sustainable human development.

Criticism	Responses
Too few dimensions	The HDI has consistently measured the progress in three basic dimensions, which has an important advantage in terms of simplicity. It has never purported to be a comprehensive measure, instead complementary measures are presented.
Correlation among indicators	A positive correlation among the indicators is a sign that they measure the same phenomenon or construct. At the same time, the correlation does vary across country groupings – e.g. the correlation between income (GNI) and life expectancy across all the HDI countries is 0.808, but only 0.326 for the very high HD countries, and 0.205 for low HD countries.
Extrapolation for missing values	Kept to a minimum. In 2010 the only model-based imputed values were for expected years of schooling for three countries.
Mixing stock and flow indicators	Difficult to avoid with available international data. The only clearly flow indicator is GNI.

## IMPORTANCE & STATUS OF GOAT FARMING IN INDIA

**Dr. G. D. Kharat**

*Associate Professor in Economics, M. G. Vidyamandir's Arts and Commerce College, Yeola  
Tal-Yeola, Dist-Nashik, (Maharashtra)*

### **Introduction:**

The goats have become steadily important in the rural economy particularly in the arid, semi-arid and mountainous regions of the country. India is still a rural country in terms of population & its dependence on agriculture & allied sectors for livelihood. Near about 22% of population is in poverty & most of the downtrodden are facing the problem seriously. 68.84 % of population is still living in Rural India which depends on agriculture & livestock. Goat farming is one of the solutions to survive in the problematic life of rural India. Goat farming is the life line for small farmers, landless labourers & other resource less people of India. Goat is the poor man's cow in India. Goat is called as the foster mother of man. In rural areas, goat farming plays a vital role in providing gainful employment. Goat farming is the sustainable income source of women in India. Goat farming is a profitable business. Goat is a naturally gifted animal & useful for marketing of various products.

**Research Methodology:** This Paper highlights the status & importance of goat farming in India. Information & Data about the Research Paper has been collected from the various secondary sources such as Websites, Research Articles, Reference Books, Govt. Reports, and Journals.

### ▪ **Objectives**

Following are the main objectives of the Research Paper.

- 1) To study the importance of Goat Farming in India.
- 2) To study the status of Goat Farming in India.
- 3) To study the growth & contribution of Goat Farming in National Economy.

**Importance of Goat Farming:** Goat is a naturally gifted animal & useful for marketing of various products. Goat farming is a social as well as commercial business in India. Goat farming provides economic & other benefits to the involved people & society. The importance of goat farming is as under.

**A) Mini Cow:** Goat has been described as a poor man's cow (or mini-cow) because of its immense contribution to the poor man's economy. They not only supply nutritious and easily digestible milk to their children but also regular source of additional income for poor and landless or marginal farmers. Being small-sized animals, goats can easily be managed by women and children. Capital investment and feeding costs are also quite low. Four goats can be maintained as cheaply as one indigenous cow. Goats can be successfully reared in areas where fodder resources are limited. In rural areas, goat farming plays a vital role in providing gainful employment. Goat farming suits India's climate and economic situation. This is evident from the fact that every year 1/3<sup>rd</sup> of goats are slaughtered but the population has been constantly rising. It was 40.7 million in 1951 and now India has a goat population of 135 million as per the census of 2012.

**B) Income Source:** Goat as a source of supplementing household income is getting increasing attention especially among the landless agricultural laborers and small and marginal farmers mostly belonging to Muslim and other marginalized groups. Women are increasingly finding it as a potential source of earning cash income to meet their personal requirements like buying ornaments; cloths etc. since the men mostly concentrate on large animals and pocket the earnings for other needs of family.

**C) Food Supply:** The Muslim festival of EID is one important factor for rearing goats in the area as a large number of goats are reared for sacrifice during this festival and rural people find it economically very rewarding to rear goats for sale.

**D) Low Investment & Profitability:** Goats give more production per unit of investment. The large animals do not fit well into their household and infrastructural paradigms and goat has little requirements, thus, it is getting

popular with advancing times. Goat farming can be a profitable occupation for a farmer and can fit well into mixed farming.

**E) Environment Suitability:** Goats have very few demands of housing and management. They hardly need separate housing and happily share their homes with their owners or his other livestock. Goats are cheaper to maintain, easily available and have a friendly disposition. Goats are capable of adapting to various agro-climatic conditions ranging from arid dry to cold arid to hot humid altitudes.

**F) Multipurpose Animal:** The goat is a multi-purpose animal producing meat, milk, hide, fiber and manure. In hilly areas, goats are also used for hauling light loads.

**G) Foster Mother of Man:** Goats are called the foster mother of man, as their milk is considered better for human nutrition than other species of livestock. Goat milk is cheap, wholesome, easily digestible and nutritious. Goat manure is 2.5 times richer in nitrogen and phosphoric acid than cow manure. Goats form an excellent animal for physiological and biomedical research.

**H) Milk Qualities & Products:** Goat milk is finer than cow milk i.e. the fats and proteins are present in a finer state and are more easily digestible, especially by children and invalids. Goat milk has lesser allergic problems than other species of livestock. Goat milk is used as a ayurvedic medicine for persons ailing with asthma, cough, diabetes etc. Goat milk has higher buffering qualities and this enhances its value for patients suffering from peptic ulcers, liver dysfunction, jaundice, biliary disorders and other digestive problems. Goat milk has higher phosphate content, which is beneficial for vegetarian communities. Goat milk has a higher content of B-complex vitamins. Goat milk is suitable for preparing various milk products. Goats can be milked as often as required, preventing milk storage problems and refrigeration costs. Goat hide is used for the manufacture of leather products. Goat hairs are used for the manufacture of rugs and ropes. Pashmina shawls, Mohair and Kashmiri carpets are in great demand and are sold at very high prices.

**I) Commercial Goat Farming:** Commercial Goat Farming familiarized in Uttar Pradesh, Madhya Pradesh, Maharashtra, Rajasthan, Punjab, Tamil Nadu and Bihar. Some of these commercial farms seemed to have adopted certain innovative ways of marketing and created niche markets for themselves. The efficient marketing and remunerative prices of output are the pre-requisite for the development of any enterprise. The marketing of goats, which is totally unorganized, has been least studied.

**Status of Goat Farming:** At present the population of goats in India is more than 135 million. It accounts for more than 25% of the total livestock population in the country and contributes millions annually to the national economy and provides food and nutrition security to the millions of marginal and small farmers and agricultural labourers. Goat population in India has increased at a faster rate than that of other species of farm animals. In India, the contribution of livestock sector to Gross Domestic Product (GDP) is rising though the contribution of agricultural sector in general is witnessing a declining trend. This indicates that India is moving towards industrialization like developed countries where livestock sub sector contribute over 50% of the agricultural sector's contribution. In such a situation, goats are going to be even more important source of livelihood for many more people in coming years, thus, deserve greater attention both at micro and macro level.

▪ **World Goat Farming**

Country/Region	Total (Million)	Animals	Goat (MT)	Milk	Goat Meat (Million MT)
Asia	511.3		8.89		3.4
Afghanistan	6.38		0.11		0.04
<b>India</b>	<b>125.7</b>		<b>4.0</b>		<b>0.48</b>

#### Reference – Wikipedia

The above chart shows that India is the 2<sup>nd</sup> largest country after China in terms of livestock. India is the important country of the world in terms of goat milk & meat. The chart explains that India is the leading contributor in goat milk production & goat meat in the world. Asia continent is the subcontinent having largest part of livestock, goat milk & meat.

- **Growth and Distribution of Livestock in India:** The goats during the last few decades have become steadily important in the rural economy, particularly in the arid and semiarid regions. In 1951, the total number of livestock in the country was 292.80 million.

#### ▪ Growth Rate of Major Livestock in India

Species	Population (million)		Annual Compound Growth Rate (%)			
	1951	2003	1972-82	1982-92	1992-03	1971-03
Cattle	155.3 (53.04)	185.18 (38.18)	0.76	0.61	0.99	0.13
Buffalo	43.40 (14.82)	96.62 (19.92)	1.96	1.89	1.38	1.73
Sheep	39.10 (13.35)	61.47 (12.67)	2.01	0.40	1.93	1.43
Goat	47.20 (16.12)	124.36 (25.66)	3.50	1.93	0.78	2.04
Livestock	292.80	485.00	1.73	1.44	0.31	1.05

Source: Livestock Census, Govt. of India

Note: The figures in parentheses indicate percent to total livestock population

The number of goats has increased at the fastest rate among the major livestock species. The increase in goat population from 47.2 million in 1951-52 to 124.36 million in 2003 gave a mean rate of increment of 1.51 million per annum and annual compound growth rate of 1.92 percent. Combining the annual growth rate with mean slaughter rate of around 40 percent and mortality rate of about 15 percent, goats have shown the potential of population growth of about 57 percent per year.

#### Livestock in India (Thousands)

CATEGORY	2007	2012	Change %
Cattle	1,99,075	1,90,904	-4.10
Buffalo	1,05,342	1,08,702	3.19
Yaks	83	77	-7.64
Mithuns	264	298	12.88
Bovine	3,04,764	2,99,981	-1.57

<b>TOTAL LIVESTOCK</b>	<b>5,29,696</b>	<b>5,12,057</b>	<b>-3.33</b>

Reference – Livestock Census, Govt. of India

The goats constituted impressive share of the total livestock population. The number of goats were 1,40,537 & 1,35,173 in 2007 & 2012 respectively. There is a decrease in goat livestock due to deforestation & environmental issues. Goat contributes 25.66 % of the total livestock population of India in 2012. Overall livestock of India was 5,29,696 in 2007 which has decreased to 5,12,057 in 2012. Livestock is a income source of society as well as economy. Local, National & international factors are responsible for the decrease in livestock which is a serious matter of our existence.

▪ **Goat Population in India (Thousands) 2012**

Year	Female	Male	Total
1992	83,061	32,218	115,279
1997	86,757	35,965	122722
2003	88,543	35,815	124358
2007	99,744	40,793	140,537
2012	97,556	37,617	135,173

**Reference - Livestock Census, Govt. of India 2012**

The above chart shows the classification of goat population since 1992 in India. The goat population was 115,279 in 1992 which has increased to 135,173 in 2012. There is increase in male & female population of goat in correspondence period. Female goat population is larger than male goat population as per the available record which is good sign for the goat farming. The female & male goat population was 83,061 & 32,218 respectively in 1992 which is increased to 97,556 & 37,617 respectively for the year 2012.

▪ **Contribution of Goats to the Indian Economy 2005-06**

Items	Quantity (000' tones)	Value (Crore Rs.)
Meat	521.00	5210.00
Milk	2 3790.00	3032.00
Pashmina	3 0.041	6.15
Offals	4 379.23	738.75
Manure	5 17211.00	1032.66
Blood	6 54.18	18 24.63
Skin	7 129.60	518.40
Increment in stock	8 0.83	70.90
Total	553,795.881	10633.49

**Reference – National Accounts Statistics (CSO), 2006.**

Goat is a multipurpose animal of India. Each & every part of goat is cash earning source for the people & economy. The goats and their products contribute Rs 10633.49 Crore annually to the national economy accounting for around 8 percent of the Gross Domestic Product (GDP) from livestock sector, which contribute more than 30 percent of GDP from agricultural sector. The goats contribute significantly to the Indian economy by providing sustenance to rural resource poor especially in the arid and semi-arid regions.

**Conclusions:** Rural life is based on goat farming. Small, marginal farmers and landless laborers were the group having interest in goat keeping. Goats were reared mainly for meat purpose. Sale/purchase of goats increases during the Muslim festivals like Eid. Goats are treated as ready cash as they could be disposed off easily, locally and at a reasonable price. Women are engaged with their children in the business of goat farming. Goat farming is a family business in India. Commercial goat farming is the need of hour for India in the marketing world. Goat is the cow of poor man. Goat farming contributes in economy through milk products & meat. Technical, extension and marketing support should be provided to the people engaged in goat business. Goat farming is contributing in the women empowerment especially in rural India. The economically poor should be encouraged through education & training to take up goat husbandry for their upliftment. Use of goat milk also should be promoted among the society. Government agencies, bankers, academicians and NGOs have to play a vital role in these efforts.

## RECENT TRENDS AND IMPACT OF E-COMMERCE IN INDIA

**Prof (Dr.) Vishwas B. Chavan**

*Vice Principal, Konkan Unnati Mitra Mandal's, Vasanttrao Naik College of Arts and Commerce, Murud-Janjira, Dist. Raigad, 402401*

### **Abstract**

*The E-commerce has completely revolutionized the conventional concept of business. E-commerce deals with selling and purchasing of goods and services through internet and computer networks. This paper attempts to highlight the different challenges faced by the E-commerce in India, understand the essential growth factors required for E-commerce, describes the prosperity of E-Commerce in India and retail E-Commerce sales in India. The paper reveals the recent trends and impact of e-commerce in India. With rising use of internet and Smartphone, e-commerce has witnessed a strong growth in India in the past and the total size has jumped from US \$ 2.9 billion in 2013 to US \$16 billion in 2015 at a compounded annual growth rate of 34%. It is the India's fastest growing market; it will touch 36.7 billion by 2020. Effective implementation of government's fastest growing programs such as digital India, Make in India, Skill development will help to overcome challenges related to ineffective rural internet penetration & lack of skilled manpower. GST may enhance the growth of e-commerce. Evolution of new payment solution will also ease the transaction. Rural India has also accepted the new development of e-commerce, but it will take some time to become habitual. For country such as India, one of the most important benefits of e-commerce is its potential to help a developing rural community to leap-frog into the knowledge paradigm.*

### **I Introduction:-**

E-Commerce stands for electronic commerce. Dealing in goods and services through the electronic media and internet is called as E-commerce. E-Commerce or E-business involves carrying on a business with the help of the internet and by using the information technology like Electronic Data Interchange (EDI). E-Commerce relates to the website of the vendor, who sells products or services directly to the customer from the portal using a digital shopping cart or digital shopping basket system and allows payment through credit card, debit card or electronic fund transfer payments. Before 40 years the commerce concept created very important aspect in its area and turned in to E-Commerce, which is the buying & selling of goods & services through the Internet. Over the last ten years, the way of buying & selling goods & services has been changed by the internet. E-commerce is transforming the shopping experience of Indian Customers. The introduction of electronic data interchange spreads into producer, retailers, stock market operation & travel reservation etc. which resulted in a higher growth of the economy. In few foreign countries it is a regular process for the seller & buyer, and today more than 85% of the customer is buying products on a daily basis, like online bill, online shopping, payment of purchasing from an e-retailer etc. also known as business to consumer e-commerce (B2C). Another form of e-commerce involves transaction from one consumer to another and is known as consumer to consumer e-commerce (C2C) such as eBay, OLX, Quicker, Flipchart etc. Business to Business (B2B) refers to situation in which one business make a transaction with other. In 2006, there were only 21 million active internet users, which rose to about 354 million by June 2015. However the penetration of e-commerce is low as compared to markets like the USA, France & the UK, but is growing at much faster rate, adding around 6 million new entrants every month. According to study conducted by the Internet & Mobile Association of India the e-commerce sector is estimated to reach Rs.2, 11,005 crores by December 2016. The Association also states that the Indian online retail market is expected to grow at the rate of 52%. Electronics & Apparel are the biggest categories in terms of sales. By 2020, India is expected to generate \$100 billion online retail revenue out of which \$ 35 billion will be through fashion e-commerce. Online apparel sales set to grow four times in coming years. As per the report, the compound annual growth rates in the mature E-commerce markets of Japan, South Korea and Australia will run 11% to 12% over the next few years. In the rapidly growing markets of China and

India, these growth rates will be 25% and 57% respectively. The report also highlights the rapid growth of E-commerce markets in neighboring China where, the compound annual growth rates of over 20% will take the market to over \$ 350 billion. A report by the Internet and Mobile Association of India (IAMAI) has revealed that India's E-commerce market expected to grow by 37% to reach U.S. Dollar 20 billion by 2015.

## II. Objectives of study –

1. To study the concept of E-commerce.
2. To analyze the present trends of E-commerce in India.
3. To study the impact of e-commerce on Indian economy over the past few years.
4. To study the growth of e-commerce on the Indian economy.

**III Research Methodology** – The research paper is based on the secondary data collected from various magazines, articles, news paper, various websites & books on the various aspects of the growth of e-commerce in India & its impact on the Indian economy.

## IV Analysis of Data:

**A. Internet Users** – In 2006, there were only 21 million active internet users, which rose to more than 100 million internet users in the year 2010 & this value reached 121 million users by the end of 2011. IAMAI report says that over all internet penetration in India is currently around 31%. The number of internet user in India is expected to 450-465 million by June 2017, up 4.8% from 432 million in December 2016. Urban India with an estimated population of 444 million already has 269 million (60%) using the Internet. Rural India with an estimated population of 906 million as per 2011 census has only 163 million (17%) internet users. Thus, there are potential approximately 750 million users still in rural India who are yet to become internet users if only they can be reached out properly.

## B. Recent trends in E-Commerce-

- Now day's large number of shopping use smart phones tables & other mobile devices are the main tool for accessing internet or browsing E-commerce company websites for their convenience.
- Social commerce is a subject of e-commerce that involves social media & online buying & Selling of products & services.
- Video based marketing is unavoidable in our shopping experience, it will increase sales by better helping people perceive their choice.
- New technologies like facial recognition, virtual fitting rooms, etc. plays most import role in current e-commerce system.
- Promotion of products, recruitment through social media, the pattern of advertisement by corporate sector etc. are made online.
- Various innovative models are being tested and launched in the market.
- Increasing trust in E-commerce companies.
- There are customer's delightment due to fast delivery, easy payment & easy returned policy.

**C. Online retail in India** – The number of consumers who purchase online is expected to cross 100 million by 2017 end with e-retail market likely jumping 65% on year in 2018 ASSOCHAM –Resurgent India study report says that by the end of 2018, Indian e-retail is expected to touch \$ 17.52 billion. The total retail sales are growing at an impressive rate of 15% registering a double digit growth figure year after year.

## D. EVOLUTION OF E-COMMERCE

### Number of online shopping in India in Million

2013	20
2015	39
2018*	140
2020*	220

### Total E-commerce size (US \$ Billions)

2013	2.90
2014	13.60
2015	16.00
2018*	40.30
2020*	101.90

\* Expected. Source – CII & Deloitte.

**V Challenge of e-commerce:-** Despite of several opportunities in the e-commerce space in India, there are several challenges of e-commerce to be faced by the online shoppers & sellers. □

**1. Product and Market Strategy:** E-commerce companies have to address issues pertaining to rapidly evolving customer segments and product portfolios access information on market intelligence on growth, size and share manage multiple customer engagement platforms focus on expansion into new geographies, brands and products and simultaneously tackle a hypercompetitive pricing environment.

**2 Customer and Digital Experience:** Problems for Rural customers due to low internet speed. Companies have to provide a rich, fresh and simple customer experience not geared towards discovery, manage inconsistent brand experience across platforms; manage proliferation of technologies; and handle time to market pressure for new applications. In the recent past, social media has become more influential than paid marketing.

**3. Payments and Transactions:** In India, Customer does not trust online marketing, as they are suspicious about the quality, price, delivery etc. Even in rural areas there are no perfect channels of distribution. E-commerce companies may face issues around security and privacy breach and controlling fictitious transactions. Problem of language mostly in Rural areas. Further, RBI restrictions for prepaid instruments or E-Wallets act as impediments. There are no specific e-commerce laws. The sector is governed by the IT Act 2000.

**4. Organization Scaling:** E-commerce companies will have to make sure organization design keeps pace with the rapidly evolving business strategy, along with fluid governance, strong leadership and management development. From a growth perspective, indentifying acquisition opportunities, fund raising and IPO readiness becomes necessary. From a technology perspective, it is important to transform IT as an innovation hub and address the lack of synergy between business, technology and operations functions of the enterprise.

**5. Tax and Regulatory Structuring:** Companies will need to address issues around sub optimal warehouse tax planning imbalance between FDI norms vis-à-vis adequate entity controls, inefficient holding IPR or entity structure and international tax inefficiencies. Future challenges include the new companies act, policy on related party transaction pricing and the uncertainty around GST roadmap.

**6. Risk Fraud and Cyber Security:** From a risk perspective E-commerce companies could face issues around brand risk, insider threats and website uptime. Issues around employee vendor nexus, bribery and corruption make companies vulnerable to fines. Cyber security also raises some concerns around website exploitation by external entities.

**7. Compliance Framework:** E-commerce companies have to comply with several laws, many of which are still evolving. Potential issues around cyber law compliance, inefficient anti corruption framework, legal exposure in agreements or arrangements, indirect and direct tax compliance framework and rules and regulations could pose problems. Uncertainty around VAT implications in different states due to peculiar business modes could cause issues.

**VI Impact of E-commerce.** E-Commerce is a growing sector in India. Just like the growth of IT industry in India through the 1990s, the 2010s will be remembered for the growth in the E-Commerce industry. In its present state the contribution of E-Commerce to GDP is around 0.2% which is expected to grow 15 times to around 2.5% by 2030. The impact is so huge that the present wave of de-monetisation could have not been thought if E-Commerce did not exist. By 2030 the contribution to GDP by E-Commerce is expected to reach to around 300 Billion Dollars which is around 20 Billion Dollars in its present state.

1. **Technology-** One of the major drivers of technology will be E-Commerce industry and vice versa. We are seeing new age technological solutions being taken up to solve the business problems to bring commerce to everyone digitally. This is seen in both B2C and B2B sector. Investment into technology sector is happening to drive growth in the E-Commerce domain.

2. **Logistics-** Logistics industry is both a bottleneck and a driver for e-commerce. For the same we see how last mile and inter-city logistics solutions have come up to digitally connect the different stakeholders across the country. The Uber model of moving passengers is implemented in some form or the other in the logistic sector. The growth of E-Commerce will drive innovation in the logistic sector to make the products available to the end user.

3. **Travel-** At the moment 70% of the contribution to E-Commerce comes from the travel sector which includes the online ticket bookings to other travel arrangements. This has made the market competitive by bringing all players on the same platform and has also given consumer more options. Travel industry will be earliest adopters to become completely digitised.

4. **Education-** The ability of E-Commerce to provide quality education to everyone is immense. India will have one of the biggest set of youth population and hence the scope for education sector to be the biggest achievers because of E-Commerce is sure.

5. **E-Retail-** The flag bearers of the E-commerce wave have been the various E-Retail commerce platforms. E-Retail sector is projected to contribute to around 3% of the total Retail sells by 2020 and is at present around 1%. This wave is seen in both B2C and C2C model and is bound to grow further.

6. **Other Industries-** The way of working in the Real Estate sector is already seeing the change because of the E-Commerce industry. This will change further with all property related transactions coming online and getting closed online as well. Banking sector is benefiting as well with reduced operations cost of online transactions. E-Commerce in health care has brought health related solutions to the urban India and will further penetrate deep into Tier I and Tier II cities.

7. **Support Industries-** There is various support industries which have developed because of E-Commerce. These are digital advertising, analytics, payment gateways etc... These will become billion dollars sectors as E-Commerce grows exponentially.

**VII Conclusion:** E-commerce is emerging as an important tool to ensure inclusive growth. An Emergence of internal shipping option creates the opportunities to reach online consumers around the globe. It is important for physical retailers, especially located in metro cities to make a serious effort to upgrade themselves with new technology and constantly innovate in order to delight their customers. The concept of virtual companies is taking concrete shape and will usher into an era of boundary less world. E-commerce has the scope to lead India into an Economic superpower. On the other hand E-commerce faces some challenges also which we need to work on, like lack of cyber laws & computer education. Today E commerce has become an integral part of everyday life. Accessibility to E-commerce platform is not a privilege but rather a necessity for people, particularly peoples who are staying in urban areas. Due to fast adoption of internet enabled devices like

Smartphone and Tablets, we have seen an unparalleled growth in E-commerce. The telecommunication technology has completely changed the way of our living, communication methods, shopping etc. It has a huge impact on how we communicate with friends and relatives how we travel, how we access the information and the way we buy or sell products and services. The growth of E-commerce volumes in India is attracting the attention of players around the globe. E-commerce creates new opportunities for business it also creates new opportunities for education and academics. It appears that there is tremendous potential for providing E-business education.

## STRUCTURE AND FEATURES OF GOODS AND SERVICE TAX IN INDIA

**Dr. Palwe Ajaykumar Madhukar**

*Asst. Prof. and Head, Dept. of Economics, Babuji Avhad Mahavidyalaya, Pathardi.  
Dist Ahmednagar.*

### **Abstract**

*The goods and service tax (GST) is aimed at creating a single, unified market that will benefit both corporate and the economy. The changed indirect tax system GST-Goods and service tax is planned to execute in India. Several countries implemented this tax system followed by France, the first country introduced GST. Goods and service tax is a new story of VAT which gives a widespread setoff for input tax credit and subsuming many indirect taxes from state and national level. The objective will be to maintain a commonality between the basic structure and design of the CGST, SGST and IGST between states. In this article, I have started with the introduction, in general of GST and have tried to highlight the objectives the proposed GST is trying to achieve. Thereafter, I have discussed the possible challenges and threats; and then, opportunities that GST brings us to strengthen our free market economy. This Paper is an analysis of what the impact of GST (Goods and Services Tax) will be on Indian tax Scenario. Here stated with a brief description of the historical scenario of Indian taxation and its tax structure. Then the need arose for the change in tax structure from traditional to GST model. GST has been detailed discuss in this paper as the background, salient features and the impact of GST in the present tax scenario in India. The Goods and Services Tax (GST) is a value added tax to be implemented in India, the decision on which is pending. GST is the only Indirect tax that directly affects all sectors and sections of our economy*

**Keywords:** GST, CGST, SGST, VAT, INPUT CREDIT

### **1. History of Taxation**

#### **What is Tax?**

The word tax is derived from Latin word 'taxare' meaning to estimate. A tax is not a voluntary payment or donation, but an enforced contribution, exacted pursuant to legislative authority "and is any contribution imposed by government whether under the name of toll, tribute, impost, duty, custom, excise, subsidy, aid, supply, or other name." 1 The first known system of taxation was in Ancient Egypt around 3000 BC-2800 BC in the first dynasty of the old kingdom. Records from that time show that the pharaoh would conduct a biennial tour of the kingdom, collecting tax revenues from the people. Other records are granary receipts on limestone flakes and papyrus. Early taxation is also described in the Bible. Taxes in India are levied by the Central Government and the state Governments. Some minor taxes are also levied by the local authorities such as Municipality or Local Council. The authority to levy tax is derived from the Constitution of India which allocates the power to levy various taxes between Centre and State.

### **2. OBJECTIVES OF GST :-**

One of the main objectives of GST would be to eliminate the cascading impact of taxes on production and distribution cost of goods and services. The exclusion of cascading effects i.e. tax on tax will significantly improve the competitiveness of original goods and services which leads to original goods and services which leads to beneficial impact to the GDP growth. It is felt that GST would serve a superior reason to achieve the objective of streamlining indirect tax regime in India which can remove cascading effects in supply chain till the level of final consumers only when all such above mentioned indirect taxes are completely included in GST. It is understood that alcohol, and tobacco are considered as Sin Goods, and government do not like to allow free trade on these property.

### **3. CHALLENGES:-**

**3.1 With respect to Tax Threshold:** The threshold limit for turnover above which GST would be levied will be one area which would have to be strictly looked at. First of all, the threshold limit should not be so low to bother small scale traders and service providers. It also increases the allocation of government resources for

such a petty amount of revenue which may be much more costly than the amount of revenue collected. The first impact of setting higher tax threshold would naturally lead to less revenue to the government as the margin of tax base shrinks; second it may have on such small and not so developed states which set low threshold limit under current VAT regime.

3.2 **With respect to nature of taxes:** The taxes that are generally included in GST would be excise duty, countervailing duty, cess, service tax, and state level VATs among others. Interestingly, there that would be still out of GST.

3.3 **With respect to number of enactments of statutes:** There will be two types of GST laws, one at a central level called 'Central GST (CGST)' and the other one at the state level – 'State GST (SGST)'. As there seems to be different tax rates for goods and services at the Central Level, and further division based on necessary and other property based on the need, location, geography and resources of each state.

3.4 **With respect to Rates of taxation:** It is true that a tax rate should be devised in accordance with the state's necessity of funds. Whenever states feel that they need to raise greater revenues to fund the increased expenditure, then, ideally, they should have power to decide how to increase the revenue.

3.5 **With respect to tax management and Infrastructure:** It depends on the states and the union how they are going to make GST a simple one. Success of any tax reform policy or managerial measures depends on the inherent simplifications of the system, which leads to the high conformity with the administrative measures and policies.

#### 4. OPPORTUNITIES:-

4.1 **An end to cascading effects:** This will be the major contribution of GST for the business and commerce. At present, there are different state level and central level indirect tax levies that are compulsory one after another on the supply chain till the time of its utilization.

4.2 **Growth of Revenue in States and Union:** It is expected that the introduction of GST will increase the tax base but lower down the tax rates and also remove the multiple point. This will lead to higher amount of revenue to both the states and the union.

4.3 **Reduces transaction costs and unnecessary wastages:** If government works in an efficient mode, it may be also possible that a single registration and single compliance will suffice for both SGST and CGST provided government provides effective IT infrastructure of such infrastructure of states level with the union.

4.4 **Eliminates the multiplicity of taxation:** One of the great advantages that a taxpayer can expect from GST is elimination of multiplicity of taxation. The reduction in the number of taxes applicable in a chain of transaction will help to clean up the current mess that is brought by existing indirect tax laws.

4.5 **One Point Single Tax:** Another feature that GST must hold is it should be 'One point single taxation'. This also gives a lot of comfort and confidence to the business community that they would focus on business rather than worrying about other taxation that may crop up at a later stage. This will help the business community to decide their supply chain, pricing modalities and in the long run helps the consumers being goods competitive as price will no longer be the function of tax components but function of sheer business intelligence and innovation.

4.6 **Reduces average tax burdens:** Under GST mechanism, the cost of tax that consumers have to bear will be certain, and GST would reduce the average tax burdens on the consumers.

4.7 **Reduces the corruption:** It is one of the major problems that India is overwhelmed with. We cannot expect anything substantial unless there exists a political will to root it out. This will be a step towards corruption free Indian Revenue Service.

5. **Justification of GST:-** The introduction of GST at the Central level will not only include comprehensively more indirect Central taxes and integrate goods and service taxes for the purpose of set-off relief, but may also lead to revenue gain for the Centre through widening of the dealer base by capturing value addition in the distributive trade and increased compliance. In the GST, both the cascading effects of CENVAT and service tax are removed with set-off, and a constant chain of set-off from the original producer's level is established which reduces the burden of all cascading. This is why GST is not simply VAT plus service tax but an improvement over the previous system of VAT and disjointed service tax. Moreover, with the introduction of GST, burden of Central Tax (CST) will also be removed. The GST at the State-level is, therefore, justified for-

- (a) Additional power of levy of taxation of services for the States
- (b) System of comprehensive set-off relief,

(c) Subsuming of several taxes in the GST

(d) Removal of burden of CST.

## 6. Dual GST

Dual GST means, the proposed model will have two part called

1. CGST - Central goods and service tax for levied by central Govt.

2. SGST – State goods and service tax levied by state Govt.

There would have multiple statute one CGST statute and SGST statute for every state.

## 7. Salient features of the GST model

Salient features of the proposed model are as follows:

(i) The GST shall have two components: one levied by the Centre (referred to as Central GST), and the other levied by the States (referred to as State GST). Rates for Central GST and State GST would be approved appropriately, reflecting revenue considerations and acceptability.

(ii) The Central GST and the State GST would be applicable to all transactions of goods and services made for a consideration except the exempted goods and services.

(iii) The Central GST and State GST are to be laid to the accounts of the Centre and the States individually.

(iv) Since the Central GST and State GST are to be treated individually, taxes paid against the Central GST shall be allowed to be taken as input tax credit (ITC) for the Central GST and could be utilized only against the payment of Central GST.

(v) Cross utilization of ITC between the Central GST and the State GST would not be permitted except in the case of inter-State supply of goods and services.

(vi) Ideally, the problem related to credit accumulation on account of refund of GST should be avoided by both the Centre and the States except in the cases such as exports, purchase of capital goods, input tax at higher rate than output tax etc.

(vii) To the extent feasible, uniform procedure for collection of both Central GST and State GST would be prescribed in the respective legislation for Central GST and State GST.

(viii) The states are also of the view that Composition/Compounding Scheme for the purpose of GST should have an upper ceiling on gross annual turnover and a floor tax rate with respect to gross annual turnover.

(ix) The taxpayer would need to submit periodical returns, in common format as far as possible, to both the Central GST authority and to the concerned State GST authorities.

(x) Each taxpayer would be allotted a PAN-linked taxpayer identification number with a total of 14/15 digits. This would bring the GST PAN-linked system in line with the prevailing PAN-based system for Income tax, facilitating data exchange and taxpayer compliance.

## 8. Benefits of GST

1. GST provide comprehensive and wider coverage of input credit setoff, you can use service tax credit for the payment of tax on sale of goods etc.

2. CST will be removed and need not pay. At present there is no input tax credit available for CST.

3. Many indirect taxes in state and central level included by GST, you need to pay a single GST instead of all

4. Uniformity of tax rates across the states

5. Ensure better compliance due to aggregate tax rate reduces.

6. BY reducing the tax burden the competitiveness of Indian products in international market is expected to increase and there by development of the nation.

7. Prices of goods are expected to reduce in the long run as the benefits of less tax burden would be passed on to the consumer.

**9. Applicability of CGST and SGS:** The applicability of taxes is as usual there would be a prescribed limit of annual turnover, also some goods and services are exempted under GST. Threshold for annual turnover for goods and services would be 10 lakh for SGST and threshold of CGST for goods may be 1.5 core and service would have a separate threshold that too will be appropriately high. It is assumed that aggregate total of CGST & SGST would be 20%

**10. Conclusion:-** GST is the most logical steps towards the comprehensive indirect tax reform in our country since independence. GST is livable on all supply of goods and provision of services as well combination

thereof. All sectors of economy whether the industry, business including Govt. departments and service sector shall have to bear impact of GST. All sections of economy viz, big medium, small scale units, intermediaries, importers, exporters, traders, professionals and consumers shall be directly affected by GST. One of the biggest taxation reforms in India – the Goods and Service Tax (GST) – is all set to integrate State economies and boost overall growth. GST will create a single, unified Indian market to make the economy stronger. Experts say that GST is likely to improve tax collections and Boost India's economic development by breaking tax barriers between States and integrating India through a uniform tax rate.

## **APPROACHES TO STUDY THE OPPORTUNITIES AND CHALLENGES TOWARDS E-BANKING IN INDIAN BANKING CONTEXT**

**Dr. M. A. Raffey & Mr. Adamane Santosh L.**

*Assistant Director, UGC-Human Resource Development Center, Dr. Babasaheb Ambedkar Marathwada University, Aurangabad*

*Research Student, Arts, Commerce & Science College, Sonai, Tal:- Newasa, Dist:- Ahmednagar*

### **Abstract**

*India is a developing country. Banking sector plays an important role in development of Indian Economy. It is the lifeline of an economy. In today's IT revolution Indian banking industries implementing the IT based Enabled services. E banking services has benefited the both i.e. consumers as well as banks. Today's competition era the bank has to be go in front to the increasing total banking automation in the Indian banking industry. The bank wants to introduce the core concept of IT based Enabled Services (ITES). The objective of the present paper is to study the progress made by Internet Banking in India. The present paper has focused on the need and benefits of E – banking and also discusses the challenges and opportunities of E -banking in Indian banking context.*

**Keywords:** *E-Banking, Benefits, Challenges and Opportunities, India.*

Banking sector is the life line of an economy. Growth of Indian economy depends upon the success and development of banking. Traditional banking system does not achieve the objective of economy. Today's technology development era the traditional banking system adopted IT (Information Technology). The competition among the banks has led to the increasing total banking automation in the Indian banking industry. IT has introduced new business paradigm. It is playing a significant role in improving the services in the banking industry. Indian banking industry has witnessed a tremendous developments due to sweeping changes that are taking place in the information technology. E- Banking refers to a system allowing individual customers to perform banking activities at off-bank sites such as home, office and other locations via internet based secured networks. Finland was the first country in the world to have taken a lead in E-banking. In India, ICICI bank was the first bank who initiated E-banking as early as 1997 under the brand name Infinity.

**Review of Literature:** Chawla (2009) described that the customers of public sector, private sector and foreign banks in Ludhiana district of Punjab are interested in e-banking services. He found that the same time are facing problems like inadequate knowledge, poor network, lack of infrastructure, unsuitable location, misuse of ATM cards and difficulty to open an account. Trivedi & Patel (2013) analysed the problems faced by customers while using e-banking facilities in India. It observed that most of the customers know about the e-banking services offered by their bank. The study found that there is a significant difference amongst different problems identified while using e-banking services. It also found that some problems affect more and some problems affect less in use of banking services. It concluded that all the reasons are not equally responsible for not using e-banking services Chavan (2013) described the benefits and challenges of Internet banking in an emerging economy. It observed that online banking is now replacing the traditional banking practice. It showed that online banking has a lot of benefits which add value to customers' satisfaction in terms of better quality of service offerings and at the same time enable the banks gain advantage over the competitors. It also discussed some challenges in an emerging economy.

### **OBJECTIVES OF THE STUDY**

- To understand the issue E-Banking
- To study the need and benefits of E-banking
- To study the challenges of E-Banking.
- To study the opportunities available in E-banking.

**Research methodology:-** All the data present study should have collected from a secondary source of data collection, like government reports, publications from various websites which focused on various aspects of E Banking

**E-Banking:** Delivery of banking services to customers at their office or home with the help of electronic technology is termed as e-banking. Daniel (1999) defines “electronic banking as the delivery of bank’s information and services by banks to customers via different delivery platforms that can be used with different terminal devices such as a personal computer and a mobile phone with browser or desktop software, telephone or digital television” It is a web-based service that enables the banks authorized customers to access their account information. It permits the customers to log on to the banks website with the help of banks issued identification and personal identification number (PIN). The banking system verifies the user and provides access to the requested services, the range of products and service offered by each bank on the internet differs widely in their content. The popular services covered under E-banking include: - Automated Teller Machines, Credit Cards, Debit Cards, Smart Cards, Electronic Funds Transfer (EFT) System, RTGS, Cheque truncation, Mobile Banking, Internet Banking & Telephone banking

#### **CHALLENGES IN E-BANKING**

- **Security Risk:** The problem related to the security has become one of the major concerns for banks. A large group of customers refuses to opt for e-banking facilities due to uncertainty and security concerns. According to the IMAI Report (2006), 43% of internet users are not using internet banking in India because of security concerns. So it’s a big challenge for marketers and makes consumers satisfied regarding their security concerns, which may further increase the online banking use.
- **The Trust Factor:** Trust is the biggest hurdle to online banking for most of the customers. Conventional banking is preferred by the customers because of lack of trust on the online security. They have a perception that online transaction is risky due to which frauds can take place. While using e-banking facilities lot of questions arises in the mind of customers such as: Did transaction go through? Did I push the transfer button once or twice? Trust is among the significant factors which influence the customers’ willingness to engage in a transaction with web merchants.
- **Customer Awareness:** Awareness among consumers about the e-banking facilities and procedures is still at lower side in Indian scenario. Banks are not able to disseminate proper information about the use, benefits and facility of internet banking. Less awareness of new technologies and their benefits is among one of the most ranked barrier in the development of e-banking.
- **Privacy risk:** The risk of disclosing private information & fear of identity theft is one of the major factors that inhibit the consumers while opting for internet banking services. Most of the consumers believe that using online banking services make them vulnerable to identity theft. According to the study consumers’ worry about their privacy and feel that bank may invade their privacy by utilizing their information for marketing and other secondary purposes without consent of consumers.

#### **OPPORTUNITIES IN E-BANKING**

- **Untapped Rural Markets:** Contributing to 70% of the total population in India is a largely untapped market for banking sector. In all urban areas banking services entered but only few big villages have the banks entered. So that the banks must reach in remaining all villages because majority of Indian still living in rural areas.
- **Multiple Channels:** Banks can offer so many channels to access their banking and other services such as ATM, Local branches, Telephone/mobile banking, video banking etc. to increase the banking business.
- **Worthy Customer Service:** Worthy customer services are the best brand ambassador for any bank for growing its business. Every engagement with customer is an opportunity to develop a customer faith in the bank. While increasing competition customer services has become the backbone for judging the performance of banks.
- **Internet Banking:** It is clear that online finance will pickup and there will be increasing convergence in terms of product offerings banking services, share trading, insurance, loans, based on the data warehousing and data mining technologies. Anytime anywhere banking will become common and will have to upscale, such up scaling could include banks launching separate internet banking services apart from traditional banking services.

➤ Retail Lending: Recently banks have adopted customer segmentation which has helped in customizing their product folios well. Thus retail lending has become a focus area particularly in respect of financing of consumer durables, housing, automobiles etc., Retail lending has also helped in risks dispersal and in enhancing the earnings of banks with better recovery rates.

➤ Increasing Internet Users & Computer Literacy: To use internet banking it is very important or initial requirement that people should have knowledge about internet technology so that they can easily adopt the internet banking services. The fast increasing internet users in India can be a very big opportunity and banking industry should encash this opportunity to attract more internet users to adopt internet banking services. Table shows evidence of increasing number of internet users in India.

### CONCLUSION

In India, banking sector has completely transformed due to the adoption of advanced technology like ATMs, Credit Cards, RTGS, Debit Cards, and Mobile Banking etc... Banks are making sincere efforts to popularize the e-banking services and products. The banks are facing many challenges and opportunities are available with the banks.

## DIGITAL MARKETING IN THE TOURISM INDUSTRY

**Dr. Manohar Kacharu Sanap**

Associate Professor of Commerce, Ness Wadia College of Commerce, Pune-411001

### **Abstract**

*With the advent of superior Internet technologies, newer avenues for reaching out to target audiences have evolved. Digital marketing today has become an indispensable part of every business irrespective of its size and type. The increasing role of digital marketing has affected the way businesses promote their offerings to existing as well as new customers. The need for digital marketing has been felt like never before in the tourism industry wherein customers have instant access to all kinds of information on the latest offers and best prices. Today digital marketing plays a critical role in the success of each business which exists in the tourism industry. This paper examines the basic determinants of digital marketing and the importance of the same in the tourism industry.*

**Keywords:** Digital Marketing; Internet Marketing; Tourism; Websites; SEO; Email Marketing; Social Media.

**Introduction:** With the launch of internet technology, the rules of marketing have been redefined all over the world. The internet has upended how consumers engage with brands. It is transforming the economics of marketing and making obsolete many of the function's traditional strategies and structures. For marketers, the old way of doing business is unsustainable (Edelman, 2010). Digital Marketing today has become the one of the key focus areas for businesses all over the world. It started as a mode of communication and has evolved not just into another source of additional revenue but most importantly, to develop and maintain long-term relationships with the various parties in the market. Interactivity, as the main feature of the Internet, has enabled a new dimension of connection between all the participants in the market (Batinić, 2015). Internet users today interact not just with each other but also with their preferred brands. This has opened an opportunity for brands to talk directly with their users and to know them better. One of the main reasons of the success of digital marketing vs. traditional marketing is the fact that the former allows businesses to track user behaviour in real-time. Every campaign launched digitally can be tracked in terms of its reach, engagement and conversion. This has given a whole new meaning to the marketing research to understand the needs of the customers like never before. Thus, the need to include digital marketing in the overall marketing strategy of the business shall only contribute to the better achievement of the overall marketing and business goals by enabling brands to gain insights about consumer behaviour and better satisfy their needs.

**2. Understanding Digital Marketing:** After reviewing the several literatures available on the subject, the meaning of digital marketing can be understood better.

- Internet marketing and online advertising, also called e-marketing, web marketing, online marketing, or e-marketing, is the advertising of products and services over the Internet. (Ruzic, D. 2003).
- The application of the Internet and related digital technologies in conjunction with traditional communications to achieve marketing objectives. (Chaffey, 2012).
- Internet marketing is the use of the Internet and other digital technologies with traditional methods in order to achieve marketing goals. Marketing using electronic media such as the web, email, interactive TV, IPTV and wireless media in conjunction with digital data about customers characteristics and behaviors. (Chaffey, D., Ellis-Chadwick, F., Mayer, R., Johnston, K. 2009).
- Internet Marketing (also known as e-Marketing, Web Marketing, or Digital Marketing) is an all-inclusive term for marketing products and/or services online—and like many all-inclusive terms, internet marketing means different things to different people. (Ward, 2016).
- Digital marketing, the promotion of products or brands via one or more forms of electronic media, differs from traditional marketing in that it uses channels and methods that enable an organization to analyze marketing campaigns and understand what is working and what isn't – typically in real time. (Source: sas.com).

Traditional Marketing involves collecting data through the process of market research and then analyzing the same to help understand the audiences better. The digital nature of the Internet technology provides a comprehensive and detailed insight into the characteristics of consumers and their behaviour in the electronic environment. (Batinić, 2015) This information has transformed the way business decisions are being made. The impact of each and every marketing initiative can be studied in real-time along with being customized for each and every customer.

### 3. Objectives of the Study:

The major objectives of the present study are to:

- To understand the concept of digital marketing
- To examine the characteristics of a successful digital marketing campaign
- To analyze the role of digital marketing in today's tourism industry

### 4. Characteristics of a Successful Digital Marketing Campaign:

Post understanding what digital marketing is all about, it is also important to understand the top six characteristics of successful digital marketing campaigns:

**Quality Website:** A quality website today is a prerequisite before establishing a business online. It not only helps your business transcend geographical boundaries to reach newer prospects, but also work as digital destinations for your audiences who can access it 24x7!

**Strong Social Media presence:** Social Media platforms like Facebook, Twitter, LinkedIn, Instagram enable businesses to reach out and talk directly to their users. Presence on these platforms not only helps brands to establish credibility, improve customer services but also provides insights on what your customers are up to.

**Search Engine Optimization:** SEO is an integral part of digital marketing today. The online ranking of a business on various search engines determines the online popularity and helps increase website visits. There is a lot of misconception that SEO efforts would lead to immediate results. It is important to understand that SEO is an ongoing process and takes time to show results. Businesses need to ensure that a dedicated team works on ensuring that both on-page and off-page SEO initiatives are undertaken.

**Email Marketing:** Email Marketing isn't all about bombarding the inbox of your audiences with emails. It needs to be planned and executed well to ensure maximum returns. Sending personalized emails to users increases the chances of getting instant replies along with showing that a business cares. Customize offers and communication for various user groups based on where they lie in your business relationship cycle.

**Engaging Content:** Content used across various online platforms should lead to increased engagement rates. Businesses need to ensure that they post relevant content across various platforms at the right time. Blogging is an excellent way to engage with audiences and move beyond than just selling products.

**Mobile-Friendly:** Everything that a business does digitally today should be mobile friendly. Majority of online users today access the internet on their mobile phones and this should reflect in every aspect of online marketing considerations.

**5. Digital Marketing and Tourism Industry:** The tourism industry includes all the people, activities, and organizations involved in providing services for people on holiday, for example hotels, restaurants, and tour guides. Before the launch of digital marketing, the role of people who rendered these services was indispensable to the success of the business. With the launch of the internet, newer modes of marketing the various services to the target audiences have evolved. The tourism industry, in particular, has been disrupted as a whole with the rapid development of the internet. Users purchase services related to tourism online at the click of a button while comparing amongst businesses from all over the world. In order to compete and succeed digitally, the most relevant digital marketing activities include:

**Quality Website:** 'Marketing experts must come up with attractive websites, find a way to attract customers to visit the web site, keep them there for a while and make them frequently come back to their website.' (Kotler, P., Bowen, T. John., Makens, C. James 2010). This is especially true for businesses which are only present online like the tourism industry. Websites work as digital destinations for the audiences wherein a business can define their brand's experience. It is very important to keep the website content concise and ensure that the USPs are clearly visible. A good website should have all the services clearly listed down along with the relevant information. Adding high-resolution images of various services being offered like hotel rooms, spa etc. will enable the users to take an informed decision. Users tend to read webpage as compartmentalized chunks of

information by swiping their eyes from left to right, and then continue on down the page in an F-shaped pattern, skipping a lot of text in between. The best strategy is to break up long articles into sections so that users can easily skim down the page. It is also important to ensure that there is enough breathing space around the various images, texts and buttons on the website. Adequate spacing between elements on a page allows for a more enjoyable reading experience and allows time to focus on the individual pieces of a page without being overwhelmed by everything else around it. A lot of websites open the price lists, menus and packages in a new window to avoid disrupting the current experience of the users. The website must be built in a way that it allows the users to make a purchase without the need of any kind of assistance. It must be updated regularly keeping in view the changing customers' needs and preferences. The navigation tab should have a clear option for deals/packages to avoid an increase in the bounce rate. A good website represents the quality the business stands for and thus it should be developed and maintained keeping in mind the functionality of the industry.

**Strong Social Media Presence:** Social Media is a new marketing tool that allows you to get to know your customers and prospects in ways that were previously not possible. This information and knowledge must be paid for with output of respect, trustworthiness, and honesty (Marjorie Clayman). The most relevant social media platforms for a tourism business include the following:

- Facebook
- Instagram
- Twitter
- LinkedIn
- YouTube

Presence on these platforms is not just about promoting the latest packages and facilities; it is much more than that. A user will not avail the services on a daily basis so it is essential that a business becomes a part of the conversation users are having on these platforms. Focusing on posting content which adds value to the audiences' lives will help improve the engagement rate. Ixigo uploaded a simple video of travel hacks and it proved to be one of the most successful digital marketing campaigns of that year. Lastly, a brand shouldn't consider all these platforms as one. Each of them comes with its own set of USPs. Facebook and Instagram should be the top two platforms a tourism business.

**Search Engine Optimization:** SEO plays a very important role in determining the website traffic. The businesses need to ensure that equal attention is paid to both on-page and off-page SEO activities. Use of 'Keyword Planner' to find the most relevant keywords for the tourism business is the first step towards effective SEO. Google, the biggest search engine, understands synonyms so keywords must be carefully chosen. The focus should be on creating quality backlinks rather than just increasing their numbers. Usage of long-tailed keywords such as 'best holiday package India' shall lead to more conversions rather than short-tailed keywords.

**Email Marketing:** 'The use of email marketing creates the opportunity to offer any potential interested guest to arrive at the right time at the minimum cost, and the results of such activities must be measurable, which creates a basis for decisions on future marketing activities.' (Kotler, P., Koller, K.L. 2008). Email Marketing enables users to know about the latest offers by the hotels, special deals on holiday packages, membership clubs, room availability and so much more. Transactional emails are sent to users to keep them updated about the status of their bookings. Emails are also a very good way of keeping the relationship going with the customers post the transaction has been completed. Special mailers are sent to customers on their birthdays and anniversaries by offering a special price on the services. This provides an incentive to the customers to make a purchase while visiting the competitors.

**Content:** Content is the essence of digital marketing. Good quality content must be engaging and add value to the everyday lives of the audiences. According to socialmedia.com, "There's no secret formula to successfully engaging with your audience on social media, but applying 'The 80/20 Rule' should always be a big part of your social media strategy. It simply comes down to this: use just 20% of your content to promote your brand, and dedicate 80% to content that really interests your audience and engages them in conversations." In the tourism industry, videos and info graphics are an interactive content type to get noticed and engage the users.

**Mobile-Friendly:** There are 6.8 billion people on the planet; only 3.5 billion use a toothbrush, whilst 4 billion of them own a mobile phone, most of which are smartphones (Hub spot). The website, app, updates on social

media, emails, SEO or any other aspect of digital marketing, being mobile-friendly is a prerequisite in today's times.

**6. Conclusion:** Digital Marketing today is all about using the internet technologies to reach out to existing and newer audiences and engage with them. Today digital marketing has disrupted industries and changed the way businesses reached out to customers. The main difference between traditional and digital marketing is the latter's ability to track data about user behaviour and campaign performance in real-time. In the tourism industry, the disruption was felt few years ago and has transformed the way businesses reach out to users. For any business to be successful digitally in the tourism industry, the above mentioned six points- quality website, SEO, Email marketing, Presence on social media, content, mobile-friendly play a very crucial role.

## **DETERMINANTS OF ORGANIZATIONAL COMMITMENT OF GENERATION Y EMPLOYEES IN B.P.O. SECTOR IN INDIAN WITH SPECIAL REFERENCE TO PUNE CITY**

**Prof. Yogesh N. Shrikhande**

*Head of the Department - Commerce faculty, Amruteshwar Arts, Commerce & Science College, Vinzar*

### **Abstract**

*There is a revolutionary change in the world of work of BPO industry. Widespread growth and development of BPO industry worldwide created many new opportunities and jobs. This growth and fast development of new opportunities in BPO sector has given birth to the problem like increase in job hopping and turnover and changes in organizational commitment.*

### **RESEARCH PROBLEM**

**Turnover of valuable employees can result in various problems like** Interruption in normal operations, Increased replacement and recruitment costs, Loss of efficiency & incomplete projects, Customer dissatisfaction, Scheduling difficulties, Depletion of company's intellectual capital etc. Therefore, it is necessary to study the important determinants of organizational commitment.

**IMPORTANCE OF THE STUDY:** This study has theoretical as well as practical importance. Theoretically it has open new dimension for retention theories of valuable current employees and practically, with the help of this study the B.P.O. companies are able to know which determinants of organizational commitment are most valued by the generation Y employees in their company.

### **OBJECTIVES**

- 1) To study two determinants of organizational commitment i.e. Job Characteristics and work life balance for the Generation Y employees of B.P.O. industry in Pune City.
- 2) To study effects of these determinants of organizational commitment on Generation Y employees of B.P.O. industry in Pune City.
- 3) To suggest the remedies for retention of B.P.O. professionals.

### **RESEARCH METHODOLOGY**

#### **A] Primary Data :**

##### **Universe, Sample size and sampling Technique**

**Stratified random sampling** has been applied as a sampling technique. Out of total BPO companies in group of political wards for Pune Municipal Corporation in Pune city, 10 % companies with turnover above 10 crore are selected. BPO Companies do not disclose exact number of employees on their website due to confidentiality and due to high attrition rate number of employees goes on chanting. Researcher has to rely upon the data given by respondent. Therefore, standard sample size for infinite population i.e. 385 is decided<sup>1</sup>

#### **B] Secondary Data:**

Secondary data has been collected from the published literature such as

1. Reference books
2. Journals of Reputes
3. News papers etc.

The government reports, Websites also will be used for obtaining secondary data.

### **TESTING OF HYPOTHESIS**

---

Sr. no.	Hypothesis	Hypothesis testing	Result of Hypothesis testing
1	<p><b>H<sub>0</sub></b> : Organizational Commitment is not correlated with job characteristics and work life balance policies of generation Y employees in B.P.O. sector in Pune city.</p> <p><b>H<sub>1</sub></b>:- Organizational commitment is positively correlated with Job characteristics and work life balance of generation Y employees in B.P.O. sector in Pune City.</p>	<p>Correlation coefficient between O. C. and job characteristics= 0.6454 O.C. and work life balance = 0.5260 Which are less than 0.8 but greater than 0.5 hence, it is interpreted that correlation does exist between O. C. and job characteristics as well as O. C. and work life balance.</p> <p><b>As correlation coefficient is less than 0.8 hence, correlation does exist but it is not strong correlation.</b></p>	<p>Hence, “<b>Researcher fails to accept H<sub>0</sub> and hence H<sub>1</sub> is ‘Accepted’</b>”</p>

### FINDINGS

- 1) Researcher found that 50.85% of the employees are agreeing that their job in BPO does not require complex and high level skills to perform day to day work. With existing qualities and qualifications employees can switch over jobs easily especially back office jobs. These employees found to be less committed to the organization.
- 2) Researcher observed 57.26% of the employees are agreeing that their job does not carry great value for their personal initiative or judgment in regular work. It depicts these employees are having less commitment to the organization.
- 3) Researcher found that 64.53% of the employees are agreeing that their job is complicated but repetitive in nature. Regular set systems and procedure to be followed in day to day work. It depicts that these employees are having less commitment to the organization.
- 4) Researcher observed that the work in 60.78% of the B.P.O. employees are predetermined and standardized by the set procedure. BPO employees are not independent to do the work as per their own wish but the client's requirement, demand and his need is the final criteria for completing the work. It depicts that these employees are having less commitment to the organization as the work become monotonous over the period of time.
- 5) Researcher found that the 55.19% of the employees are agreeing that the work schedule is often in conflict with personal life. Therefore, these employees show less organizational commitment towards organization.
- 6) Researcher found that the 57.05% of the employees are agreeing that the job has negative effect on personal life. It depicts that these BPO employees strongly believe that their personal life is badly affected by their job in BPO. Therefore, these employees show less organizational commitment towards organization.

### SUGGESTIONS

- 1) Researcher suggests that work life balance policies should be made as official policies for the BPO companies. Especially, for employees working in shifts and under pressure of targets. Companies can arrange family councilors for the needy staff. Stress management therapies, Yoga and meditation should be made compulsory for all the staff.
- 2) Researcher suggests that the promotion should be linked with the performance in terms of perfection, timeliness, response time, output etc. The practice to be set and confidence to be given to all the employees that positive performance is always recognized and rewarded with promotions. Criteria for positive performance should be known to everybody which builds healthy competition. BPO companies need to taken genuine interest in career development of an employee to gain committed employee.
- 3) Researcher suggests that special attention to be given to make fun filled environment in the BPO companies. As work itself is not interesting and enjoyable. Companies should pay attention towards creating fun rooms, creative fun games, relaxation rooms and performing arts like dance and drama and management games etc.

## GOODS AND SERVICE TAX: A GENERAL VIEW

Prof. Rahane shobha & Prof. Dr. kadam Pramodini

<sup>1</sup>Ph.D Research Student, Post Graduate Research Center in economics

<sup>2</sup>Guide & Assistant Professor, S.M.B.S.T.College, Sangamner, Dist-Ahmednagar, State- Maharashtra

### Abstract

The Goods & Service Tax is a value added tax to be implemented in India the decision on which is pending. GST is the only indirect tax that directly affects all sectors and sections of our economy. Ignorance of law is no excuse but is liable to penal provisions hence why not start learning. GST and avoid the cost of ignorance the changed indirect tax system. GST is planned to execute in India several countries implemented this tax system followed by France in 1954 the first country introduced GST. Worldwide almost 150 countries have introduced GST in one or the other form since now most of the countries have a unified GST system. The GST Implementation is not yet declared by government and the drafting of GST law is still under process and a clear picture will be available only after announcement of implementation. GST brings before us to strength our free market economy.

**Keywords**– GST, History of GST, CGST, SGST, IGST, Benefits of GST, Disadvantage of GST.

**Introduction**:- GST is an Indirect tax which was introduced in India on 1 July 2017 and was applicable throughout India which replaced multiple cascading taxes levied by the central and state governments It was introduced as the constitution Act 2017. GST Law in India is a comprehensive multi stage destination based tax that is levied on every value addition. In simple words goods and services GST law has replaced much indirect tax law that previously existed in India.

**GST Definition**:- “The goods and services Tax is a value added tax levied on most goods value added tax levied on most good and services sold for domestic consumption.”

**History of GST** :- The reform process of India’s Indirect tax regime was started in 1986 by “vishwanath pratap sing” finance Minister in Rajiv Gandhi’s government with the Introduction of the modified value Added Tax.

\*1991-Report of the chelliah committee recommends VAT/GST and recommendations accepted by Government.

\*1994-Introduction of service tax.

\*1999- Formation of empowered committee on state VAT

\*2003-VAT implemental in Haryana in April 2003.

\*2004-Significant progress towards CENVAT.

\*2005-06-VAT implemented in 26 more states.

\*2007-First GST stuffy released By Mr. P. Shome in January.

\*2007-finance ministry Announces for GST in budget Speech.

\*2007-GST phase out starts in April 2007.

\*2007-Joint working Group formed and report submitted.

\*2008-EC finalizes the view on GST structure in April 2008.

### Indirect Taxes Included under GST:-

1) **State taxes**:- VAT sales tax, Luxury tax, Entertainment tax, taxes on lottery, state Cusses & surcharges in so far as they relate to supply of goods & services, Purchase tax.

2. **Central Taxes**:- Central Excise duty, Additional Excise Duty, the Excise Duty levied under the medical and Toiletries Preparation Act, service tax, Additional customs duty commonly known as countervailing Duty, special Additional Duty of customs, surcharges, Cusses the above taxes dissolve under GST, instead only CGST & SGST exists.

### What are the components of GST:-

1. **CGST**- Collected by the central Government on an intra-state sale.

2. **SGST**-Collected by the state Government on an intra-state sale.

**3.IGST:-**Collected by the central Government for inter-state sale (eg. Maharashtra to Tamil Nadu.)

**Benefits of GST:-**

**For business and Industry:-**

2. uniformity of tax rates & structure
3. Removal of Cascading

1. Easy compliance

**For the central & State Governments:-**

2. Better controls on leakage
3. Higher Revenue efficiency

1. Simple and easy to administration

**For the consumer:-**

- 1) Relief in over fall tax burden

1) single and transparent tax proportionate to the

**Other effect:-**

- 2) Boosting of Revenue
- 3) Lesser cost of Logistics and Inventory
- 4) Quite an Investment Boost

1) Simplicity at it's Best

**Disadvantage of GST:-**

1. Some economist says that GST in India would impact negatively on the real estate market. It would add up to 8 percent to the cost of new homes and reduce demand by about 12 percent.
2. Some expert's say's that CGST, SGST are nothing but new names for central excise / service tax.VAT & GST.
3. Some retail products currently have only four percent tax on them after GST garment and clothes could become more expensive.
4. Adoption and migration to the new GST system would involve teething troubles and learning for the entire eco system.

**Conclusion:-** GST is the most logical steps towards the comprehensive indirect tax reform in our country since independence. GST is livable on all supply of goods and provision of services as well combination thereof all sectors of economy whether the industry business including Govt. department and service sector shall have to bear impact of GST. All sections of economy viz, big medium, small scale units, intermediaries importers, exporters, traders, professionals and consumers shall be directly affected of GST. One of the biggest taxation reforms in India...the good & service tax...is all set to integrate state economies and boost overall growth.

## **BITCOINS – PROS & CONS**

**Dr. Sanap Gorakshnath Kacharu**

*Sanamner College, Sangamner*

### **Introduction:**

Historically, exchanges of value – barter systems – were done face-to-face so that participants could instantly verify the respective physical properties being exchanged. As purchasers and sellers became geographically distant, agents or trusted third-parties acting on behalf of the participants became necessary to verify the quantity or quality of the property being transferred. For example, credit card issuers are examples of a third-party standing in for a buyer, guaranteeing to the seller that the buyer's funds are good. The growth of the Internet and the proliferation of digital transactions have exposed many limitations to traditional currencies and exchange systems in the borderless, electronic world. Current limitations include high expenses, time delays, and security risks. These limitations are particularly egregious when the transactions involve parties on each side of the globe, different national currencies, and complex products. The idea of an international currency – independent of a country or central bank and designed for a globalized economy – has fascinated economists, business executives, computer experts, and anti-government advocates for years. The ideal currency would provide anonymity to its holders, protection from inflation, and security from theft and fraud. These ideals led to the concept of a digital currency, enabling the concept of cash or cash equivalent to be used over the Internet. Bitcoins (BTC), the latest and most popular outcome of efforts to create a practical digital currency, first appeared in 2009 with an initial issue of 2,625,000. As of December 7, 2013, there were 12,091,050 BTCs, each with a value of \$736.61 USD. The website Shopify recently listed 75 specialty retailers that accept bitcoins, and Forbes announced its "Top 10 Bitcoin Merchant Sites," including website development software developer Word Press. Even Baidu, Inc., China's biggest search engine, accepted bitcoins until the nation's central bank banned the use or ownership of the currency by financial institutions.

**Description of Bitcoins:** Bitcoin payments are processed through a private network of computers linked through a shared program. Each transaction is Bitcoin is a decentralized, peer-to-peer, "cryptocurrency" system designed to allow online users to process transactions through digital units of exchange called Bitcoins. Started in 2009 by a mysterious programmer, Bitcoin has generated plenty of interest and controversy as a "third" type of currency and an alternative to government fiat currencies like the U.S. dollar or the euro or pure commodity currencies like gold or silver coins. Simultaneously recorded in a "blockchain" on each computer that updates and informs all accounts. Bitcoins are either "mined" by a computer through a process of solving increasingly complex mathematical algorithms or purchased with standard national money currencies and placed into a "Bitcoin wallet" that is accessed through a smartphone or computer. According to Anthony Gallippi, CEO of Bitpay payment processor, "Bitcoin is a more secure, faster, and more affordable option for transferring funds." In technical terms, bitcoins are a math-based, finite, verifiable, open-sourced, decentralized virtual currency that relies upon cryptography for security.

Proponents of the new currency claim that:

- Instant payment can be made to anyone, anywhere in the world
- Transactions cannot be reversed for any reason
- Third parties are unnecessary
- The supply of bitcoins cannot be manipulated by any government, bank, organization, or individual

**Mining:** Bitcoins are created in blocks of 50 bitcoins through a process called "mining" – what amounts to a payment for services provided to the decentralized network by processing transactions. In layman's language, a transaction – one party transferring bitcoins to a second party – occurs electronically between each party's bitcoin "wallet" – the name for the public digital files where the respective parties, or wallet owners, keep private encryption keys to prove ownership of the wallet. The transactions are processed by network computers (bitcoin miners) into a shared public ledger called a "block chain." The block chain is maintained over the entire

network according to specific cryptographic rules, and each transaction must be verified by other computers (nodes) in the network before it's confirmed. Once the network computers (the "miners") complete the increasingly complex algorithms associated with each transaction, the owners of the mining computers earn a fixed number of bitcoins.

Essentially, the bitcoin transaction is audited a minimum of six times by different computers in the network before the transfer is confirmed to the wallet owners. This ensures that:

1. The transferring bitcoin wallet has sufficient bitcoins to complete the transaction.
2. The appropriate number of bitcoins are transferred from one wallet to the other, thus agreeing and confirming the total number of bitcoins outstanding remains the same.
3. The bitcoin balance in each wallet is correct following the transfer, again confirming that the total outstanding bitcoins are correct.

Each computer verifying the transaction adds its own sequence of numbers to the block chain. As transactions increase, the computing power necessary to complete each transaction also increases due to the longer block chain and the greater complexity of the algorithms required to complete each operation.

Mining – processing transactions for the bitcoin network – is the only method by which new bitcoins are created. As the number of outstanding (unissued) bitcoins decrease, and the number of bitcoin transactions increase, the bitcoin miner must expend greater computer power to complete each transaction. This is the planned consequence of fixing the number of bitcoins issued to 21,000,000 BTC, thereby establishing the rate at which future BTC blocks are issued on a declining ratio based on the number of outstanding BTCs.

For instance, once there are 17,718,750 BTC outstanding, 6.25 BTC/block will be issued relative to the 50 BTC/block initially issued. According to Virtual Mining Corp CEO Kenneth Slaughter, "In 2009, people could mine 50 coins every 10 minutes. By the end of 2012, that amount was halved to 25 coins."

**The Potential of Bitcoins:** While the number of bitcoins and their value has increased since their introduction, it may be helpful to compare bitcoins to other electronic payment methods.

**Transaction Volumes:** In the fiscal year ending October 2013, there were \$8 billion in transactions in bitcoins. By contrast, Bank of America, PayPal, Western Union, Automated Clearing House (ACH) Network, and Fedwire collectively processed 132 million transactions for a total of \$599 trillion in 2012, as testified to by Jennifer Shasky Clavery of the United States Department of Treasury in November 2013.

**Transaction Capacity:** Gallippi, also testifying before the Senate Banking Subcommittee at the same time as Clavery, contrasted the difference between the existing capacity of processors to handle bitcoin transactions as compared to credit card processing. He noted that the Visa credit card network can handle 20,000 transactions per second worldwide, while Bitcoin has the capacity to handle seven transactions per second, and currently averages just one transaction per second. He also stated that the global money supply of bitcoins is around \$5 billion today, compared to \$70 trillion in the global M2 money supply.

**Pros of Bitcoins:** Due to the unique nature of virtual currencies, there are some inherent advantages to transacting through Bitcoin that users of other currencies do not get. Digital currencies are a relatively new and untested medium of exchange, and users should be careful to weigh their benefits and risks. That said, Bitcoin appears to offer some unique possibilities.

Bitcoins have a way to go before becoming a serious alternative to existing electronic transaction systems, but they do provide real advantages to users:

1. **Protection From Payment Fraud:** Bitcoins are digital and cannot be counterfeited or reversed arbitrarily by the sender, as with credit card charge-backs.
2. **Reduced Possibility of Identity Theft:** When you give your credit card to a merchant, you give him or her access to your full credit line, even if the transaction is for a small amount. Credit cards operate on a "pull" basis, where the store initiates the payment and pulls the designated amount from your account. Bitcoins use a "push" mechanism that allows the bitcoin holder to send exactly what he or she wants to the merchant or recipient with no further information. Furthermore, bitcoins do not require names – just digital wallet IDs.
3. **Direct Transfers for Immediate Settlement:** Purchasing real property typically involves a number of third parties, delays, and payment of fees. In many ways, the bitcoin block chain is like a "large property rights database," says Gallippi. Bitcoin contracts can be designed and enforced to eliminate or add third party

approvals, reference external facts, or be completed at a future date or time for a fraction of the expense and time required to complete traditional asset transfers.

4. **Access to Historically Inaccessible Markets:** There are approximately 2.2 billion individuals with access to the Internet or mobile phones who don't currently have access to traditional exchange systems. These individuals are primed for the bitcoin market. Kenya's M-PESA system, a mobile phone-based money transfer and micros financing service recently announced a bitcoin device, with one in three Kenyans now owning a bitcoin wallet.

5. **Lower Fees:** There aren't usually transaction fees for bitcoin exchanges because the bitcoin miner is compensated by the network with newly issued bitcoins. Even though there's no bitcoin transaction fee, many observers expect that most users will engage a third-party service, such as Coinbase, in lieu of creating and maintaining their own bitcoin wallets. These services act like Paypal does for cash or credit card users, providing the online exchange system for bitcoin, and as such, they're likely to charge fees. It's interesting to note that Paypal does not accept or transfer bitcoins.

6. **User Anonymity:** Bitcoin purchases are discrete. Unless a user voluntarily publishes his Bitcoin transactions, his purchases are never associated with his personal identity, much like cash-only purchases, and cannot be traced back to him. In fact, the anonymous Bitcoin address that is generated for user purchases changes with each transaction.

7. **No Third-party Interruptions:** One of the most widely publicized benefits of Bitcoin is that governments, banks and other financial intermediaries have no way to interrupt user transactions or place freezes on Bitcoin accounts. The system is purely peer-to-peer; users experience a greater degree of freedom than with national currencies.

8. **Purchases Are Not Taxed:** Since there is no way for third parties to identify, track or intercept transactions that are denominated in Bitcoins, one of the major advantages of Bitcoin is that sales taxes are not added onto any purchases.

9. **Mobile Payments:** Like with many online payment systems, Bitcoin users can pay for their coins anywhere they have Internet access. This means that purchasers never have to travel to a bank or a store to buy a product. However, unlike online payments made with U.S. bank accounts or credit cards, personal information is not necessary to complete any transaction.

**Cons of Bitcoins:** Critics of bitcoins range from noted economist and "New York Times" writer Paul Krugman, to MarketWatch's David Weidner, who claims advocates for bitcoins are essentially gold bugs: "The most paranoid class of investors. They're hoarding it to ward off what they believe is hyper inflation. They don't trust the Fed. They don't trust the government. They don't trust central banks."

They, and others, raise a number of concerns, some of which are substantial obstacles to the online currency, while others may resolve as the system matures.

1. **Financing Illegal and Immoral Activities:** Some believe the appeal of bitcoin is that it can be used anonymously for illegal or antisocial acts. According to Mercedes Kelley Tunstall of Ballard Spahr LLP, "Bitcoin has built its reputation and structured its virtual currency around being both anti-government and anti-establishment." On October 2, 2013, the FBI closed the notorious website Silk Road, seizing more than 144,000 BTC worth \$28 million. According to Paul Smocer, president of BITS (the technology policy division of The Financial Services Roundtable), Silk Road was "an operation that was allegedly used to anonymously buy or sell drugs, offer guns or assassins for sale, and provide tutorials for hacking ATM machines. The operation was completely reliant on digital currency for transactions." He went on to say, "Digital currencies are being used to assist a broad array of criminal activities including illegal drug sales, stolen identities, child pornography, prostitution, human trafficking, and illegal weapons sales. It is also being used as a favorite of cyber criminals to pay for services such as developing and distributing malicious software to the movement of stolen funds resulting from account takeovers." Proponents of bitcoins, with the agreement of federal currency regulators and enforcement officials, respond that any financial institution, payment system, or medium of exchange has the potential to be used for money laundering and other illicit activities.

2. **High Risk of Loss:** Timothy B. Lee, adjunct scholar at the Cato Institute and regular contributor to Forbes.com, identifies four reasons to be cautious about bitcoins:

**Lack of Security.** There is no safety net or perfect way to protect your bitcoins from human error (passwords), technical glitches (hard drive failures, malware), or fiduciary fraud. According to an article in the UK edition of Wired, 18 of 40 web-based businesses offering to exchange bitcoins into other fiat currencies have gone out of business, with only six exchanges reimbursing their customers. The authors of the study estimate that the median lifespan of any bitcoin exchange is 381 days, with a 29.9% chance that a new exchange will close within a year of opening.

**Increased Regulation.** While relatively benign guidelines are currently in place, law enforcement agencies could decide that bitcoins are a “giant money laundering scheme,” and enact more stringent regulations that would diminish the currency’s value.

**Limited Scaling.** The design of the system limits the speed and number of transactions processed, making it unlikely that bitcoins will replace conventional credit card transactions.

**Lack of Applications.** While acknowledging bitcoins’ popular use for illegal transactions, Lee questions how useful bitcoins really are. To be truly disruptive to existing fiat currencies or electronic payment systems, Bitcoin would need applications for low-cost international money transfers, the creation of complex electronic contracts, or use in Kickstarter-style fundraising campaigns or micropayment transfers.

James J. Angel, associate professor of finance at the McDonough School of Business at Georgetown University, noted in an article on CNN that one of the largest Bitcoin exchanges is a former online site to trade cards used in the popular card game MAGIC: “An exchange based on trading kiddy cards does not seem like a sound foundation for a monetary system.”

Many financial experts would concur that the issues inherent in currency and monetary exchange systems are considerably more complex than the artificial limits established in game software. Angel also predicted that Bitcoin mining software would become a magnet for computer viruses since there is no government regulating the participants within the system.

On December 8, 2013, the Financial Times reported that “Bitcoin has fueled a surge in the number of cyber-attacks,” with more than 300,000 known incidents occurring in the preceding quarter. According to the article, cyber-attackers demand ransoms paid in bitcoins from owners of the computers that have been attacked, steal bitcoins by deciphering the long codes, and hack the coining computers used to maintain the public ledger of bitcoin ownership.

Furthermore, Mr. Smocer, testifying before the Senate Subcommittee, noted that bitcoins are not broadly accepted by the established financial services industry, limiting their overall application and use.

**3. Excessive Volatility:** According to an analysis published in The Wall Street Journal by Campbell Harvey, a finance professor at Duke University, bitcoins have been 7.5 times as volatile as gold, and more than eight times as volatile as the S&P 500 over the last three years. This coincides with the analysis of Marie Brière, associate professor of Université Paris Dauphine in France, who calculated an annualized return of 370% for bitcoins with 175% volatility. Such violent price movements within short time periods are not consistent with an ideal exchange medium for buyers or sellers, limiting bitcoins as a significant vehicle for businesses. Many believe that bitcoins are speculative bubbles, similar to the Dutch tulip bulb mania of the 1600s. The evidence to date definitely suggests that the current market is mainly speculation, with three-quarters of mined bitcoins being hoarded, waiting for prices to rise.

**Conclusion:** There you have it folks. With this, you now have both sides of the coin. Bitcoin, as you can see, is not perfect. It does have many advantages that physical currencies do not provide its users; however, it also has its disadvantages. This is mostly due to the fact that Bitcoin is still a relatively young and new currency. People are just beginning to become more aware of it. In order for Bitcoin to succeed, more people need to understand what it is and not let their preconceived notions distort the concept of digital currencies. There are always pros and cons to any situation in life. To be able to make a good decision, you need to weigh the good and bad thoroughly before finalizing your choice. Do the same for Bitcoin. Understand what it is, and decide what you want to do with it. We, at Coinreport give you the facts; you are the ones who make your decision.

## IMPACT OF GLOBALIZATION ON PRIVATE SECTOR BANKS IN NASIK DISTRICT

**Dr. Kadam Asha Dadasaheb**

Dept of Commerce, MVP's KPG College, Igatpuri

### **Abstract**

Growing importance of services sector is the main feature of Indian Economic Development. In India the growth of service sector is more than the development of Agriculture and Industries. In GDP of India the share of service sector is more than other sectors and it is also involved in the state level development.<sup>1</sup> Service sector have nearby 60 per cent share in the GDP of the country. Services sector has created more employment opportunities and more income sources from the decade 1990 and it also developing with the growing rate of 9 per cent per annum.<sup>2</sup> According to the budget of 11<sup>th</sup> Five year plan, GDP will be increase at 8 to 9 per cent. In the past period of 20<sup>th</sup> century many banks have provided Banking Services to its customers and in 21<sup>st</sup> century nearby 97% Banks are providing banking services to its customers. Such as ATM, Debit/Credit Cards, Phone Banking, Internet Banking etc. Many customers have no idea about using the New Technologies of Banks so it becomes necessary to know how far the customers know about these Techniques. Many customers are using the services but are also facing the problems due to Inadequate Installation of Technology and in some areas the services are not provided by the banks<sup>3</sup>. The researcher attempts the problems of bank employees as well as bank customers towards using the techno-based services in banks.

**Key words:** Techno-based, Indian Economy, RBI, BOS

**Introduction:** In recent times, banking services play an important role in the Indian Economy. Nasik is also served by Banks for rendering various services to its customers. Banking services studied are: ATM, Debit/Credit Cards, Phone Banking, Internet Banking and other allied services. Use of these services requires computer awareness and literacy on the part of users and therefore, spread of these services among the masses is rather slow<sup>4</sup>. It was assumed that use of these services among farmers and rural based small businessmen might be less as compared to urban elite. To verify whether this assumption is true, this study was undertaken. This chapter presents summary of the work done so far, findings of the work, hypotheses testing.

### **Objectives of the study:**

1. To know the response of the customers to selected e-banking services such as ATM, Debit/Credit cards, phone banking, Internet Banking etc.
2. To study the difficulties (if any) faced by the customers in urban and rural area in using e-banking services offered by Banks.
3. To suggest ways and means to improve the customer services offered by Banks in the context of e-banking.

**Research Methodology:** The entire study is based on Primary as well as Secondary data. The Secondary data is collected from the reports of RBI, Annual Reports of the banks, Journals, Magazines, E-journals, Periodicals, Newspapers, etc. The Primary data is collected through structured questionnaire and filled up from the Bank employees and customers of sample banks. The customers who are using techno-based services of the banks are considered for the research work. The purposive sampling method is used for selection of banks and simple random sampling method is used for customers.

### **Findings**

Following are the major findings of the study:

1. Users of techno-services of banks are marginally higher than non-user customers among the youngest age-group of < 25 years and significantly higher in the middle aged group than non-users. However, the number and relative share of non-users among senior citizen is significantly higher than users of these services. Large number of non-user customers has less knowledge and they afraid for using the services due to lack of knowledge and less education towards the techno-services.

2. It is observed that Axis bank is not found in the rural industrial area, but it is found in urban industrial area where financial transactions are comparatively more than the rural area. There is no branch of HDFC bank in rural tribal area, but it is working in the urban tribal area. It is also observed that there is only a single bank that is ICICI Bank which is working all over in urban as well as in rural areas.

3. It is observed that almost all the users of technological services 160 (100 per cent) customers are using ATM services.

4. 110 (68.75 per cent) customers are using Debit/Credit Card service, 113(70.63 per cent) customers are using Phone Banking service, 50 (31.25 per cent) customers are using Internet Services and 115 (71.87 per cent) customers are using other technological services such as E-payment service, shared payment network service, PC Banking, Home banking, mobile banking service, core banking service, money transfer service etc. It means majority of customers are using ATM services provided by banks due to its availability and smooth operating system.

5. The satisfaction level of customers is given, which is divided into three parts as fully satisfied, partially satisfied and unsatisfied. It is also observed that 116 (72.50 per cent) customers are fully satisfied with technological services, 24 (15 per cent) customers are partially satisfied and only 20 (12.50 per cent) customers are unsatisfied that they are facing Technical problems or operational problems or socio-economic problems or other problems in using ATM service.

6. Lack of explosive to electronic device, the operational problem tops the list of problems such as lack of technical knowledge of handling cash withdrawal through ATM Card, Illiteracy is one more handicap in handling the ATM. Highest number of customers 66 (41.3 percent) faced operational problem. Table 4.16 and figure 4.16 present the frequency and per cent of customers facing these problems. Last row of the table presents

7. Ranking of the problems by area, it is observed that the customers of Branches located in Agricultural area are facing more problems, followed by customers in Tribal Area and least problems are faced by the customers in Industrial area.

8. Another problem is that of security at ATM Centre, which at times is broken by thieves and cash, blocked cards etc are stolen away. 65 (40.6 per cent) are afraid of the lack of or inadequacy of security at ATM. 3<sup>rd</sup> Problem faced by ATM customers is lack of smooth transactions on account of closure of the machine or failure of electricity during the transaction. Other problems include money is debited to customers account though the withdrawal is failed due to technical reasons. These problems of ATM users call for immediate solutions for customer care, failing which, some of the services provided would remain unutilized.

9. Top ranking problem before 24 Customers (48 per cent) is that of smooth conduct of transactions, followed by operational problem faced by 23 customers (46 per cent) ranked 2<sup>nd</sup>, other problems as defined above faced by 21 (42 per cent) customers. Security problem in this service was perceived to be the least important problem faced by 20 (40.0 percent) customers.

10. An interbank comparison of the number of customers facing all types of problems was highest at 18 (36 per cent) customers of Axis Bank where as in other two banks; HDFC and ICICI banks, the number was 16 each (32 per cent). Axis Bank proves to be less efficient in case of this service.

11. There is no inter-area significant difference in the efficiency of banks in providing this service to customers. However, if we compare the number of customers per bank facing no problems in connection with internet banking, ICICI bank has the highest number of 6 customers out of a total of 14 (43.0 per cent).

12. If we compare the inter-bank efficiency in providing this service, the number of customers having no problems with this service is highest at 8 customers (42 per cent) and lowest with Axis bank, 5 ( 26 per cent). Conversely, if we compare the total number of customers having problems in enjoying other services, the lowest number is 35 (30 per cent) each with Axis and HDFC banks. ICICI bank has a highest number of dissatisfied customers 44 (40 percent).of this service. This shows that efficiency of ICICI bank is less as compared to other two banks.

13. Inter-service Matrix of Customer services and Customers Problems showed that Operational problems are ranked first for ATM Service users, Safety and Security problems are ranked first for Debit/Credit Card service users, Technical problems are ranked first in using Internet banking services and Phone banking services and other technical services are ranked first in misc. problems. It shows that not a single technical service is

completely developed and successfully carried by banks though they are well developed in providing E-banking services.

14. 150 user customers are facing the problem of Operating the services, Safety and security problem is faced by 205 user customers, 188 customers are facing the problem of Technical services and 169 user customers are facing the problem of Miscellaneous services. It is observed that the major problem while using the services is that the large number of customers are facing the problem of security and safety in performing the transactions, thus they are not eager for using the services. But operating problem of machine is faced by fewer customers; it means the customers' computer literacy is still lacking that prohibits them from making frequent use of IT aided bank services.

15. Thus, it can be concluded from the above analysis that though electronic transfer services are made available, there are problems in making use of these services on the part of customers. These problems are more serious with computer illiterate customers and particularly acute with rural ill-educated customers. There is a need for an initiative on the part of banks to train not only their human resource but also their clientele in conduct of electronic bank transactions.

### Testing of Hypotheses

Following were the pre-determined statements of hypotheses tested through this study:

**1. The customers face problems in using New Services offered by Private Sector Banks.**

Barring a small fraction of around 8 per cent of the customers using above mentioned services, a large proportion of 92 per cent of customers are facing one or more problems in using these specified services .( Please refer to Tables 4.22 A, B, and C PP 102-103). **This statement of hypothesis is proved.**

**2. The effectiveness of customer services depends on the attitude of bank employees and managerial inputs.**

This statement of hypothesis could not be explicitly tested because responses of the officers and employees of the bank were very vague. However, there is a clear indication from the majority of respondents expressing dissatisfaction over the efficiency in supplying the specified services that the attitude of bank employees and managerial inputs is not favorable to make these services customer friendly. **Thus, the second hypothesis is also proved.**

### Suggestions

It is difficult to find workable solution when there is a great disparity between the expectations and fulfillment. Customers expect too much efficient services from their banks, which face a number of limitations in implementing innovative bank services. Even then, following workable solutions are suggested:

1. More and more customers of the banks are to be encouraged to utilise electronic bank services to enhance the volume of transactions off the counter.
2. Every bank must have a customer care counter, where a bank officer or employee shall be available on line around the clock so that the customer can call bank and get his/her query satisfied instantly.
3. There has to be clear instructions to the customers on line as to how effectively an electronic bank service could be utilized because most of the customers face transactional problems in case of phone banking, internet banking and Debit/Credit card transactions.
4. Customers from rural area must be promptly attended because they face more problems than urban elite customers.
5. Bank employees may be provided with training, workshops, and refresher courses in customer care for dealing with complaints relating to all electronic banking services. The course content should be such that customers should feel free while discussing their difficulties with their bankers.
6. Banks may also organise region-wise customers' camps for discussing with them their problems and finding solutions on the spot. This will encourage more people to use these services and the business of the banks may increase.
7. Banks, while assessing the performance of their officers/employees may assign special credit points to those who take special efforts in making their customers fully satisfied.

## IMPACT OF SPIRITUALITY ON LIFESTYLE OF TEACHERS

**Dr. CA Trupti Gamaji Deore**

*M.Com, NET, SET, Chartered Accountant, PhD, BA (Values & Spiritual Education)  
Asst. Professor, KSKW Arts, Science & Commerce College, CIDCO, Nashik-08*

### **Abstract**

*The Spirituality is a broad concept than the religion or meditation. In today's life every minute and every work is counted, the management of the life style plays a vital role in this. The spirituality helps to develop the management skills in terms of time management, work management, diet management, and physical as well as mental health management. This researcher conducted the study of life style, routine work and the spirituality in all of this day-to-day activity, its impact on the working people in education field. The spirituality not only improves the innate values of a soul but also has a positive effect on every activity performed by that person. This paper helps the reader to know about the Spirituality, Spiritual Lifestyle and the impact of spirituality on the life of those people. The researcher studied the topic with the help of data collection through questionnaire from 100 teachers.*

**Keywords:** Spirituality, Lifestyle, Supreme Soul, Meditation, Diet, Amritvela, Yog, Religion, Purity, Attributes, Soul, Innate Value, Soul Consciousness, Churning

**Introduction:** In today's world, the spirituality is more associated with rituals, religious bigotry and sometimes linked up with fundamentalists' attributes. Lifestyle reflects people's self image or self concept; the way they see themselves and believe they are seen by the others. Lifestyle is a composite of motivations, needs, and wants and is influenced by factors such as culture, family, reference groups, and social class Living Habits turn into the way of living. Our Indian history has many incidents that the Spiritual lifestyle of the human being brings them all the attributes of soul viz. peace, happiness, bliss, purity, love, knowledge & power.

### **I. Objectives:**

- 1) To know the meaning of term Spirituality and Spiritual Lifestyle.
- 2) To know the lifestyle of teachers with the help of questionnaire.
- 3) To study the effect of Spirituality on the lifestyle of teachers & knowledge of spirituality.

### **II. Research methodology:**

#### **1) Research Design:**

- The researcher has prepared the Questionnaire, for Primary data, related to the objectives decided.
- All the questions are close ended by options of "Yes" and "No".
- It is more structured questionnaire to analyse the topic under study because one can be explained in more detail about their feelings and experience.

#### **2) Sample Selection:**

- The sample used for the research design comprised of 100 teachers from Junior College, Senior College and School of MVP Samaj Educational Institution.
- The respondents include the teaching faculty from urban and semi urban colleges & schools, aging 25 to 57 Years.

### **III. Spirituality:**

"Spirituality means a connection of soul to the Supreme Soul"

- Brahmakumaris Ishwariya Vishwa Vidyalaya

"Spirituality is a brave search for the truth about existence, fearlessly peering into the mysterious nature of life."

- Elizabeth Lesser

▪ Spirituality is not a luxury, something for people who have nothing else to do but sit around and meditate. In fact, it is the lack of spirituality in daily life that is causing the breakdown and destruction of our

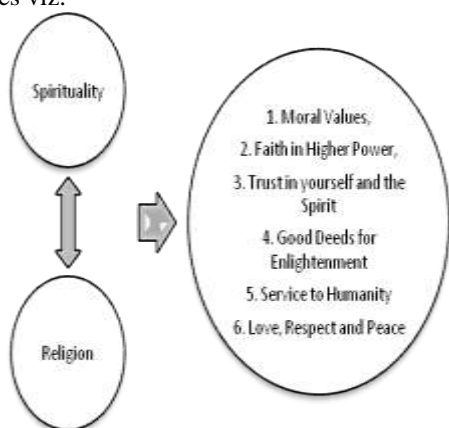

planet and our civilization. As we restore spirituality we can find methods of working together to create better selves and a better world.

- When the spirit manifests in terms of its innate qualities such as purity, peace, bliss, love, happiness and power, then one is in a spiritual state of existence.
- In simple words, the spirituality is direct connection to the supreme power of all souls which brings changes to the innate values of the soul.
- There are no mediators, no voice, no requirements, no expectations, only silence and feelings of continuous energy flow in our soul from such Ocean of energy.
- Spirituality is different than the religion. Religion can be a way towards the Spirituality but Spirituality is not ultimately results in religion.

**Differences between Spirituality & Religion**

Point of Difference	Spirituality	Religion
Derivation of term	Spirit means energy. Spirit derives from latin word “Spiritus” which means Breath.	Religion derived from latin word “religio” which means Obligation or bond.
Meaning	It is related to Divine	It is a collection of beliefs, scriptures, traditions, practice of worship to God
Connectivity	It is a personal and direct connection with the Universe and God	It is indirect connection with the God
Relation	It is related to mind & thinking pattern	It is related to tradition & culture
Inter-dependability	Spirituality can exist without religion	Religion can be a part of Spirituality

Even though Spirituality differs from Religion, it is most of the times connected with religion due to some of the similarities viz.

**Similarities in Spirituality & Religion**

**IV. Spiritual Life Style:**

- Involvement of spirituality in every activity of the routine life is called as Spiritual Life Style.
- It is a life style which is a reflection of innate values of soul in daily working and it becomes the routine of the person.
- It a life style which is followed from the time we wake up till the time we go to bed.
- The spirituality may be included in following ways for better life style:

**1. Early Morning Meditation:**

- The morning time is a most pure and effective timing to acquire the energy and fill up the powers in the soul.
- Nectar timing (Amritvela) is the foundation for the whole day.
- The 2 am to 6 am is timing perfect for making ourselves complete with either good thoughts for all or by spinning the cycle of self realization. By doing this, we are able to accumulate lot of power in life.

**2. Daily Spiritual Study:**

- Spiritual study involves good thoughts, positive thoughts, implication of thoughts in action, churning of knowledge in whole day, etc.
- It doesn't mean to read daily spiritual books, articles, stories or any ritual books.
- It is virtues of God, positive thoughts towards daily behavior from the ocean of knowledge Supreme Soul.
- While keeping regularity and punctuality in such spiritual study, it helps to inculcate the values automatically in daily routine and it becomes the part of our personality.

**3. Following Purity:**

- Purity which also called as Celibacy includes the seven forms. Each form of Celibacy has its own benefits to the individual in his/her life as followed by them.

**Forms & Benefits of Purity/ Celibacy**

Sr. No.	Form	Benefits
1	Bodily	- Useful to maintain health of body. - Gives power to develop immunity to several kinds of diseases. - Increase the strength, stamina and zeal for continuous work. - Results in Optimism, Cheerfulness, endurance, courage.
2	Mental	- Brings determination to one's thoughts. - Develops will power - Increase concentration - Helps to achieve the way of progress and happiness in life.
3	Intellectual	- Capabilities grow to a greater extent. - Intellect itself becomes righteous.

4	Moral	- Purification of outlook, thoughts and habits. - Gets over the temptations and allurements.
5	Spiritual	- Realization of self and the God. - Detachment from body and mind and become soul consciousness.
6	Financial	- Brings the proper way to earn money. - To satisfy the financial needs and spend it on proper purpose only.
7	Social	- Uplift of moral, financial and cultural values in individual brings the social values automatically. - Scarcity of resources can be controlled by decrease in population growth.

#### 4. **Diet and Nutrition:**

- The person's nature becomes what he/she eats. The person preparing food, ingredients of food, quality of food, and these all has direct effect on the person who eats that food.
- That's why the food prepared by Mother is always delicious irrespective of its ingredients as mother always prepares the food with full devotion and lots of love.
- The spirituality has effect of diet and nutrition based on the three aspects of offering the food viz. State of mind while cooking, bhog to God and State of mind while you eat the food.
- A person who wishes to improve spirituality should take the kind of food that helps him/ her in achieving his/ her object and abstain from the rest of the food as undesirable.
- The food has effect on the thoughts and conduct of the person, that's why food is also categorized in three ways such as Tamasic food, Rajasic food and Sattvic food.

#### 5. **Selfless Service:**

- There are two types of services which a person perform viz. Service with Love and Service as Duty.
- **One**, who does the service with love and affection, would not leave any soul without infusing love for God into him/her.
- **Another**, who is duty bound, would finish his duty, would finish the one week course, hold Rajyoga camps and read out the Godly versions to the new comer, but would not consider it as his/her responsibility to bring the soul into love-full connection with God.
- It is a law of service that only the one, who has the capability or Love for God, can infuse the same capability or quality of love in others.

#### 6. **Churning Knowledge:**

- Churning makes the one empowered and develops different powers in the self and create a very good self respect.
- Churning knowledge means to think about the knowledge, understand it and develop a clear picture in your mind, think about the benefits of being a pure and peaceful soul. Only when you consider the benefits of the knowledge, you will apply it in your daily interaction.
- Such churning develops the ability of individual to think on any point from all possible perspectives and develop the capabilities to include the good and clear knowledge in the daily routine.
- Churning of the knowledge helps the soul to gain more power; Happiness dominates the conscious, Natural Peace in ones outlook, Real service to the humanity, Changes in Personality and the state of Natural bliss.

#### 7. **Soul Consciousness:**

- Soul Consciousness means to stay in the form of soul, detached from all material matters, relations and thoughts.
- It is the foundation of Spirituality because it connects the flow of energy from God directly to the soul.
- Pure thoughts which flow from soul consciousness bring the spirit closer to God.

- In soul consciousness, it is easy to control and concentrate the mind and be free from useless thoughts, anxieties, tensions and confusions.
- When the source of power and peace is taped, inner strength and will power become stronger which in turn makes the soul more efficient and alert.
- This state helps to purify and clean the intellect and helps to absorb or inculcate pure knowledge.
- The consistent practice of soul consciousness brings the treasure of eight powers to the spirit which helps to build the more efficient karma in the life.

**Powers of Soul (Virtues)**

**8. Thinking Pattern:**

- Thinking is an art that requires the most effort.
- Thoughts triggers certain feelings, feelings take the shape of our attitude towards someone or something, Attitude further shapes our behavior as we interact with others and all such behavior becomes the habits. Habits constitutes unique personality, personality states our life structure or life style and ultimately our destiny.
- It means the whole personality of the person is depending on the way of thinking, way of reacting and behavior with the others and self.
- When thinking becomes habitual as it does within our daily routines, we enter in a vicious cycle of negative or stressful thinking.
- Once we identify the cycle, it is much easier to break that cycle while replacing negative thoughts with positive ones.
- The quality of thoughts determines our level of happiness. As said by Buddha in Dhammapada, “If a man speaks or acts with evil thought, sorrow will follow him as the cart goes after the ox.”
- Thoughts are the vibrations of the mind; therefore the pattern of positive and creative thinking helps to meditate more effectively.

**9. Meditation:**

- The meditation is an essential part of spirituality.
- Spirituality can be feeling more effectively through mediation.
- Meditation doesn’t mean to sit at one place with specific position and listening mantras or soft music.
- Meditation is a feeling which brings only when the soul has acquired the purity in thoughts, clarity in mind and detachment from the world.
- Meditation gives the powers to the soul accompanied with the qualities.
- Qualities can or cannot be disclosed to someone but Power is always felt and discloses automatically when we get it. Power will never be hidden if we have that in us.
- Meditation provides the benefits such as the company of God which brings strength and pleasure, awakening the soul, influence on every action, power to become completely pure, ability to overcome difficulties, to spread peace by giving to others.

**V. Analysis & Interpretation:**

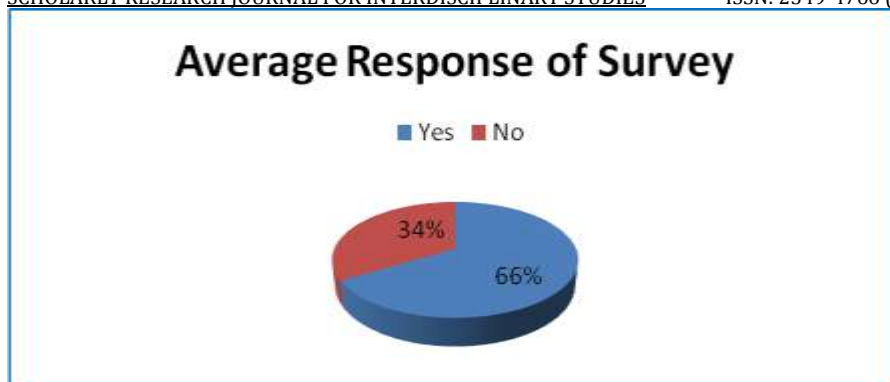

The data is analysed with the help of charts and graphs. The graphs/ charts are prepared for each question. The summary of all questions and their reply is as follows:

**Table 4.1 Compilation of Answers from Questionnaire**

Question	No. of Respondents having answer as
----------	-------------------------------------

	Yes	No
Do you have any idea about the Spirituality and religion?	92	08
Does Spirituality means connection of Soul to Supreme Soul (Power) for acquiring the powers/ energy?	92	08
Does spirituality means religion?	14	86
Does Spirituality mean to read daily religious and spiritual books, articles, stories, etc.?	15	85
Do you think that meditation is a part of religion?	26	74
Do you think that meditation is a part of Spirituality?	81	19
Do you know about the meditation techniques?	80	20
Do you pray/ remember the GOD at least once in a day?	90	10
Do you feel relax, happy & peaceful after meditation?	96	04
Does Spirituality lead to improve our innate values to work effectively at the workplace?	95	05
Do you feel positivity in your work due to meditation?	95	05
Is there any impact of your behaviour on others or environment surrounded by you?	92	08
Are you satisfied with your job or work at the institution?	98	02
Do you think Spirituality brings peace at mental level?	92	08
Do you start your day with newspaper/ TV Programmes?	36	64
Due to Spirituality, can you feel flexible to adjust the daily routine?	90	10
Does non-vegetarian food affect the Spirituality?	53	47
Does Sattvic food means food without onion, garlic & Food served to GOD as a Naivadya?	28	72
Can physical health be maintained through spirituality up to certain level?	91	09
Does Spirituality helps to increase Decision Making power?	87	13
Do you know the Spiritual Leader Brahmakumari Rajyogini Dadi Janki has The Most stable mind in the earth?	40	60
Do you know the TV channel "PEACE OF MIND" ?	47	53
Will you interested to Learn RAJYOGA MEDITATION at free of cost?	72	28
Are you interested to take admission for the course B.A in Values and Spiritual Education launched by YCMOU?	54	46
Do you have any substance addiction? Tobacco / Wine / Cigarettes /Bidi / any other.	04	96
<b>Response</b>	<b>Average %</b>	
Yes	66.40	
No	33.60	

Out of total 100 respondents, there are 66 persons gave their response as Yes whereas the remaining 34 persons are not in the favor of the questions.

#### **VI. Finding & Conclusion:**

##### **Findings:**

From the project and survey for the project has following findings:

- 1) The questionnaire is appreciated by teachers as it is drafted very clear and logically.
- 2) The answers given by each teacher is with full devotion and concentration because the topic selected was something new for them.
- 3) The respondents enjoy the questionnaire and they also ask many things after answering the questionnaire, about the course, spirituality, values, etc.
- 4) The data is not collected from the same unit where the researcher works, therefore the realistic and reliability is maintained.
- 5) The researcher also found that there are many things about spirituality which needed to clarify such as diet, daily routine and meditation techniques.

##### **Conclusion:**

The researcher has concluded the project with comparison of objectives set before conducting the survey and the responses from the people.

1. There is more awareness of the term spirituality in educational field.
2. The life style of teachers is comparatively better and proper which can explore the spirituality.
3. The erg to learn new things, to spread knowledge and be active in most of the area is the good thing I found in teachers.
4. Regarding the diet and nutrition, it was found that many teachers are of opinion that the food or properties of food have no effect on the Spirituality level.
5. Researcher also concludes that the Spirituality concept is more accepted by teachers on scientific and logical background.
6. The teachers due to their experience and knowledge from various are able to differentiate between the Religion and Spirituality, which is from my point of view, is important. It is important because the teacher should be unbiased while teaching or behavior with the society and this approach helps them to be more as a Teacher than a normal person.
7. There are many teachers who do the meditation but they want to learn the proper technique of the meditation for more effective experience.
8. Those who daily practice meditation, have the benefits of flexibility in work, relaxation and power of decision making on time.
9. There are most of the teachers who provide specific time to remember the God at least once in a day, not by traditional way of Puja but by thanking for the life.
10. It is also found that the life style followed by teachers is habitual due to their job timing and schedule which indirectly support the spirituality, such as start the morning, state of mind while working, food schedule, no consumption of addiction items, have patience, handle the stress, etc.

11. In short, the researcher will conclude that the Spiritual life style is not the special life style or rules to be followed, but the regular life style can be modified with some spiritual touch. This will actually enhance the powers of soul and the personality of the people. It also improves the job efficiency and performance at workplace.

## NEW AGRICULTURE POLICY IN INDIA

**Dr. K.D.Jadhav**

*Sangamner college, Sangamner*

**Introduction** Agriculture is a way of life, a tradition, which, for centuries, has shaped the thought, the outlook, the culture and the economic life of the people of India. Agriculture, therefore, is and will continue to be central to all strategies for planned socio-economic development of the country. Rapid growth of agriculture is essential not only to achieve self-reliance at national level but also for household food security and to bring about equity in distribution of income and wealth resulting in rapid reduction in poverty levels. Indian agriculture has, since Independence, made rapid strides. In taking the annual foodgrains production from 51 million tonnes in early fifties to 206 million tonnes at the turn of the century, it has contributed significantly in achieving self-sufficiency in food and in avoiding food shortages. Over 200 million Indian farmers and farm workers have been the backbone of India's agriculture. Despite having achieved national food security the well being of the farming community continues to be a matter of grave concern for planners and policy makers. The establishment of an agrarian economy which ensures food and nutrition to India's billion people, raw materials for its expanding industrial base and surpluses for exports, and a fair and equitable reward system for the farming community for the services they provide to the society, will be the mainstay of reforms in the agriculture sector. The National Policy on Agriculture seeks to actualise the vast untapped growth potential of Indian agriculture, strengthen rural infrastructure to support faster agricultural development, promote value addition, accelerate the growth of agro business, create employment in rural areas, secure a fair standard of living for the farmers and agricultural workers and their families, discourage migration to urban areas and face the challenges arising out of economic liberalization and globalisation. Over the next two decades, it aims to attain

### **Objective of the Study:**

1. To study the salient features of the new agricultural policy.
2. To inform the various aspects of the new agricultural policy.

### **The salient features of the new agricultural policy are:**

1. Over 4 per cent annual growth rate aimed over next two decades..
2. Greater private sector participation through contract farming.
3. Price protection for farmers.
4. National agricultural insurance scheme to be launched.
5. Dismantling of restrictions on movement of agricultural commodities throughout the country.
6. Rational utilisation of country's water resources for optimum use of irrigation potential.
7. High priority to development of animal husbandry, poultry, dairy and aquaculture.
8. Capital inflow and assured markets for crop production.
9. Exemption from payment of capital gains tax on compulsory acquisition of agricultural land.
10. Minimise fluctuations in commodity prices.
11. Continuous monitoring of international prices.
12. Plant varieties to be protected through a legislation.
13. Adequate and timely supply of quality inputs to farmers.
14. High priority to rural electrification.
15. Setting up of agro-processing units and creation of off-farm employment in rural areas.

**Sustainable Agriculture** The policy will seek to promote technically sound, economically viable, environmentally non-degrading, and socially acceptable use of country's natural resources – land, water and genetic endowment to promote sustainable development of agriculture. Measures will be taken to contain biotic pressures on land and to control indiscriminate diversion of agricultural lands for non-agricultural purposes. The unutilized wastelands will be put to use for agriculture and afforestation. Particular attention will be given for

increasing cropping intensity through multiple-cropping and inter-cropping. Rational utilization and conservation of the country's abundant water resources will be promoted. Conjunctive use of surface and ground water will receive highest priority. Special attention will be focused on water quality and the problem of receding ground-water levels in certain areas as a result of over-exploitation of underground aquifers. Proper on-farm management of water resources for the optimum use of irrigation potential will be promoted. Erosion and narrowing of the base of India's plant and animal genetic resources in the last few decades has been affecting the food security of the country. Survey and evaluation of genetic resources and safe conservation of both indigenous and exogenously introduced genetic variability in crop plants, animals and their wild relatives will receive particular attention. The use of bio-technologies will be promoted for evolving plants which consume less water, are drought resistant, pest resistant, contain more nutrition, give higher yields and are environmentally safe. Conservation of bio-resources through their *ex situ* preservation in Gene Banks, as also *in situ* conservation in their natural habitats through bio-diversity parks, etc., will receive a high priority to prevent their extinction. Specific measures will also be taken to conserve indigenous breeds facing extinction. There will be a time bound programme to list, catalogue and classify country's vast agro bio-diversity. Sensitization of the farming community with the environmental concerns will receive high priority. Balanced and conjunctive use of bio-mass, organic and inorganic fertilizers and controlled use of agro chemicals through integrated nutrients and pest management (INM & IPM) will be promoted to achieve the sustainable increases in agricultural production. A nation-wide programme for utilization of rural and urban garbage, farm residues and organic waste for organic matter repletion and pollution control will be worked out. Agro-forestry and social forestry are prime requisites for maintenance of ecological balance and augmentation of bio-mass production in agricultural systems. Agro-forestry will receive a major thrust for efficient nutrient cycling, nitrogen fixation, organic matter addition and for improving drainage. Farmers will be encouraged to take up farm/agro-forestry for higher income generation by evolving technology, extension and credit support packages and removing constraints to development of agro and farm forestry. Involvement of farmers and landless labourers will be sought in the development of pastures/forestry programmes on public wastelands by giving financial incentives and entitlements to the usufructs of trees and pastures. The history and traditional knowledge of agriculture, particularly of tribal communities, relating to organic farming and preservation and processing of food for nutritional and medicinal purposes is one of the oldest in the world. Concerted efforts will be made to pool, distil and evaluate traditional practices, knowledge and wisdom and to harness them for sustainable agricultural growth.

**Inputs Management** Adequate and timely supply of quality inputs such as seeds, fertilizers, plant protection chemicals, bio-pesticides, agricultural machinery and credit at reasonable rates to farmers will be the endeavour of the Government. Soil testing and quality testing of fertilisers and seeds will be ensured and supply of spurious inputs will be checked. Balanced and optimum use of fertilizers will be promoted together with use of organic manures and bio-fertilizers to optimize the efficiency of nutrient use. Development, production and distribution of improved varieties of seeds and planting materials and strengthening and expansion of seed and plant certification system with private sector participation will receive a high priority. A National Seed Grid will be established to ensure supply of seeds especially to areas affected by natural calamities. The National Seeds Corporation (NSC) and State Farms Corporation of India (SFCI) will be restructured for efficient utilization of investment and manpower.

Protection to plant varieties through a *sui generis* legislation, will be granted to encourage research and breeding of new varieties particularly in the private sector in line with India's obligations under TRIPS Agreement. The farmers will, however, be allowed their traditional rights to save, use, exchange, share and sell their farm saved seeds except as branded seeds of protected varieties for commercial purpose. The interests of the researchers will also be safeguarded in carrying out research on proprietary varieties to develop new varieties.

**Sustainability and natural resource management** The Policy document emphasizes a prescriptive framework based largely on technological opportunities for conservation and exploitation of natural resources. There are a large number of policy issues which have either been ignored or avoided. For example, rational land use has been cursorily treated. Natural resources experts have been pleading for increase in forest cover, alternate land use patterns in catchment areas, and rational urban land use. Similarly, inefficient and unsustainable use of water resources has been pointed out by several expert committees. Common property resources are also threatened.

The point is that the policy document does not address the really critical issues. It is obvious that in the absence of clear regulatory policies, the proposed technological fixes or investments will be infructuous. We can go on allocating funds for watershed development, agroforestry, soil conservation, and so on, but these will not produce desired results. Professional bodies like the National Academy of Agricultural Sciences etc have indicated clearly what the policy imperatives are. These have been ignored. The problem is that these prescriptions are not politically expedient. Nevertheless, it is essential that a political consensus is developed on critical issues. The bottom line is that unless we have regulatory policies in place, strategies to conserve natural resources and ensure sustainability will not work. Specifically, the policy document must explicitly indicate the official position with respect to these aspects. In this context, the debate over the preceding years needs to be qualitatively upgraded. Sustainability issues inevitably involve trade-offs. There will be losers. The society will have to make the choice to forego some current consumption if posterity is to be provided for. Left purely to unguided market forces, this will not happen. Answers to these questions lie in the domain of political economy. Nevertheless, these are crucial and a policy document devoid of these dimensions serves little purpose.

**Institutional change** The existing institutional support mechanism for Indian agriculture is grossly inadequate to meet future challenges. These have evolved in a context which has ceased to be relevant. These relate to the entire range of institutional arrangements whether they are concerned with use of natural resources, inputs, marketing and trade, or R&D and transfer of technology. While there is a need to think anew about these aspects, the policy document takes an incrementalist approach. This may be justified if a short term view is taken but a long term policy document must spell out new approaches and new institutions. The basic paradigm shift required relates the role of the state. It has been a historical presumption that the government knows what is to be done in areas like credit, marketing, R&D, and everything else needed for agricultural development. Over the last decade or so non-government organizations have demonstrated that this premise does not hold. Even otherwise, inadequacies arising from interventionist approach have been laid bare. Yet the policy document has not been able to break this barrier. It does mention reforms in existing institutional structure but is vague about new arrangements. It is obvious that strong farmer organizations will be the nodal institutions for change covering production, marketing and trade. A new cooperative (self-help) framework, free from the shackles of bureaucratic control and restrictive procedures will have to be developed. Unless producers are empowered effectively, the potential cannot be exploited and the projected growth scenario will not materialize. There is need to develop national policy to ensure that such institutions are fostered. Such grassroot level organizations will make decentralization meaningful and relevant. In addition to the organizational aspect, it will be necessary to inject greater professionalism across the board to ensure that technology, management, and other skills are imbedded in the new scheme. These cannot be left to the line departments of the government. In order to respond to this challenge, trained manpower will be necessary and new initiatives in agricultural education will be required.

**Investment priorities** There are two serious problems with regard to investment in agriculture. The document does talk about infrastructure and market development (Chapters 6 and 7) but there is no articulation of priorities and sequencing. As such, the document reads like a wish-list including everything. This is perhaps necessary in a very long term perspective, but it would be necessary to define a pathway to reach the long term goal. Economic development literature provides guidelines on the relationships between hard and soft infrastructure and the roles of public and private investments. These could provide indicative investment priorities, their sequencing and the role of public and private capital. There is a need to develop a consensus on investment themes, priorities, and policies. Secondly, one needs to ask why this obvious task has not been undertaken despite a long debate. The policy document is driven by the Ministry of Agriculture. On the other hand, most investment decisions, particularly in the infrastructure area, are taken in other ministries (Water Resources, Transport, Power, Industries, Rural Development, Communication, etc). The Planning Commission has the task of synthesizing an investment profile consistent with overall development goals. Agriculture-related investments have to be based on these parameters; otherwise an open-ended wish-list is all that will emerge. The initiative proposed in the recent budget to dovetail all infrastructural investments in a holistic framework is a welcome step. Investment priorities and decisions are greatly influenced by political considerations. Choice affects different interest-groups differently: there are always gainers and losers. It is expedient to make a comprehensive list and avoid conflict and controversy. But this undermines the very

purpose of articulating a policy framework. The Policy document must lend strength to the claim for greater investment in rural areas, and also re<sup>e</sup> examine its programmes in the light of complementarities.

**Incentives** The document has not articulated a clear vision on the incentive framework. It implies that liberalized trade in domestic and international market, improved infrastructure, access to inputs including credit, and similar structural reforms will lead to a conducive incentive environment. It cautiously avoids any reference to direct state intervention, except in context of poverty alleviation. The normative tenor of the framework avoids difficult questions. For example, there is the issue of possible trade-off between food security and income growth and the need to chart a clear position on this in the policy document. This will mean some intervention to retain incentives for food production within the ambit of WTO stipulations. Again, and in the same vein, it is doubtful if potential for agriexports can be realized without explicit support. The document evades the question how farms of one or two hectares will respond to withdrawal of subsidies on irrigation, fertilizers, or power. The issue of incentives is of critical significance in the long-run as it affects inter-sectoral transfer of resources. Terms of trade is a short-term segment of this equation. As we develop a future policy framework, we must not ignore the basic axiom of structural transformation of the economy and reduce its dependence agriculture. It is an implicit process of economic development. It will be desirable and legitimate through alleviate, the misery associated with this adjustment through a set of policies and instruments. The document does not take explicit cognizance of this question of relative incentive structure is a major shortcoming of the document. To sum up the statement must answer questions like : will the agricultural structure be small farm oriented? How the government intends to regulate use of land, water and other natural resources? What new institutional framework is contemplated? How will the basic rural-urban divide be addressed? The bottom line is that it is infructuous to ignore contentious but basic issues. The document would have served a better purpose if these issues were laid out upfront. A meaningful debate would then have ensued enabling the society to make an informed choice. Promising everything to everyone is no statement at all.

**Conclusion:** 1. The New Agricultural Policy (2000) has been considered as a balanced one considering the present requirement. The new policy has adopted a coordinated approach for bringing Green Revolution, White Revolution (related to milk and dairy products) and Blue Revolution (related to aqua/fish culture). Therefore, the policy has been termed as a policy of promising Rainbow Revolution. Considering the growing requirement of food for attaining food self-sufficiency and to attain food security for the millions of people of the country the policy has faced a great challenge. To fulfill this requirement attainment of 4 per cent growth rate in agricultural output is a must. But the New Policy has not spelt out any such target in quantitative terms. 2. The New Policy has also failed to identify those backward states which are still lagging in utilizing their agricultural potential. Therefore, a balanced approach should be undertaken to remedy these loopholes. 3. The New Policy argued in favour of encouraging private investment in agriculture which would help the big farmers, but the large numbers of small farmers are not going to be supported by such private investment which needs to be promoted by public investment. 4. The New Policy argued in favour of private sector participation through contract farming by land leasing arrangements. But introduction of such a step in a labour-surplus economy is highly questionable. 5. There is a lack of co-ordination between the Central and State Governments in implementing various promotional steps for the development of agricultural sector. Thus, the centre and the states should co-ordinate in implementing various provisions of new policy and should develop a monitoring mechanism to evaluate the implementation of the policy in a most rational manner.

## GST STRUCTURE & FUTURES

**Prof. Vijay Bhadake**

*Dept. Of Economics, Arts Science & Commerce College Rahuri*

**Introduction:** The benefits of GST can be summarized as under: For business and industry o Easy compliance: A robust and comprehensive IT system would be the foundation of the GST regime in India. Therefore, all tax payer services such as registrations, returns, payments, etc. would be available to the taxpayers online, which would make compliance easy and transparent. o Uniformity of tax rates and structures: GST will ensure that indirect tax rates and structures are common across the country, thereby increasing certainty and 2 ease of doing business. In other words, GST would make doing business in the country tax neutral, irrespective of the choice of place of doing business. o Removal of cascading: A system of seamless tax-credits throughout the value-chain, and across boundaries of States, would ensure that there is minimal cascading of taxes. This would reduce hidden costs of doing business. o Improved competitiveness: Reduction in transaction costs of doing business would eventually lead to an improved competitiveness for the trade and industry. o Gain to manufacturers and exporters: The subsuming of major Central and State taxes in GST, complete and comprehensive set-off of input goods and services and phasing out of Central Sales Tax (CST) would reduce the cost of locally manufactured goods and services. This will increase the competitiveness of Indian goods and services in the international market and give boost to Indian exports. The uniformity in tax rates and procedures across the country will also go a long way in reducing the compliance cost. □ For Central and State Governments o Simple and easy to administer: Multiple indirect taxes at the Central and State levels are being replaced by GST. Backed with a robust end-to-end IT system, GST would be simpler and easier to administer than all other indirect taxes of the Centre and State levied so far. o Better controls on leakage: GST will result in better tax compliance due to a robust IT infrastructure. Due to the seamless transfer of input tax credit from one stage to another in the chain of value addition, there is an inbuilt mechanism in the design of GST that would incentivize tax compliance by traders. o Higher revenue efficiency: GST is expected to decrease the cost of collection of tax revenues of the 3 Government, and will therefore, lead to higher revenue efficiency. □ For the consumer o Single and transparent tax proportionate to the value of goods and services: Due to multiple indirect taxes being levied by the Centre and State, with incomplete or no input tax credits available at progressive stages of value addition, the cost of most goods and services in the country today are laden with many hidden taxes. Under GST, there would be only one tax from the manufacturer to the consumer, leading to transparency of taxes paid to the final consumer. o Relief in overall tax burden: Because of efficiency gains and prevention of leakages, the overall tax burden on most commodities will come down, which will benefit consumers.

**Definition:** Goods and Service Tax is a complete tax imposed on manufacture, sale and expenditure of goods and service. It is mostly a proxy of all indirect taxes which imposed on goods and services by the Central and State government of India. Goods and Services Tax would be levied and collected at each phase of sale or purchase of goods or services based on the input tax credit process.

**Administration :** Keeping in mind the federal structure of India, there will be two components of GST – Central GST (CGST) and State GST (SGST). Both Centre and States will simultaneously levy GST across the value chain. Tax will be levied on every supply of goods and services. Centre would levy and collect Central Goods and Services Tax (CGST), and States would levy and collect the State Goods and Services Tax (SGST) on all transactions within a State. The input tax credit of CGST would be available for discharging the CGST liability on the output at each stage. Similarly, the credit of SGST paid on inputs would be allowed for paying the SGST on output. No cross utilization of credit would be permitted.

### Features of GST :

#### A- Constitution

The salient features of the Bill are as follows:

- Conferring simultaneous power upon Parliament and the State Legislatures to make laws governing goods and services tax;
- Subsuming of various Central indirect taxes and levies such as Central Excise Duty, Additional Excise Duties, Service Tax, Additional Customs Duty commonly known as Countervailing Duty, and Special

Additional Duty of Customs; Subsuming of State Value Added Tax/Sales Tax, Entertainment Tax (other than the tax levied by the local bodies), Central Sales Tax (levied by the Centre and collected by the States), Octroi and Entry tax, Purchase Tax, Luxury tax, and Taxes on lottery, betting and gambling; Dispensing with the concept of 'declared goods of special importance' under the Constitution; Levy of Integrated Goods and Services Tax on inter-State transactions of goods and services; GST to be levied on all goods and services, except alcoholic liquor for human consumption. Petroleum and petroleum products shall be subject to the levy of GST on a later date notified on the recommendation of the Goods and Services Tax Council; Compensation to the States for loss of revenue arising on account of implementation of the Goods and Services Tax for a period of five years; Creation of Goods and Services Tax Council to examine issues relating to goods and services tax and make recommendations to the Union and the States on parameters like rates, taxes, cesses and surcharges to be subsumed, exemption list and threshold limits, Model GST laws, etc. The Council shall function under the Chairmanship of the Union Finance Minister and will have all the State Governments as Members.

**B- Registration :** The major features of the proposed registration procedures under GST are as follows:

- Existing dealers: Existing VAT/Central excise/Service Tax payers will not have to apply afresh for registration under GST.
- New dealers: Single application to be filed online for registration under GST.
- The registration number will be PAN based and will serve the purpose for Centre and State.
- Unified application to both tax authorities.
- Each dealer to be given unique ID GSTIN.
- Deemed approval within three days.
- Post registration verification in risk based cases only.

**C- Returns:** The major features of the proposed returns filing procedures under GST are as follows:

- Common return would serve the purpose of both Centre and State Government.
- There are eight forms provided for in the GST business processes for filing for returns. Most of the average tax payers would be using only four forms for filing their returns. These are return for supplies, return for purchases, monthly returns and annual return.
- Small taxpayers: Small taxpayers who have opted composition scheme shall have to file return on quarterly basis.
- Filing of returns shall be completely online. All taxes can also be paid online.

**D-Payments:** The major features of the proposed payments procedures under GST are as follows:

- Electronic payment process- no generation of paper at any stage
- Single point interface for challan generation- GSTN 12
- Ease of payment – payment can be made through online banking, Credit Card/Debit Card, NEFT/RTGS and through cheque/cash at the bank
- Common challan form with auto-population features
- Use of single challan and single payment instrument
- Common set of authorized banks
- Common Accounting Codes

**Conclusion :** GST, the biggest modification in India's indirect tax structure since the economy began to open up 25 years ago, at last looks set to become truth. We, the Indian expect lot of hopes from government regarding introduction and execution of GST in India. GST will instantaneously spur economic growth after accomplishment in India.

## FOREIGN DIRECT INVESTMENT: OPPORTUNITIES & CHALLENGES

**Prof. Dr. Satyam K. Sanap**

*Indrayani Mahavidyalaya Talegaon Dabhade.*

**Key Words:** F.D.I., Retail Sector, Foreign investment, Globalization, Growing Economy, Multinational Enterprises (MNEs).

**Introduction:** F.D.I. is an important stimulus for the economic growth of India. India founder member of WTO.WTO agreement includes wholesale and retailing services and all member countries are required to open up the retail trade sector to foreign investment. India is ranked as the third most attractive nation for retail investment, so India allows 51% FDI in multi-brand retail sector and 100% FDI in single-brand retail sector. This recent FDI policy in retail and multi-brand business will have both challenges and opportunities. Those who favour FDI argue that it will develop infrastructure like cold storage which will result into less wastage of agricultural produce. It will generate employment opportunities for both educated and un educated as educated people will directly be employed in MNC stores. The foreign money will come in to India which will strengthen our economy. Those who do not favour FDI in retail argue that it can make the small traders from the country disappear and later the MNCs can have their own monopoly in terms of deciding the price putting pressure on farmers in deciding the lower prices of products. The current brief paper reviews the challenges and opportunities of FDI before Indian economy.

**Definition of F.D.I. :** FDI is defined as the net inflows of investment (inflow minus outflow) to acquired a lasting management interest in an enterprises operating in an economy other than that of the investor.

**Significance:** India is developing country whose retail industry is largest industry. So, this policy can solve the problem of capital, employment and raw material also will get the opportunities to develop the economy by foreign retailer.

**Objective of Study:** This study will try to explore the following objectives:-

- To understand the concept of F.D.I.
- To study the Indian scenario of F.D.I.
- To study the challenges and opportunities before Indian economy.
- To give some suggestions for developing retail sector in India.

**Research Methodology:** The present study is of descriptive type. This research paper is mainly based on secondary data sources. The information has to be collected from different books, Journals, reference book, published data of RBI report, Magazines, Souvenir and Websites is used for the analysis.

**The Indian Scenario:** With a contribution of 14% to the national GDP and employing 7% of the total work force(only agriculture employs more) in the country, the retail industry is definitely one of the pillars of the Indian economy. India being a signatory to world trade organizations General Agreement on Trade in services, which include wholesale and retailing services, had to open up the retail trade sector to foreign investment.51% investment in a single brand retail outlet was permitted in 2006.The Union Cabinet on 24 November 2011 approved 51% foreign direct investment(FDI) in multi-brand retail. The cabinet also decided to raise the cap on foreign investment in single-brand retailing to 100% from 51% .An estimated Rs.30-lakh-crore retail sector was thus opened to foreign investors by clearing a bill that allows 51 per cent investment in multi-brand retail. India currently allows 51% foreign investment in single-brand retailers and 100 per cent for wholesale operations but no FDI in multi-brand retail.

**F.D.I. Opportunities in Indian Economy:**

**Employment Generation:-** The entry of multinational retailers will expand the market creating large amount of additional jobs in retail. The employment opportunities will be manager, logistics, sales etc.

**Availability of New Technology:-** Developed technology in the global of processing grading handling and packing of goods. Also technical developments in areas like electronic weighing billing, barcode scanning etc.

**Consumers Satisfaction:-** Indian consumer will find new world of enjoyment of picking up consumer items to their greatest satisfaction.

**Cheaper Production Facilities:-** FDI will ensure better operations in production cycle and distribution. Multinational retailers will often allow discounts on selected items. These items will facilitate the consumers. They can end up with marginal agreement.

**Healthy Competition:-** The many multinational corporation will obviously promise intensive competition between the different companies offering their brands in a particular product market and this will result in availability of many varieties reduced prices.

**Increase in Efficiency:-** To compete with foreign retailers and organized sector in India will have to work more efficiently. FDI environment will result in increase in their efficiency.

**Improvement in Status:-** Life style of living is changing very speedily because of availability of products from global market. This will enhance lifestyle of the consumer ultimately the status of the consumer will improve.

**Economic Growth:-** This is one the major sectors, which is enormously benefited from foreign direct investment. A remarkable in flow of FDI in various industrial units in India has boosted the economic life of country. Along with the above mentioned opportunities the following may be regarded as major common perceived benefits; capital infusion, improvement in supply chain, farmers advantages, stability ,reduce wastage of perishables, brand recognition etc.

**F.D.I. Challenges before Indian Economy:** The challenges facing FDI in India are in spite of the more than 100 of fortune 500 companies are already investing in India. In spite of the obvious advantages of FDIs, there are quite a few challenges facing larger FDIs in India, such as: The first challenge facing the organized retail sector is the competition from unorganized sector. The major challenges facing larger FDI, is the need to speed up the implementation of policies, rules, and regulations. Supermarkets will establish their monopoly in the Indian market. Work will be done by Indians profit will go to foreigners. The support of the political structure has to be there towards the investing countries abroad. This can be worked out when foreign investors put forward their persuasion for increasing FDI capital in various sectors. FDI will drain out the country's share of revenue of foreign countries which may cause negative impact on India's overall economy. Through FDI in India retail trading business will indirectly or directly contribute for the enhancement of tourism, hospitality and few other industries, the culture of the people in India will slowly be change. Lack of proper physical communication facilities. Shortage of desirable talent and lack of skilled manpower. The inefficiencies in the current supply chain and the presence of numerous intermediaries are difficult to curtail.

Along with the above mentioned opportunities the following regarded as major challenges; Risk and Uncertain, Challenge to sovereignty of nation, Workers are unsecured, profit distribution ration is not fixed. etc.

**Suggestions & Recommendations:** Providing industry status is the first basic step needed for reforming the Indian retail sector. The government can provide a single window clearance system. The single window clearance will further streamline license processes associated with the establishment. A reduction in the customs duties relating to consumer items would greatly channelize funds to boost the economy. Formulation of a Model Central Law regarding FDI of Retail Sector. Preparation of a legal and regulatory framework and enforcement mechanism to ensure that large retailers are not able to dislocate small retailers by unfair means.

**Conclusions:** F.D.I. is an important stimulus for the economic growth of India. FDI has helped to raise the output, productivity and employment in some sectors especially in service sector. We hope that the recent measures to open up the economy to FDI will make india a preferred destination and bridge the current account deficit.

## **A STUDY OF ROLE OF E-BANKING IN VARIES BANKING SERVICES**

**Prof. Nagpure Vijay Bhausaheb**

*C.D. Jain College of commerce, Shrirampur Dist- Ahmednagar*

**INTRODUCTION :** Internet banking (e-banking) is a remote service, where access to account information and any transactions is granted at any time from any computer with an Internet connection. Banks started proposing modern e-banking services only recently. An important question is how the conversion from plain vanilla banking to online one affects the bank customer's behavior. In this thesis we focus on whether it leads to more customer initiated transactions and higher amounts on balances. The result can arise via several channels: Thus, it can be concluded that bank customers are still not accustomed to using electronic channels to run their financial affairs. This low adoption rate is an indication of the hazards of introducing new products and services into the marketplace; the vast bulk of product and service innovations fail, at considerable cost to the companies introducing them. Moreover, those services perceived as necessary by such adopters must also be identified. E-banking has experienced strong and sustained growth. World Bank report on growing economy in e-finance pointed out that the three countries with impressive progress in information technology. The Internet has changed the operations of many businesses, and has been becoming a powerful channel for business marketing and communication American Banker. Applications E-banking has been viewed as an advanced upgrading from previous electronic delivery systems to open many new business opportunity for the banking industry. There have been several major challenges and issues faced to the e-banking growth and the e-business in general.

**ROLE OF E- BANKING IN VARIES BANKING SERVICES:** Indian banks offer to their customers following e-banking services : -

- A) Automated Teller Machines (ATMs)
- B) Mobile Banking
- C) SMS Banking
- D) Tele-Banking
- E) Internet Banking
- F) Phone Banking
- G) Electronic Clearing Services

**(A) Automated Teller Machines (ATMs) :** ATM is a computer driven system which is user friendly and operates 24 hours a day and 7 days a week. It is totally menu-driven, which displays step-by- step instructions for the customer. ATM can be accessed by a customer by using his ATM card to gain entry into the ATM room and the Personal Identification Number (PIN) for desired transactions. ATMs are install at banking premises (on-site ATMs) for which no license is required from RBI. For non-branch ATMs at public places (off-site ATMs), banks have to obtain license post facto. Many banks have opened off-site ATMs at airports, railway stations, petrol pumps, market centre's, universities etc.

**ATMS Alternative Uses:** - ATMs were originally developed as just cash dispensers. ATMs have been evolved to include -

1. bank-related functions. ATMs include many functions which are not directly related to the management of one's own bank account, such as: Deposit currency recognition, acceptance, and recycling.
2. Paying routine bills, fees, and taxes
3. Printing bank statements
4. Updating passbooks
5. Purchasing products.
6. Postage stamps.
7. Lottery tickets
8. Train tickets
9. Movie tickets

10. Games features
- 11.. Donating to charities
- 12.. Cheque Processing Module
13. Adding pre-paid cell phones / mobile phone credit

**Advantages of ATMs are:**

- 1) You can withdraw cash at any time, day or night. The banks don't need to be open.
- 2) Customer can choose his own time of banking at any time or any day of the week.
- 3) ATMs are faster than going to the bank—no long lines.
- 4) They offer quick and efficient service.
- 5) ATM card is protected by a PIN, keeping your money safe.
- 6) There is no scope for discourteous or subjective behavior as happens with human Interaction at a bank's counters.
- 7) Don't need to fill out withdrawal and deposit slips as is required at the bank.
- 8) ATMs offer the convenience of multiple locations. Withdraw cash at any bank that is part Of the system to which you're ATM card is linked.

**Dis -advantages of ATMs as follows :**

- 1) Cash withdrawals are restricted to certain amounts fixed by the bank and notified.
- 2) ATM may be off-line (system down).
- 3) Risk of robbery when you leave the ATM.
- 4) Cash dispensation is restricted to certain denomination of currency notes- usually
- 5) You may forget your PIN number.
- 6) Fees charged to use ATMs of other banks can become expensive.
- 7) The ATM can break down or run out of cash.

(B) **Mobile Banking :** Mobile banking, as the name indicates, is in contrast to the traditional brick and mortar banking which is done from a fixed branch premises where the customers have to go for transacting the desired banking transactions. Mobile banking tries to reach the customer to enable him/ her to transact banking. Mobile banking is used in two different senses. Banking through a mobile van (called mobile bank), with or without computerized banking system, which moves from one place to other on designated routes at designated hours and the customers can transact their routine banking, like cash deposit and withdrawals, draft issue, cheque collection, cheque book issue, pass book update etc.

**Mobile Banking Services:** Banks offering mobile access are mostly supporting some or all of the following services:

1. Account Balance Enquiry
2. Account Statement Enquiries.
3. Cheque Status Enquiry.
4. Cheque Book Requests.
5. Fund Transfer between Accounts.
6. Credit/Debit Alerts.
7. Minimum Balance Alerts.
8. Bill Payment Alerts.
9. Bill Payment.
10. Recent Transaction History Requests.
11. Information Requests like Interest Rates/Exchange Rates.

**Advantages of Mobile Banking:** In Mobile banking, the user can transfer funds from your bank account to another bank account with a Smartphone just with the help of the internet, from anywhere to everywhere. It is available for 24 hours and easy and convenient mode for many Mobile users in the rural areas. Mobile Banking is said to be more secure and risk-free than online Internet Banking. With the help of Mobile, Banking user can transfer funds, and pay bills, checking account balance, study your recent transaction, block your ATM card, etc. Mobile Banking is cost-effective, and Banks offer

this service at less cost to the customers. You can transfer money instantly to another account in the same bank using mobile banking. The service provided by bank is free of charge, there is no limit for number of times you can access your account.

**Disadvantages of Mobile Banking` :** Mobile Banking is not available on all mobile phone. it requires you to install apps on your phone to use the Mobile Banking feature which is available on the high-end Smartphone. If the customer does not have a Smartphone than the use of Mobile Banking becomes limited. A transaction like transfer of funds is only available on high-end phones. Regular use of Mobile Banking may lead to extra charges levied by the bank for providing the service. Mobile banking users are at risk of getting fake SMS messages and scams. When a mobile banking user receives a fake text message asking for bank account details from a hacker. There are also very limited anti-virus software options for mobile devices.

The loss of a mobile customer device often means that criminals can gain access to your mobile banking PIN and other sensitive information.

**(C)SMS banking:** SMS banking is a technology-enabled service offering from banks to its customers, permitting them to operate selected banking services over their mobile phones using SMS messaging. Individuals or customers can manage their bank accounts, check their account balances, money transfers, paying bills and perform other banking transactions using their mobile phones. There are two methods of SMS widely used in applications; they are the PUSH & PULL. Push messages are those that bank chooses to send to a customer's mobile phone, without the customer initiating a request for the information. It is a one way message. Typically push messages could be either mobile marketing messages or messages alerting an event which happens in the customer's bank account, such as a large withdrawal of funds from the ATM or a large payment using the customer's credit card, etc

**(A) Tele- Banking** Tele-banking refers to banking on phone services a customer can access information about his/her account through a telephone call and by giving the coded Personal Identification Number (PIN) to the bank. Tele-banking is extensively user friendly and effective in nature. To get a particular work done through the bank, the users may leave his instructions in the form of message with bank. Facility to stop payment on request. One can easily know about the cheque status. Information on the current interest rates. Information with regard to foreign exchange rates. Request for a DD or pay order. D-Mat Account related service.

**E) Internet Banking:** Internet has an ever-growing importance in the banking sector because of the advantages it brings to both the entities and their customers, not all the financial entities that have adopted e-banking have been successful. One can do online fund transfer using real time gross settlement from one bank account to another from home without going anywhere and hence it saves lot of time and energy of the account holder. The customer does not have to stand in long queues because internet banking provides the customer with majority of services which is available in normal banking operations. Apart from banking services one can use internet banking for many things like booking railway ticket.

**F) Phone Banking:** The terms Mobile Phone banking and mobile banking (M-Banking) are used interchangeably. The term M-Banking is used to denote the access to banking services and facilities offered by financial institutions such as account-based savings, payment transactions and other products by use of an electronic mobile device. Mobile banking has yielded a multiple effect on the number of solutions available to clients. This is in addition to more efficient transactional environment and the high substitution of banking points.

**G) Electronic Clearing Services:** ECS is an electronic mode of funds transfer from one bank account to another. It can be used by institutions for making payments such as distribution of dividend interest, salary, pension, among others. It can also be used to pay bills and other charges such as telephone, electricity, water or for making equated monthly installments payments on loans as well as SIP investments. ECS can be used for both credit and debit purpose.

**Conclusion:** Customers are increasingly moving away from the confines of traditional branch-banking and are seeking the convenience of remote electronic banking services. The role of technology is increasing day by day. Digital banking denotes the provision of banking and related services through extensive use of information technology without direct resource the bank by the customer. The various sectors of India are growing at much

faster rate with the help of technology. The origin of virtual banking in the developed countries can be traced back to the 1970's with the installations of Automated Teller Machines. In addition to it, shared ATM networks. Mobile banking is also a big mobile telecommunication platform of new technology, which promotes the banking functions in India. Mobile banking also helps the banks to increase their customers. Today, everyone has a mobile phone in his hands. The number of mobile users in India got second position in the world. The increasing frequency of mobile internet users gives the boost energy to the mobile banking. This paper explores the importance of Internet banking, mobile banking, Phone banking, tele-banking, sms-banking, ECS in the new era of technology which helps the banking industry to grow at higher speed. They are trying to utilize the information technology for banking business and provide technology based banking products and services to their customers.

## **E-BANKING PROBLEM AND PROSPECTUS IN INDIA**

**A.B.Bodake**

Asst.Prof .Department of Commerce, G.D.Sawant Art's Commerce Sci. & B.C.S. College Nashik- 10

**Introduction:** E-Banking is the banking of new era. Term E-Banking refers the use of internet for banking activity. Today internet banking play vital role in business financial activity .The new information technology is becoming an important factor in the future development of financial services industry, and especially banking industry. The customar system of banks in the instalment advancements is focused technique expecting to contend based on estimate. Manages an account with across the board branch systems grade to catch a bigger number of clients than those with less divisions. After globalization international exchanging developed purposely. Electronic banking (E-Banking) has been provide as a solution and started with the use of software. Now a day internet widely influence on banking transaction. In short bank has utilizing hardware and media transmission systems for giving and growing new age services to the client.The ICICI Bank commenced web based managing an account in 1996. Right now 78% of its client base is enlisted for internet saving money

### **Objective of the paper**

- 1) To understand the Process of E-Banking
- 2) To Study the Emerging trends in E-Banking.
- 3) To understand the Problem and prospects of E-Banking

**Research Methodology :** For the said research data to the above objective was collected by the the review of the literature on the subject concerned. The literature was thus collected by visiting libraries and various concern websites. The present research study is based on the secondary data .such secondary data is collected from various reference books on E-Banking, New technology etc.

**Review of letreture: Rashmi Sharma:** Discuss the various services provide by the banking sector to the customer. The advent and expansion of globalization and the development of new newline technologies forced the banks to launch new channels to gain competitive newline advantage, reduce their costs, improve their financial services, enlarge their newline customer databases, progress their financial positions through innovative newline products and boost their general customer loyalty. Today, banks are switching newline to multi-channel distribution of financial services through Internet

**Ruby Shukla& Pankaj Shukla(2011)** the paper review E-Banking offers a higher level of convenience for managing one's finance even from one's bedroom. However, it continues to present challenges to the financial security and personal privacy. Many people have had their account details compromised, as a result of online banking. Awareness of the risks and problems enables him to take precautions for a more secured online banking experience

**Concept of E-Banking:** Online banking, also known as internet banking, e-banking or virtual banking, is an electronic payment system that enables customers of a bank or other financial institution to conduct a range of financial transactions through the financial institution's website. The online banking system will typically connect to or be part of the core banking system operated by a bank and is in contrast to branch banking which was the traditional way customers accessed banking services. Sometimes Internet banking is defined as a subset of PC banking, which also includes online banking. In contrast to Internet banking, online banking refers to bank transactions within closed networks (Deutsche Bundesbank, 2000).

**Process of E-Banking** To access a financial institution's online banking facility, a customer with internet access will need to register with the institution for the service, and set up a password and other credentials for customer verification. The credentials for online banking is normally not the same as for telephone or mobile banking. Financial institutions now routinely allocate customers numbers, whether or not customers have indicated an intention to access their online banking facility. Customer numbers are normally not the same as account numbers, because a number of customer accounts can be linked to the one customer number. Technically, the customer number can be linked to any account with the financial institution that the customer controls, though

the financial institution may limit the range of accounts that may be accessed to, say, cheque, savings, loan, credit card and similar accounts. The client visits that monetary institution's secure website, Also enters those online banking utilizing the client amount Furthermore accreditations formerly set up. Those sorts for monetary transactions which a client might transact through online banking are dictated Toward those fiscal institution, Anyway normally incorporates acquiring record balances, An rundown of the late transactions, electronic bill instalments Furthermore stores transfers the middle of An customer's or another's accounts.

**Different form of E-Banking** There are various form to use net banking as per the need and the availability of modem.

### Problem Related with E-Banking

#### ➤ **Low Awareness about Internet Banking**

Most of common people did not have full knowledge of online banking . they didn't get the proper knowledge and proper information about online banking.

➤ **Absence of trust:** Still numerous clients don't trust online method of administration particularly for cash related exchanges. Clients who are not prepared in e-saving money feel exceptionally awkward as they have question with respect to the accuracy of the exchange done by them on the web. As they require some sort of evidence of exchange as receipt, to confirm their exchanges..

➤ **Impersonal:** Absence of up close and personal communication makes it extremely indifferent. Along these lines, clients who are more agreeable in managing individuals in physical bank setting that give those customized benefits instead of mechanical communication; e-saving money isn't a decent alternative for them

➤ **Difficult for first time Users:** For the beginners, it appears as a complex mode of service as customer find it complicated to navigate through bank's website. While opening an account online, bank's website requires a number of information and that seems time taking and inconvenient process to the first time users.

➤ **Security extortion:** People for the most part waver to have an online financial balance because of the security hazard engaged with it. In spite of the fact that, it isn't a major issue for banks giving e-saving money administrations, as they organize security. To stay away from security hazard, banks utilize the most developed security framework in ensuring their sites

#### ➤ **Lower Internet Speed and users**

India has one of the lowest internet connectivity rates in Asia as compare to Taiwan, japan, and Singapore and also lower use of internet , bt in metro city such as Mumbai,chennai, Pune, Banglore have much better Internet connectivity than other city

➤ **Security Issues:-** At the time of online payment or transferring amount from one account to other account ,the online bankers are always concerned about the hackers and anti- social elements, hacking enables the unethical hackers to break in the accounts of online bankers, and misuse their money

#### ➤ **Customer Care Services**

At the time of online transactions various time banker might need bank representative, From the bank, but in online banking, bank provide customer care number it is Difficult to connect and talk with customer care

**Conclusion** E-Banking provide 24 hrs. Services as per our time. In India after *demonetisation* of currency in 2016 E-banking use is rapidly growing .However it is continuous challenges for financial security and personal

privacy. Rapid growth of net banking use create security problem. E-Banking offers a more elevated amount of accommodation for overseeing one's accounts even from one's room. In any case, it keeps on introducing difficulties to the money related security and it is also necessary to understand the rights and responsibilities as a customer, in order to make a difference to one's own financial well-being. To create Awareness of the risks and problems among the customer enables him to take precautions for a more secured online banking experience.

## DEMOGRAPHIC DIVIDEND OF INDIA: CHALLENGES AND MEASURES

Dr. Ganesh Raghunath Jaitmal

Asst. Professor, PG Department of Economics, S.N.Arts, D.J.M. Commerce & B.N.S.Science College, Sangamne, Tal. Sangamner, Dist. Ahmednagar: 422 605

**1. Introduction** The population is vital from the point of economic growth and resources of the country. India's population is rising geometrically where as production rises arithmetically, according to 2011 census the population is about 121 cores. The population, which accounts for world's 17.5 per cent population, comprises 623.7 million males and 586.5 million females. The country's headcount is almost equal to the combined population of the United States, Indonesia, Brazil, Pakistan, Bangladesh and Japan. The population has increased by more than 181 million during the decade 2001-2011, the report said. The growth rate in 2011 is 17.64 per cent in comparison to 21.15 per cent in 2001. The 2001-2011 periods is the first decade - with exception of 1911-1921 - which has actually added lesser population compared to the previous decade. The median age of India in 2011 was a young 24 years, with the median age ranging from 19 years in Meghalaya, 20 in Bihar and UP to 31 years in Kerala. This is good news for India as even its most aged state is still younger than China or the United States. Following age pyramid will express an idea about age structure of India in 2011.

Fig.1 India's Age Structure in 2011

Source: <http://catalyst.nationalinterest.in/2013/09/09/the-age-of-india/#lightbox/2/>

Change in demographic features of any nation matters a lot to define the nation's fate in future. Being one of the important factors as human resource its features affect socio-economic development of the county. More youth people in a country create more working force to the nation and it means there remains lower level of dependency ration in the county. Consequently, countries can engage this human resource to augment its productive capacity. If sensibly utilized, this can raise per capita income level of the country which pulls up the country to substantially higher living standards. However, if the efforts are not made to utilize the youth resource properly then it will turn to the demographic nightmare to the nation. Huge youth unemployment is the surest way to social tension, unrest, and unlawful activities. Hence to understand India's readiness in this aspect we must look at the issue of education, skill formation and employment among youth in India.

**2. Concept of Demographic Dividend** Demographic factors have reappeared in the economic development debate with the emergence of the concept of the "Demographic Dividend". After the neo-Malthusian onslaught on the detrimental effect of rapid population growth on all aspect of development in the second half of the century, the beneficial aspect of population growth has perhaps been sidelined in the development discourse. However, the current changes in the age structure bring population parameters back into the growth debates.

Demographic dividend, as defined by the United Nations Population Fund (UNFPA) means, “the economic growth potential that can result from shifts in a population’s age structure, mainly when the share of the working-age population (15 to 64) is larger than the non-working-age share of the population (14 and younger, and 65 and older).” In other words, it is “a boost in economic productivity that occurs when there are growing numbers of people in the workforce relative to the number of dependents.” UNFPA stated that, “A country with both increasing numbers of young people and declining fertility has the potential to reap a demographic dividend. The demographic dividend is defined as a rise in the rate of economic growth due to a rising share of working age people in a population. This phenomenon occurs with a falling birth rate and consequent shift in the age structure of the population towards the adult working ages. It is also commonly known as the demographic gift or bonus or demographic window. With many developing countries particularly in the Asian continent experiencing a rapid decline in fertility, there has been overwhelming optimism that the demographic bonus will take these countries to greater economic heights.

**3. Objectives of the study** Following are the objective of the study

- 1) To study the concept of Demographic Dividend
- 2) To find out the challenges for the benefits of demographic dividend in front of India
- 3) To suggest measures for the benefits of demographic dividend in India.

**4. Research Method and data collection** For this research paper descriptive study method has been used. Secondary data collection technique was implemented to collect necessary information. The data used in this study has been collected from different websites, blogs, newspapers, articles, reference books, and published research papers.

### **5. Review of Literature**

- Mujumdar (2013), In her research paper stated that formal educational standard of the Indian youth is not remarkable. Just 40 per cent have secondary or higher secondary level of education while less than 8 per cent have graduate degree or post graduate training, more than 17 per cent are illiterate. More than 70 per cent of the youth have left studies before completing the highest stage of study. Most remarkably there is a gender bias also with rural youth and young woman lagging far behind the urban or male counterparts in education and training. Of the total 275 million youth population in India, 102 million youth are active in the labor market. More than 22 per cent of these youth are currently unemployed, with another 5 per cent being casual laborer and 13 per cent being self-employed. Just about 60 per cent of such high skilled youth have any regular salaried job.
- Aiyer Shekhar and Ashoka Mody (2011), Stated in their research paper that demographic dividend played a pivotal role for the evolution of the age distribution in the economic performance of leaders and laggards among Indian states. Tamil Nadu, Karnataka and Gujarat, among the best performing Indian states in recent times, have also reaped an enormous demographic dividend. The states in the south and west of India have already undergone the major part of their demographic transition, while the laggards have not.
- Paul et al (2008) found out that the distribution of the educational levels for the age group of 15-34, taking districts as a unit, unraveled the contrast in educational attainment. The bulge of youth population in India, educational attainments cannot match the requirements of ever sprawling global labor market.
- According to Ramdas (2012), there are some characteristics of employment growth in recent years. 1) Employment rate has decelerated. 2) Employment context of growth has shown a decline trend. 3) Sectors of higher employment potential have registered relatively slower growth. 4) Agriculture, despite a sharp decline in its importance in GDP, continues to be the largest employer as the non-agricultural sectors have not generated enough employment to affect a shift of workforce.
- Ghatak (2010), addressed that India’s present population in the working age group has raised the importance of discussing health issue for the sustainable of economic growth realized in terms of the benefit of demographic dividend. Higher growth evidently improves health outcomes while better health outcomes in turn raise economic growth.

### **6. Demographic Dividend in India:**

- Census 2011 data shows that India’s working age population (15-64 years) is now 63.4% of the total population, as against just short of 60% in 2001. In 2015, it is 52.45 (per 100 populations 15-64).
- The numbers also show that the ‘dependency ratio’ - the ratio of children (0-14) and the elderly (65-100) to those in the working age - has shrunk further to 0.55.

- India's median age has risen from around 22 years in 2001 to over 24 years in 2011.
- India is poised to become the world's youngest country by 2020, with an average age of 29 years, and account for around 28% of the world's workforce.
- In comparison, during the same period, the average age is expected to be 37 years in China and the US and 45 years in Western Europe.
- The International Labour Organization (ILO) has predicted that by 2020, India will have 116 million workers in the work-starting age bracket of 20 to 24 years, as compared to China's 94 million. In 20 years the labour force in the industrialized world will decline by 4%, in China by 5%, while in India it will increase by 32%.
- IMF, in 2011, reported that India's demographic dividend has the potential to add 2 percentage points per annum to India's per capita GDP growth over the next two decades.

#### **7. Four mechanisms for growth in the demographic dividend**

During the course of the demographic dividend there are four mechanisms through which the benefits are delivered.

1. The first is the increased labor supply. However, the magnitude of this benefit appears to be dependent on the ability of the economy to absorb and productively employ the extra workers rather than be a pure demographic gift.
2. The second mechanism is the increase in savings. As the number of dependents decreases individuals can save more. This increase in national savings rates increases the stock of capital in developing countries already facing shortages of capital and leads to higher productivity as the accumulated capital is invested.
3. The third mechanism is human capital. Decreases in fertility rates result in healthier women and fewer economic pressures at home. This also allows parents to invest more resources per child, leading to better health and educational outcomes.
4. The fourth mechanism for growth is the increasing domestic demand brought about by the increasing GDP per capita and the decreasing dependency ratio.

**8. Challenges for the benefits of demographic dividend** India currently has the largest set of young people, the issue is that a disturbingly large portion of this group is either totally unemployed or only partially employed and that also primarily in the unorganized sector. This is due to a variety of factors including skills shortage and lack of jobs. It is not hard to see the implications if this young population is not given jobs and thereby an opportunity for a respectable way of living. Apart from the lost opportunity in terms of GDP growth and rise in economic activity, this potentially entails social unrest that could have a negative knock on effect of India's positive growth outlook. The United Nations International Labor Organization (ILO) released its 2017 World Employment and Social Outlook report, which finds economic growth trends lagging behind employment needs and predicts both rising unemployment and worsening social inequality throughout 2017. Report states that unemployment in India is projected to increase from 17.7 million last year to 17.8 million in 2017 and 18 million next year. In percentage terms, unemployment rate will remain at 3.4 per cent in 2017-18. Therefore unemployment is become the foremost hurdle to rip the benefit of demographic dividend. Another challenge is lack of better educational facilities in all over India. This is one of the important aspects that Indian government has to look into. Majority of India still lives in villages and so the topic of rural education in India is of utmost importance. A survey named called the Annual Status of Education Report (ASER), shows that even though the number of rural students attending schools is rising, but more than half of the students in fifth grade are unable to read a second grade text book and are not able to solve simple mathematical problems. It is also important that whatever human resources we have, they must be well educated and have good knowledge about what they are doing.

Availability of skilled person is also a major issue to avail the benefits of demographic dividend. Most of the Indian people are in the unorganized sector and not possessing any kind of skill. It is obviously, they have to work on low wage rate and under the pressure of job security. The quality of vocational training is weak too. In last decade, the number of private ITIs increased from 2,000 to about 10,000 in 2013, but there are concerns about the quality of its trainees. There is unavailability of more number of training institutes in India, unawareness about to develop skill and absence of any strong policy regarding this leads to the wastage of human resources. After Independence there has been a significant improvement, in the health status of people.

But the situation is not much better as per study of WHO. It has placed India in 112th position among 191 countries of the world. A serious drawback of India's health service is the neglect of rural masses. It is largely a service based on urban hospitals. Although, there are large no. of PHC's and rural hospitals yet the urban bias is visible. According to health information 31.5% of hospitals and 16% hospital beds are situated in rural areas where 75% of total population resides. Expenditure on health by the Government continues to be low. Almost everywhere, the poor suffer poor health and the very poor suffer appallingly. For the contribution in the economic development of a nation, human resource must be healthy. Corruption is an issue that adversely affects the country's economy and the credibility of central, state and local government agencies. Not only has it held the economy back from reaching new heights, but rampant corruption has stunted India's development. A study conducted by Transparency International in 2005 recorded that more than 92% of Indians had at some point or another paid a bribe to a public official to get a job done. Transparency International's 2016 Corruption Perception Index ranks the country 79th place out of 176 countries. This menace has to curb as early as possible to get the benefits of demographic dividend. Infrastructure is a key driver of the overall development of Indian economy. It has a domino effect on the other sectors of the economy as it helps improve productivity by removing infrastructural bottlenecks, which impede economic growth. Decades of underinvestment have left the country with dire deficits in critical areas, such as railways, roads, ports, airports, electricity and water. In the World Economic Forum's Global Competitiveness Report for 2013-14, India ranked 85 out of 148 countries for infrastructure. Infrastructure development can be the hurdle to have the advantages of demographic dividend. There is a need for India to closely examine the norms that allow violence and a broader pattern of gender discrimination to continue. The gender gap holds back economies all around the world. Any society that does not value women as much as men is not reaching its full potential. It is hoped that economic growth would help drag the Indian poor above the poverty line. However, so far economic growth has been highly uneven benefiting the skilled and wealthy disproportionately. Many of India's rural poor are yet to receive any tangible benefit from the India's economic growth. More than 78 million homes do not have electricity. 33% (268million) of the population live on less than \$1 per day. Agriculture produces 17.4% of economic output but, over 51% of the work forces are employed in agriculture. This is the most inefficient sector of the economy and reform has proved slow.

Considering all these challenges, if India wants to get all the fruits of demographic dividend of demographic transition, it has to be quick enough for policy making and implementation of effective measures or else this demographic transition will create socio, economic and political problems for the economy.

**9. Measures for the benefits of demographic dividend** Indian is now undergoing demographic transition and it is an opportunity to capitalize on the demographic dividend offered by the maturing of formerly young populations. The demographic dividend is not, however automatic. Given the right kind of policy environment, this demographic dividend will help to produce a sustained period of economic growth, as it did in several East Asian economies. India needs to create 1 million jobs every month to be able to provide employment for the population entering working age group and for those moving out of agriculture. Further, the job creation has to be specific to the needs to Indian population. As young people and agriculturalists enter the workforce, they would need low and medium skilled jobs. India's relatively undeveloped manufacturing sector has to create the jobs for this group. The employment intensity in service sector is anyways less as compared to manufacturing sector. The manufacturing sector has to thus be the driver of job creation. Government has undertaken some measures to impart skills to the Indian workforce to reap the benefits of demographic dividends. Major challenge of skill development initiatives is also to address the needs of huge population by providing skills in order to make them employable and help them secure decent work. The overall quality of the higher education system is well below global standards. High-tech employers complain that a large majority of engineering and other graduates are unemployable. The large high-tech firms such as IBM, Infosys and Wipro have set up their own in-house academies to prepare employees for productive work. The health care facilities are not properly implemented. Though we have various health care plans in India but still they are not properly implemented. Proper strategies for healthcare are must in order to not to turn demographic transition into a demographic catastrophe. Infrastructure, in general, defines as a set of facilities through which goods and services are provided to the public. Infrastructure is the stock of basic facilities and capital equipment needed for the functioning of a country or area; the term to refer collectively to the roads, bridges, rail lines, and similar public

works that are required for an industrial economy, or a portion of it, to function. GDP growth averaging 9% per year can be achieved only by overcoming infrastructure deficit. Additionally, we should explore one of the many public-private partnership (PPP) models, such as Build-Own-Operate-Transfer (BOOT) or Design-Build-Finance-Operate-Transfer (DBFOT) model, to build key infrastructure in the country. We have multiple successful examples of PPP models in major areas including healthcare, infrastructure and education. Therefore this area needs to be cared for the benefits of demographic dividend. Building political consensus around agriculture is an important for the economy. As India moves forward on the shoulders of its young demographics, it is inconceivable that we leave half the population to survive on less than a fifth of its GDP. The solution is to deliver greater returns to the farmer through the reform in agriculture sector.

Early investment in social development is required for the realization of demographic dividend by creating conditions conducive to fertility decline and thus to growth in the size of the labor force and improvements in its quality. This will lead to have healthier young adults in our workforce. According to the Human Development Report (HDR) published by the United Nations Development Programme (UNDP), India is still in the medium human development category with countries like China, Sri Lanka, Thailand, Philippines, Egypt, Indonesia, South Africa, and even Vietnam has a better rank. Therefore health and education parameters need to be improved substantially to make the Indian workforce efficient and skilled. The successful implementation of good governance nurtures a development dividend. Administrative changes and decentralization, transparency in each department, anticorruption strategies, and strategic assistance with multilateral organization are some of the matters in which the government has to look deliberately to achieve demographic dividend. Rule of law is connected with poverty reduction, development of human capital, in rendering gender equality, decentralization and economic development is the key element for good governance and peace building. Government seems serious about harnessing the potential of demographic dividend through development of skills. However, more holistic measures are needed to make the Indian work force not just economically competitive but also efficiently competitive. Moreover, measures should have pan Indian presence and not just concentrated in metropolitan cities as most of the workforce is likely to come from the rural hinterland. It will not just help in increasing the economic development but will also help in curbing the regional and social inequalities.

**10. Conclusion** A sizeable part of India's growth velocity since the 1980s can be attributed to demographic change. Looking ahead, the continuing demographic transition will yield a growth dividend of about 2 percent per annum over the next two decades. Demographic change in India is opening up new economic opportunities. So if we want to take advantages of this working age group, we should pay attention on quality of education, increase job opportunities and skill development programme. With the help this programme and policy we can able to get maximum benefit of the young age group. If we enhance the quality of education with appropriate structure and policy, it will directly help us to get advantages of this working age group. To enhance the employment opportunities, adequate growth of investment in both domestic and foreign, investment in the non-formal segment and proper combination of output growth is required in order to lead to a high employment growth. We can also reduce barriers like position of women in society, low level of literacy, less work participation, low incomes and extremely uneven distribution of assets against balanced economic growth. However, keeping the above factors in mind, in order to reap the benefits of demographic dividend the policymakers along with the private participation have to move on the path of sustained socio economic development.

## **GOODS AND SERVICES TAX (GST) IN INDIA : ISSUES AND PROSPECTS**

**Dr. Bhausaheb .Y. Deshmukh**

*(Associate Professor & Head ,Dept. of Economics  
Adv.M.N.Deshmukh Arts,Sci.& Comm.College Rajur, Tal-Akole,Dist- A-Nagar, (MS)*

**Introduction** “Goods and Service Tax (GST) is a comprehensive tax levy on manufacture, sale and consumption of Goods service at a national level.GST is a tax on goods and services with value addition at each stage having comprehensive and continuous chain of set-of benefits from the producer’s/ service provider’s point up to the retailer’s level where only the final consumer should bear the tax.” Introduction of a GST to replace the existing multiple tax structures of Centre and State taxes is not only desirable but imperative in the emerging economic environment. Increasingly, services are used or consumed in production and distribution of goods and vice versa. Separate taxation of goods and services often requires splitting of transaction values into value of goods and services for taxation, which leads to greater complexities, administration and compliances costs. Integration of various taxes into a GST system would make it possible to give full credit for inputs taxes collected. GST, being a destination-based consumption tax based on VAT principle, would also greatly help in removing economic distortions and will help in development of a common national market. Introduction of Goods and Services Tax (GST) will indeed be an important perfection and the next logical step towards a widespread indirect tax reforms in India. Initially, it was conceptualized that there would be a national level goods and services tax, however, with the release of First Discussion Paper by the Empowered Committee of the State Finance Ministers on 10.11.2009, it has been made clear that there would be a “Dual GST” in India, i.e. taxation power lies with both by the Centre and the State to levy the taxes on the Goods and Services. Almost 150 countries have introduced GST in some form since now. While countries such as Singapore and New Zealand tax virtually everything at a single rate, Indonesia has five positive rates, a zero rate and over 30 categories of exemptions. In China, GST applies only to goods and the provision of repairs, replacement and processing services. GST rates of some countries are given below :-

### **Country Rate of GST**

Australia	10%
France	19.6%
Canada	5%
Germany	19%
Japan	5%
Singapore	7%
Sweden	25%
New Zealand	15%

In India, government proposed the GST rate at 27% which is well above the global average of 16.4% for similar taxes. But, Our Finance Minister, Mr. Arun Jaitley told lawmakers that the proposed rate is too high and needed to be much more diluted. But some states are asking for an even higher rates for GST. Exemptions and exceptions have also been worked into the GST bill. This tax does not apply to alcohol and petroleum products. These will be taxed separately at first. And manufacturing states will be allowed to levy an additional tax of 1% on supply of goods. World over in almost 150 countries there is GST or VAT, which means tax on goods and services. Under the GST scheme, no distinction is made between goods and services for levying of tax. In other words, goods and services attract the same rate of tax. GST is a multi-tier tax where ultimate burden of tax fall on the consumer of goods/services. It is called as value added tax because at every stage, tax is being paid on the value addition. Under the GST scheme, a person who was liable to pay tax on his output, whether for provision of service or sale of goods, is entitled to get input tax credit (ITC) on the tax paid on its inputs.

**Needs And Objectives of Implementing GST In India** One of the main objective of Goods & Service

Tax(GST) would be to eliminate the cascading effects of taxes on production and distribution cost of goods and services. The exclusion of cascading effects i.e. tax on tax will significantly improve the competitiveness of original goods and services in market which leads to beneficial impact to the GDP growth of the country. It is felt that GST would serve a superior reason to achieve the objective of streamlining indirect tax regime in India which can remove cascading effects in supply chain till the level of final consumers.

#### BENEFITS OF GST:-

**GST will end cascading effects:-** This will be the major contribution of GST for the business and commerce. At present, there are different state level and center level indirect tax levies that are compulsory one after another on the supply chain till the time of its final consumption.

**Growth of Revenue in States and Union:-** It is expected that the introduction of GST will increase the tax base but lowers down the tax rates and also removes the multiple point taxation. This will lead to higher amount of revenue to both the states and the union.

**Reduces transaction costs and unnecessary wastages:-** If government works in an efficient mode, it may be also possible that a single registration and a single compliance will suffice for both SGST and CGST provided government produces effective IT infrastructure and integration of states level with the union.

**Eliminates the multiplicity of taxation:-** One of the great advantages that a taxpayer can expect from GST is elimination of multiplicity of taxation. The reduction in the number of taxation applicable in a chain of transaction will help to reduce the paper work and clean up the current mess that is brought by existing indirect taxation laws.

**One Point Single Tax:-** Another feature that GST will hold is it will be 'one point single taxation'. This also gives a lot of comforts and confidence to business community that they would focus on business rather than worrying about their taxation that may crop at later stages. This will help the business community to decide their supply chain, pricing modalities and in the long run helps the consumers being goods competitive as price will no longer be the function of tax components but function of sheer business intelligence and innovation.

**Reduces average tax burdens:-** Under GST mechanism, the cost of tax that consumers have to bear will be certain and it is expected that GST would reduce the average tax burdens on the consumers.

**Reduces the corruption:-** It is one of the major problems that India is overwhelmed with. We cannot expect anything substantial unless there exists a political will to root it out. This will be a step towards corruption free Indian Revenue Services.

Present CST will be removed and need not to be paid. At present there is no input tax credit available for CST. There are many indirect taxes in state and central level currently, which will be included by GST. i.e. you need to pay a single GST instead of all of them. Uniformity of tax rates across the states Ensure better compliance due to aggregate tax rate reduces. By reducing the tax burden the competitiveness of Indian products in international market is expected to increase and there by development of the nation. Prices of goods are expected to reduce in the long run as the benefits of less tax burden would be passed on to the consumer.

**GST - Salient Features** It would be applicable to all transactions of goods and service.

It to be paid to the accounts of the Centre and the States separately. The rules for taking and utilization of credit for the Central GST and the State GST would be aligned. Cross utilization of ITC between the Central GST and the State GST would not be allowed except in the case of inter-State supply of goods. The Centre and the States would have concurrent jurisdiction for the entire value chain and for all taxpayers on the basis of thresholds for goods and services prescribed for the States and the Centre. The taxpayer would need to submit common format for periodical returns, to both the Central and to the concerned State GST authorities. Each taxpayer would be allotted a PAN-linked taxpayer identification number with a total of 13/15 digits.

**Chargeability of Tax Under GST** It will be replacement of ED and other taxes. There will be two parallel Statutes – one at the Centre and other under the respective State GST Act – governing the tax liability of the same transaction. All the items of goods and services are proposed to be covered and exemptions will be granted to few selected items. After introduction of GST, all the traders will be paying both the types of taxes i.e. CGST and SGST.

**Taxevents** Following questions arises:

- At what point of time, the tax will be levied?
- Will TE covers both i.e. supply of goods and rendering of services?

- What will be the nature of TE?
- Will it not involve new language and terminology?
- What impact the change in TE can have?
- GST is proposed to be levied by both the CG and SGs. How will it be defined under CGST and SGST?

#### **Taxable persons**

- It will cover all types of person carrying on business activities, i.e. manufacturer, job-worker, trader, importer, exporter, all types of service providers, etc.
- If a company is having four branches in four different states, all the four branches will be considered as TP under each jurisdiction of SGs.
- All the dealers/ business entities will have to pay both the types of taxes on all the transactions.
- A dealer must get registered under CGST as it will make him entitle to claim ITC of CGST thereby attracting buyers under B2B transactions.
- Importers have to register under both CGST and SGST as well.

**Impact of Goods and Service Tax:-** Food Industry: The application of GST to food items will have a significant impact on those who are living under subsistence level. But at the same time, a complete exemption for food items would drastically shrink the tax base. Food includes grains and cereals, meat, fish and poultry, milk and dairy products, fruits and vegetables, candy and confectionary, snacks, prepared meals for home consumption, restaurant meals and beverages. Even if the food is within the scope of GST, such sales would largely remain exempt due to small business registration threshold. Given the exemption of food from CENVAT and 4% VAT on food item, the GST under a single rate would lead to a doubling of tax burden on food. Housing and Construction Industry: In India, construction and Housing sector need to be included in the GST tax base because construction sector is a significant contributor to the national economy. FMCG Sector: Despite of the economic slowdown, India's Fast Moving Consumer Goods (FMCG) has grown consistently during the past three, four years. Implementation of proposed GST and opening of Foreign Direct Investment (F.D.I.) are expected to fuel the growth and raise industry's size. Rail Sector: There have been suggestions for including the rail sector under the GST umbrella to bring about significant tax gains and widen the tax net so as to keep overall GST rate low. This will have the added benefit of ensuring that all inter-state transportation of goods can be tracked through the proposed Information technology (IT) network. Financial Services: In most of the countries GST is not charged on the financial services. Example, In New Zealand most of the services covered except financial services as GST. Under the service tax, India has followed the approach of bringing virtually all financial services within the ambit of tax where consideration for them is in the form of an explicit fee. GST also include financial services on the above grounds only. Information Technology enabled services: To be in sync with the best International practices, domestic supply of software should also attract G.S.T. on the basis of mode of transaction. Hence if the software is transferred through electronic form, it should be considered as Intellectual Property and regarded as a service. And if the software is transmitted on media or any other tangible property, then it should be treated as goods and subject to G.S.T. Implementation of GST will also help in uniform, simplified and single point Taxation and thereby reduced prices. Impact on Small Enterprises: There will be three categories of Small Enterprises in the GST regime.

- (a) Those below threshold need not register for the GST
- (b) Those between the threshold and composition turnovers will have the option to pay a turnover based tax or opt to join the GST regime,
- (c) Those above threshold limit will need to be within framework of GST.

Possible downward changes in the threshold in some States consequent to the introduction of GST may result in obligation being created for some dealers. In this case considerable assistance is desired. In respect of Central GST, the position is slightly more complex.

**Issues Arising while Implementing GST In India:** The problem with implementing Goods & Services Tax (GST) can be broadly classified into two major categories. Logistics: GST has to be implemented simultaneously by the Central & State Government. And, here Central govt can only provide the proverbial carrot but doesn't have the stick since it doesn't have constitutional authority to levy the tax without States acceptance, and hence its pretty much at the individual State's mercy to implement. And, forming a consensus between all 28 states having different political parties & their own agendas isn't that easy. States reluctance to

implement it: The taxes would be levied on the basis of Destination Principle (i.e. taxed in state where goods/service is sold/rendered) and State govts are fearful of losing money. Though Central government has put forward a tax revenue sharing program, but States aren't entirely convinced about it. GST is meant to simplify the Indian indirect tax regime by replacing a host of taxes by a single unified tax, thereby subsuming central excise, service tax, VAT, entry tax, etc. However, there is a plethora of challenges before the government for its successful implementation. Some of these are highlighted below:- The GST Constitutional Amendment Bill was passed by the Lok Sabha in May 2015. However, the government faced tremendous political set-backs and failed to get it passed in the Rajya Sabha during the monsoon and the winter sessions last year. - Once this is achieved, another Herculean task would be to get the GST Bill passed by the respective state governments in state assemblies. The government would also be required to put the GST bill in the public domain and give sufficient time to all stakeholders to comprehend and give their views on the bill.

- A large part of the success of GST depends on two prominent factors – 'RNR' and 'threshold limit' for GST. RNR, ie the Revenue Neutral Rate, is the rate at which there will be no revenue loss to the government after implementation of GST. Needless to mention, RNR will impact India Inc adversely, if it is unduly higher than the present tax structure. Based on the study conducted by National Institute of Public Finance and Policy (NIPFP), RNR was decided at 27 percent. However, recently the Economic Advisor Panel recommended an RNR of 15 percent to 15.5 percent, ie a lower tax rate of 12 percent and a standard tax rate of 17 percent to 19 percent. - Further, the threshold limit of turnover for dealers under GST is another bone of contention between the government and the Empowered Committee, aiming to broaden the tax base under GST. - Another factor that will impact the success of GST is the robust IT backbone connecting all state governments, trade and industry, banks and other stakeholders on a real-time basis. The government has already incorporated an SPV viz. – Goods and Services Tax Network (GSTN), which has to develop a GST portal – front-end system for trade and industry and back-end system for all government agencies. GSTN will ensure technology support for registration, return filing, tax payment, IGST settlement, MIS and other dashboards on GST portal to all the stakeholders. - GST is quite different from the existing indirect taxation system in the country. For effective implementation of GST, tax administration staff – both at central and state levels – would require to be trained properly in terms of concept, legislation and procedure. The tax administration staff would also need to change their mindset, approach and attitude towards the tax payers. And for this, they would have to 'learn, unlearn, and relearn' the GST not only in letter but in spirit too. - As per the Constitutional Amendment Bill placed in the Lok Sabha, it was proposed that states would be allowed to levy an additional 1 percent non-vatable tax on inter-state supply of goods for the initial two years, in order to compensate the states for loss of revenue while moving to GST. This was supported by a few states, while a few others criticised the same. However, recently the Empowered Committee recommended abolition of the additional tax. There is no clarity on the same yet. - The taxing events of 'manufacture under central excise', 'sale under VAT' and 'provision of service under service tax' will converge into one taxing event of 'supply' under GST, ie GST will be levied on the event of supply of goods or services. The 'Place of Supply Rules' will thus form an important factor to determine the place of provision of goods or services. • These are some of the major challenges before the government and the industry, ahead of the actual implementation of GST.

**Conclusion** The taxation of goods and services in India has, hitherto, been characterized as a cascading and distortionary tax on production resulting in mis-allocation of resources and lower productivity and economic growth. It also inhibits voluntary compliance. It is well recognized that this problem can be effectively addressed by shifting the tax burden from production and trade to final consumption. A well designed destination-based value added tax on all goods and services is the most elegant method of eliminating distortions and taxing consumption. Under this structure, all different stages of production and distribution can be interpreted as a mere tax pass-through, and the tax essentially 'sticks' on final consumption within the taxing jurisdiction.

•A 'flawless' GST in the context of the federal structure which would optimize efficiency, equity and effectiveness. The 'flawless' GST is designed as a consumption type destination VAT based on invoice-credit method.

•Based on the experience of tax reform and the complexities involved, it is important to underline three important issues. First, given that there are 32 actors in the negotiations (29 states, two Union Territories with

legislatures and the central government), it would take considerable time to finalise the structure and operational aspects of the tax. In view of this, the most optimistic scenario is that it would not be before 2016 that the tax would be implemented, even if the process of amending the Constitution is completed. Second, the tax structure that would emerge from the negotiations would be far from ideal. It would be unrealistic to expect a “flawless” GST. In fact, such a GST structure does not exist in any country where both the centre and states are empowered to levy the tax (Bird and Gendron 2010). Every country has to adopt the structure it can administer. It is neither a gorilla, nor a chimpanzee, but a genus-like primate (Rao 2010). The structure that would emerge would be based on the consensus reached and it is necessary to ensure that the fundamental, sound features of the tax are not compromised. Finally, for the above reason, it is important to consider the GST reform as a process rather than an event. Once the basic features of the tax are implemented, it would be necessary to improve the structure and operational aspects of the tax over time. In fact, the introduction of GST is only the next stage of reform. In that sense, the introduction of GST will not be a silver bullet and we should keep expectations at a realistic level.

## CONTRIBUTION OF FRESH UNION IN FOREIGN EXPORT ESPECIALLY WITH REFERENCE TO INDIA

**Prof. Dr. Deokar Sanjay Bhagawat (M.Com, Ph.D., M.Phil, B.Ed, G.D.C&A)**

*Head, Department Of Commerce, Karmaveer Shankarrao Kale Education Society's,  
Sau. Sushilamai Kale Arts, Commerce & Science College, Gautamnagar, Post- Kolpewadi, Tal- Kopargaon,  
Dist- Ahmednagar (M.S.) 423602*

### **Abstract**

*India is well known as Agricultural economy in the world. Different types of crops are playing a vital role of Indian agricultural. Such crops includes fruit, vegetables, grains etc. contribution of Indian crops is very important in the fulfillment of the need of the country especially for food. Contribution of farmer through agriculture is admirable in the economy. Onion is also one of the important crop of Indian agriculture which is largely cultivated in Uttar Pradesh, Maharashtra, Andhra Pradesh, Tamilnadu, Gujarat etc. states of India. Through this research paper researcher wants to enlighten the lamp on contribution of onion in foreign export.*

**Key words :** *Onion, Export, Indian Agriculture, Cropping pattern etc.*

**I. Introduction :** Cropping pattern of India changes according to weather or environment. There are three types of seasons observed in India like winter, summer and Rain. Onion is the crop which is specially cultivated in the season of winter and rain. India is the second largest onion growing country in the world. Indian onions are famous for their pungency and are available round the year. Indian onions have two crop cycles, first harvesting starts in November to January and the second harvesting from January to May.

### **II. Types or varieties of Onion :**

The major varieties found in India are Agrifound Dark Red, Agrifound Light Red, NHRDF Red, Agrifound White, Agrifound Rose and Agrifound Red, Pusa Ratnar, Pusa Red, Pusa White Round. There are certain varieties in yellow onion which are suitable for export in European countries Tana F1, Arad-H, Suprex, Granex 55, HA 60 and Granex 429.

### **III. States of India where onion is cultivated :**

The contribution of Maharashtra in cultivation of onion is very important. The Major Onion producing states area Karnataka, Bihar, Madhya Pradesh, Andhra Pradesh, Maharashtra, Rajasthan, Gujarat, Haryana and Telangana. Maharashtra ranks first in Onion production with a share of 28.32%.

### **IV. Literature Review :**

**1.** Immanuel raj TK et al reported that productivity of onion has improved from last decade, still onion production is mainly driven by acreage allocation. As onion is irrigated crop and Maharashtra is endowed with relatively less irrigation potential, increasing production through scaling up area may not be feasible without reducing the acreage under other important high value crops. If acreage is not allowed to scale up to meet the growing demand, consumer price will increase, or export has to be restricted or import has to be resorted, which will entail the loss of foreign exchange. Hence, bridging the yield gap or increasing the yield potential would be the solution in the long-run.

**2.** K. C. Gummagolmath revealed from his study the tremendous increase in area and production of onion has been attributed to the rising exports in the recent decade. However, the spurt in export should not lead to price rise. Hence, an appropriate export policy along with policy on fixing Minimum Export Price during glut season should be in place. This will bring a balance in the price discovery of onion.

**3.** B.S. KULKARNI (2012) reported that the concept of developing the onion villages may help increase the export of onion. The provision of financial assistance to exporters to complete in the international market may also be looked into. Export on regular basis not only helps in getting foreign exchange earnings but also allows farmers to get remunerative price for their produce thereby encouraging them to sustain the production and availability of onions. Government should in fact have long term export policy and should even introduce contract production system in suitable pockets.

4. Onion is among the high value agricultural commodities that show tremendous potential for export. Onion is an important vegetable crop grown and consumed widely across the world. India is the second largest producer of onion in the world after China. India is the third largest exporter of fresh onion. Exports of onion from India are permitted by the Government only after meeting the domestic requirements and as a result the onion exports fluctuations are quite often. Initially the exports were permitted to State Trading Enterprises (STEs) and National Agricultural Cooperative Marketing Federation of India Limited (NAFED) and currently STEs issues Non Objection Certificate (NOCs) to associate exporters. However, the government policies have an important bearing on the volume of exports of onion. Due to the strategic significance of onion, the Government often intervenes in the market to regulate the domestic prices.

**V. Research Methodology:** Research is the journey of unknown to known. It is the fact finding process in which different aspects can be studied systematically so that the different areas can be enlighten. For this research paper researcher has used following research methodology: Research is the systematic study of the problem. Through this research work researcher wants to study the contribution of onion in foreign export especially with reference to 2014-2017.

**a. Objectives of the study:**

1. To study the contribution of Onion in foreign export from 2014-17.
2. To study the contribution of Onion in export.
3. To study the problem and prospect of onion export in India.

**b. Type of research Design:**

**Exploratory research Design:**

**i. Exploratory Research Design** is the exploratory research is research conducted for a problem that has not been studied more clearly, establishes priorities, develops operational definitions and improve the final research design. Through this topic, the researcher would like to explore the fact of the onion export especially with reference to India.

**c. Sources of data collection :**

**i. Secondary sources :** The secondary data will be collect by using the following sources like :

- a. Books
- b. Journals
- c. Websites

**d. Sample Design:**

**i. Sample Size:** Researcher would like to collect the data base from 2014-2016 of onion export.

**e. Scope of the study** – The role of onion in Indian agriculture is very important. Onion export is playing a vital role in fluctuation in prices of onion in domestic market. Onion export is one of the important aspects in raising the economic independency of farmers. It gives the guaranteed profitable return to the farmers. Export policy of the onion is one of the valuable decisions of the government. Through this research paper researcher wants to find out the contribution of onion in export of India from 2014-17.

**f. Limitations of the study:**

1. Time limit for the study was limited.
2. This Research study is dependent on secondary data only.

Apart from this researcher has tried his level best to collect the reliable information about this topic.

**VI. Data Analysis and Interpretations:**

India Export of Agro Food Products						
Product Group Report/Country Wise						
Value in Rs. Lacs						
Product: Fresh Onions						
	2014-15		2015-16		2016-17

<b>Total</b>	<b>12,38,102.60</b>	<b>2,30,054.14</b>	<b>13,82,959.54</b>	<b>3,09,720.86</b>	<b>24,15,739.05</b>	<b>3,10,606.44</b>

**Data Analysis and Interpretations:** From the above table it is cleared that quantity as well as value of the onion export is increasing from last three years. In 2014-15 around 12, 38,102.60 MT of onion was exported to various countries which valued of Rs.2, 30,054.14 Lakh. In 2015-16 total 13, 82,959.54 MT onion was exported which was valued of Rs.3, 09,720.86 Lakh. In 2016-17 around 24, 15,739 MT onion was exported which valued of Rs.3,10,606.44 Lakh. Hence the value of onion export is increasing every year.

**VII. Findings and Conclusion of the Study:** From the Above literature review and data analysis it is cleared that role of onion is playing crucial role in foreign export. Every year i.e. from 2014 to 2017 export of onion in quantity and in value is increasing every year. From the study it is also evident that role of intermediaries is also very important in export of onion but their issues regarding commission, brokerage are also affecting on rate of onion so that farmer are suffering rigorously from them. Role of cold storage is also very important because cultivation of onion is seasonal in nature so that it effect on export of onion. Role of middle man should check continually so that irregular supply of onion can be avoided. Fixation of price is major problem as it takes so many factors into consideration. The contribution of onion is increasing each and every year. From the study it is found that In 2016-17 around 24,15,739 MT onion was exported which valued of Rs.3,10,606.44 Lakh. Hence role of onion is very important in foreign export.

## **DEVELOPMENT AND PERFORMANCE OF URBAN COOPERATIVE BANKING IN INDIA**

**Mr. Riyazkhan H. Attar & Dr. G.H Barhate**

*Research Scholar, MANF (Ph.D) C.D Jain College of Commerce, Shirampur (MS)  
Head of Dept. & Research Centre C.D Jain College of Commerce, Shirampur (MS)*

### **INTRODUCTION:**

The primary cooperative banks known as Urban Cooperatives Banks (UCB) have been included in the regulatory scope of the RBI through the extension of some provisions of the Banking Act of 1949 (the BR Act) in force since March 1, 1966 UCB are the basic level of the Indian banking system and offer basic banking services to low-income people, especially the urban poor. The UCB sector is unique in that there is a significant degree of heterogeneity among banks in this sector in terms of size, geographical distribution, performance and financial soundness. The sector has unitary banks, UCB multilateral branches operating within one state and UCBs of different states with the operational area in more than one state. There has been phenomenal growth in the UCB sector since 1966 in terms of the number of banks, branches, corporate size (deposits + loans and advances) and geographic scope. The Reserve Bank has periodically reviewed the performance of the UCB sector and has also set up committees and working groups to analyze regulatory issues related to UCBs, including licensing policy. These committees included the Madhav Das commission (1978), the Marathe commission (1991), the Madhav Rao commission (1999) and the Malegam commission (2010). The working groups (WG) established include the working group to examine issues related to the UCB capital increase under the chairmanship of Shri NS Vishwanathan (2006), WG on Information Technology (IT) Support to UCB under the chairmanship of Shri R Gandhi (2007) and the working group on coordination organizations for UCB under the chairmanship of Shri VS Das (2008).

**OBJECTIVES & METHODOLOGY OF THE STUDY:** Objectives of the study are, to focus development of Urban Cooperative Banking in India. The study is based on the secondary data. As the nature of the study is theoretical, we review the existing available literatures like published books, journals, magazines and research works related to the conceptual, theoretical and foundational framework of Urban Cooperative Banking Sector in India.

**DEVELOPMENT AND PERFORMANCE OF UCB :** In accordance with the recommendations of the Marathe Committee (1992), the Reserve Bank has followed an active licensing policy for UCBs to enable them to exploit the mobilization of deposits and the potential for credit absorption from specific areas. As a result, the period from 1993 to 2004 saw a proliferation of the number of UCBs. Because of its poor financial health, the Reserve Bank devised a vision document in 2005, which envisaged a multi-level regulatory and supervisory strategy to strengthen its profitability. The following mergers / mergers / departures led to a reduction in the number of UCBs. As of 2004-05, the UCB sector underwent 128 mergers until March 2017 and Maharashtra represents the maximum number of mergers, followed by Gujarat and Andhra Pradesh. Despite the sharp decline in the number of UCBs, there has been a massive expansion in its balance sheets which underlines the effectiveness of the consolidation campaign. However, in recent years, the growth of UCB assets has slowed to almost the long-term average. The success of the UCB consolidation unit is also visible in other parameters. The percentage of UCB Tier II, both in number and in assets, has increased rapidly over time. Along with the consolidation, a significant development has been the movement in the mode of distribution of the UCB's total deposits to the larger buckets. This is indicative of the expansion and diversification of its customer base. In 2016-17, the change in the distribution of advances to larger segments was less evident than the change in deposit distribution.

Table 1: Tier-wise Distribution of Urban Cooperative Banks (As on 31/03/2017)

Tier Type	Number of Banks		Deposits		Advances		Assets	
	Number	% Share	Amount	% Share	Amount	% Share	Amount	% Share

Source: Report on Trends and Progress of Banking in India 2016-17 by RBI

The UCB sector also recorded a high degree of concentration of assets. The bimodality of asset class distribution in 2014-15 has become a unimodal model in a broader asset class. The proportion of UCBs with a capital size exceeding Rs.10 billion increased from 4.6 percent in 2014-15 to 6.2 percent in 2016-17. The number of planned UCBs increased from 50 in 2014-15 to 54 in 2016-17, although the increase in the participation of the planned UCB activities (SUCB) was moderated in 2016-17.

**Balance Sheet** UCB's financial statements grew in 2016-17 due to the increase in equity growth (capital plus reserves) and deposits on the liabilities side. An increase in investments and other activities also contributed to the expansion of the budget. UCB loans and advances recorded moderate growth reflecting moderate conditions of demand in the economy, which manifested, among other things, a slowdown in the growth of small retail loans and mortgage lending segments on which the UCBs have concentrated.

Table 3: Liabilities and Assets of Urban Cooperative Banks as on 31/03/2017 (Amount in Rs. Billion)

Particular	Scheduled UCBs		Non-Scheduled UCBs		All UCBs		Growth Rate (%)

Historically, investments have been the preferred use of funds among the UCBs, resulting in low credit / deposit ratios. However, during 2016-17, the incremental credit / deposit ratio of UCB was higher than that of SCB. The UCB investment-deposit ratio fell for the first time below that of the Banks in 2015-2016, as balances with central / state banks were no longer considered as SLR investments as of April 1, 2015. The gap between the investment-deposit ratio of SCB and UCB was reduced in 2016-17. There was a shift in UCB's SLR investment growth, which had declined a year ago and even in 2016-17 there was an accelerated pace of non-SLR investment growth. The increase in investments in SLR, despite the loosening of regulatory requirements, reflects a strong increase in investments in central and state government securities. The UCB reflex fell from 21.5% of net demand and forward liabilities (NDTL) to 21.25% in April 2016 and even more to 21% in July 2016. UCB was required to maintain an SLR of 20.50% effective in October 2016 and 20.50% effective from 7 January 2017.

Table 4: Investment by Urban Cooperative Banks (Amount in Rs. Billion)

Particular	As on March End			Variation (%)	
	2015	2016	2017	2015-16	2016-17
A. SLR Investment	1152	1096	1253	-4.8	14.3

**VIABILITY OF UCBS** The financial soundness of a UCB is determined by the evaluation of CAMELS assigned to it. The CAMELS qualification model (capital adequacy, asset quality, management, earnings and system and control) in its current form has become applicable to UCB since April 2008. The model offers a composite A / B / C rating / D (in descending order of return) to a bank based on the weighted average rating of the individual CAMELS components. The participation of UCB in the lower "D" rating category of CAMELS has steadily decreased since 2013-14. The distribution of UCBS in the rating categories other than "D" did not show any evident change between March 2016 and March 2017.

Table 5: Rating-wise Distribution of UCBS as on 31/03/2017. (Amount in Rs. Billion)

Ratings	Number		Deposits		Advances	
	Banks	% Share	Amount	% Share	Amount	% Share
A	397	25.4	1443	32.5	824	31.6
B	828	53.0	2356	53.1	1411	54.0
C	274	17.6	528	12.0	319	12.1
D	63	4.0	108	2.4	59	2.3
<b>Total</b>	<b>1562</b>	<b>100.0</b>	<b>4435</b>	<b>100.0</b>	<b>2613</b>	<b>100.0</b>

Source: Report on Trends and Progress of Banking in India 2016-17 by RBI

**Capital Adequacy:** Capital is a fundamental criterion for determining the UCB business model in consideration of the permitted activities. It is also an important parameter in the qualification of CAMELS. Against the minimum legal CRAR requirement for UCBS at 9 percent, 82 percent of unplanned UCBS maintained the CRAR above 12 percent in 2016-17.

Table 6: CRAR-wise Distribution of UCBS

CRAR (%)	Scheduled UCBS	Non-Scheduled UCBS	All UCBS
CRAR < 3	4	110	114
3 ≤ CRAR < 6	0	9	9
6 ≤ CRAR < 9	1	8	9
9 ≤ CRAR < 12	4	150	154
12 ≤ CRAR	45	1231	1276
<b>Total</b>	<b>54</b>	<b>1508</b>	<b>1562</b>

Source: Report on Trends and Progress of Banking in India 2016-17 by RBI

Non-scheduled UCBS (NSUCB), which are characterized by a smaller business size, have had higher capital positions than the programmed UCBS (SUCB). In 2016-17, SUCB's financial position showed a significant improvement as reflected in the increase in the percentage of SUCB with CRAR exceeding 9%. While 90% of SUCBs complied with the stipulation of the minimum CRAR, four negative capital adequacy ratios were recorded in 2016-17. Unscheduled capital growth of UCB (capital plus reserves) led to higher business growth in 2016-17.

**Asset Quality:** From 2015-2016, the UCB NPA ratio fell below that of the SCB. The reason for this divergence could be that the large infrastructures and industrial projects traditionally served by the SCB were affected by shortages, unlike the retail sector and small businesses in which UCBS participate. The coverage ratio ratio

(CRP) for UCB decreased during the year. The movement of gross non-performing assets (GNPAa) and PCR over the last few years reflects a delayed response by UCB to the creation of reserves against the increase in impaired assets. This suggests that the increase in the percentage of GNPA in 2016-17 could require more supplies in the future.

Table 7: Non-Performance Assets of UCBs as on 31/03/2017 (Amount in Rs. Billion)

Particular	2016	2017
1. Gross NPAs	150	186
2. Net NPAs	51	68
3. Gross NPA Ratio (%)	6.1	7.1
4. Net NPA Ratio (%)	2.2	2.7
5. Provisioning (1-2)	99	118
6. Provisioning Coverage Ratio (%)	65.9	63.5

Source: Report on Trends and Progress of Banking in India 2016-17 by RBI

A further offer is also envisaged in view of the worsening of the UCB's solvency position, measured in terms of the percentage of unproductive assets covered by total capital plus the reserves in the financial statements of banks.

#### FINANCIAL PERFORMANCE AND PROFITABILITY

UCBs recorded accelerated growth in net income in 2016-17, reflecting growth in both interest income and non-interest income. Although the slowdown in loans and advances caused a certain deceleration of interest, non-financial income increased strongly due to the diversification by the UCBs in a series of remunerated activities to offset the slowdown in lending.

Table 8: Financial Performance of UCBs (Amount in Rs.Billion)

Particular	Scheduled UCBs		Non Scheduled UCBs		All UCBs		Variation (%)	
	2015-16	2016-17	2015-16	2016-17	2015-16	2016-17	2015-16	2016-17

Source: Report on Trends and Progress of Banking in India 2016-17 by RBI

During the period 2016-17, the share of non-financial income from total revenue showed a pronounced increase for UCB, which means a change in traditional brokerage and a diversification of the revenue structure to offset the decrease in interest margins. . A shift to assets that generate non-financial income implies greater capital reserves due to the greater volatility of non-financial income. An analysis of the SUCB shows that the diversification of the UCBs, which is reflected in a higher percentage of non-financial income in total income, has not been completed by the maintenance of greater capital reserves. Both the return on assets (RoA) and the return on equity (ROE) of UCBs are moderate in 2016-17. But within UCB, the indicators of viability of the programmed UCBs have improved compared to the unscheduled UCBs. The programmed UCBs recorded a marginally higher return in 2016-17, but they also showed an improvement in efficiency as their net interest margin (NIM) decreased, indicating a decrease in the cost of financial intermediation. Unplanned UCB profitability indicators remained higher but more variable than those of programmed UCBs.

Table 9: Profitability of UCBs (%)

Indicator	Scheduled UCBs		Non-Schedule UCBs		All UCBs	
	2015-16	2016-17	2015-16	2016-17	2015-16	2016-17
Return on Assets	0.64	0.65	0.95	0.88	0.80	0.77
Return on Equity	8.13	8.29	10.43	9.70	9.42	9.09
Net Interest Margin	2.57	2.43	3.33	3.11	2.97	2.79

Source: Report on Trends and Progress of Banking in India 2016-17 by RBI

At a disaggregated level, the profitability indicators for the scheduled unscheduled UCBs have shown different movements. An analysis by Du Pont of the drivers of the profitability of these two groups of UCB during the different phases of consolidation and reforms points to the differences in the efficient use of assets and the prudent management of costs ....

**PRIORITY SECTOR ADVANCES** Priority loans for the sector must constitute at least 40% of the appropriate net bank credit (ANBC) of the UCBs. Adjusted bank credit (ANBC) is not greater than the total amount of less secured loans and advances with the Reserve Bank and other approved financial institutions plus investments made after 30 April 2007 in non-SLR bonds in the retained category. Held-to-maturity (HTM). Given its urban concentration, unlike the SCBs, the UCBs do not have a mandate for agricultural loans. Credit to micro and small businesses, housing, micro-credit and the "other" components are an important part of their priority sectoral progress. Provision of credits and other financial services and products of no more than 50,000 rupees per borrower or the maximum limit allowed for unsecured advances, whichever is less. The "Other" component includes loans, which do not exceed 50,000 rupees per borrower provided directly by banks to individuals; loans to people in difficulty that do not exceed 50,000 rupees / person per borrower to prepay the debt to non-institutional banks. Loans to self-help groups (self-employment groups) / joint liability groups (JLG) for agricultural and related activities would be considered as priority sectoral progress. Furthermore, other loans to SHG / JLG up to Rs.50000 / - would be considered as micro-credits and would therefore be treated as priorities for the progress of the sector. Loans sanctioned by State-sponsored organizations for SC / ST for the specific purpose of purchasing and providing input and / or marketing products of beneficiaries of such organizations. The loans favored by the sector to the borrowers mentioned above are considered in the "weaker sections"; small and marginal farmers, artisans, villages and small industries where individual credit limits do not exceed Rs.50000 / -; women; SC / ST; People with disabilities; educational loans to people with monthly income not exceeding 5,000 rupees / -; loans to SHG; loans to farmers in difficulty in debts with non-institutional banks; loans to persons in difficulty other than farmers who do not exceed Rs 50,000 / person per borrower to repay the debt to non-institutional providers in advance; and people belonging to minority communities that the Indian government can inform from time to time.

Table 10: Composition of Credit to Priority Sectors by UCBs as on 31/03/2017 (Amount in Rs.Billion)

Particular	Priority Sector Advances	
	Amount	% Share
1. Agriculture Credit	76	3.0
(i) Direct Agricultural Credit	32	1.2
(ii) Indirect Agricultural Credit	44	1.7
2. Micro and Small Enterprises	732	28.0
(i) Direct Credit to SME	576	22.1
(ii) Indirect Credit to SME	156	6.0
3. Micro Credit	108	4.1
4. State sponsored Organizations for SCs/STs	2	0.1
5. Education Loans	22	0.8
6. Housing Loans	253	9.7
7. Total (1 to 6)	1192	45.6
Of which, Advances to Weaker Sections	271	10.4

Source: Report on Trends and Progress of Banking in India 2016-17 by RBI

Historically, the loans granted to the priority sector by UCB were higher than those of the PSBs, but in 2016-17 the UCBs recorded a decrease in the proportion of priority sector advances in total advances. Within the priority sectors, credit to micro and small businesses, micro-credit and agriculture has increased, while loans to other sectors have fallen sharply. Given the mandate of the UCB to advance a part of its priority sectoral corpus in the weakest sections, so that it forms at least 10% of its ANBC, on average, 26% of its priority sector loans have typically been allocated to weaker sections. This percentage decreased in 2016-17. Since April 2016, the "financially" UCBs with a portfolio of loans from the priority sector no less than 90 percent of their gross loans have granted them to grant unsecured advances of up to 35 percent of their total assets (over the maximum limit of 10 percent of total assets according to the audited financial statements at March 31 of the previous year) to give greater impetus to financial inclusion. The condition is that the entire unsecured loan portfolio above 10% is normally allowed to include priority sector loans and exposure to any single borrower does not exceed Rs. 40,000. In summary, ongoing consolidation efforts have been reflected in several UCB performance indicators throughout the year. Increasing deposits and larger investments have led to a sharp increase in the size of UCB's balance sheet. Overall, UCBs showed a better performance in terms of profitability, partly due to diversification strategies facilitated by the improvement of capital positions. But the quality of its activities has undergone a certain deterioration partly due to temporary problems in the repayments suffered by small debtors due to the immediate impact of demonetization.

**CONCLUSION** It is known that UCBs in India are highly concentrated in 5 states. Gujarat, Karnataka, Maharashtra, Tamil Nadu and Andhra Pradesh, which represent 80% of the total UCB and have mobilized equivalent deposits and disbursed proportional loans and advances. These banks use financial assistance for the priority sector and the weaker part of the urban and semi-urban region. There are 1562 UCBs throughout India. In Maharashtra they have 517 and are very concentrated in the district of Kolhapur and Pune. With its unique characteristics, UCB can bridge the gap in commercial banks. The UCB already meets the economic needs of small media in urban and semi-urban areas. The rapid increase in resources and the size of banking reveal its success story. Principle of cooperation, democratic management, educated members, self-sufficiency, deep customer knowledge, service orientation, effective board of directors, efficient employees, easy access to customers, close intimacy with customers, good working systems, convenient banking hours, bank divided structures per hour, good position and bank branches, fast customer services, compactness, limited operating area, local feeling are the unique characteristics and they point more than UCB and add to the strength of these banks. Closed clubs, lack of corporate culture, poor progress, lack of planning, the obstruction of a new plan and lack of professionalism and lack of corporate governance are the weak points of UCB. In the context of globalization, new opportunities are offered to the UCBs. They must adopt strict financial and market discipline,

an environmental analysis of banking marketing and apply modern management concepts and techniques, innovative banks and relational banking services. UCB sweets are the main limits of their work and must be carefully observed and resolved. These include the problem of double control, resistance to change, increasing quotas or non-productive assets, the growth of unprofitable, weak, sick and unlicensed banking units, the liquidation of certain UCBs, etc.

## IMPACT OF GST ON INDIAN ECONOMY

**Dr. Smt. B. D. Patil**

*Associate Professor, H.O.D. , Dept. of Economics, K.T.H.M. College, Nashik-2.*

**Introduction:** Goods and services tax is a consumption tax based on value-added concept. It is a tax to replace tax and service tax. The introduction of Goods and Services Tax (GST) would be a very significant step in the field of indirect tax reforms in India. By amalgamating a large number of Central and State taxes into a single tax, it would mitigate cascading or double taxation in a major way and pave the way for a common national market. From the consumer point of view, the biggest advantage would be in terms of a reduction in the overall tax burden on goods. Introduction of GST would also make Indian products competitive in the domestic and international markets. Studies show that this would have a boosting impact on economic growth. Last but not the least, this tax, because of its transparent and self-policing character, would be easier to administer. The Goods and Service Tax or GST is a taxation system where there is a single tax in the economy for goods and services. This taxation system is meant to create a Single taxation system in the entire country for all goods and services. GST is a tax on goods and services with value addition at each stage having comprehensive and continuous chain of set-of benefits from the producers / service producers point up to the retailer's level where only the final consumer should bear the tax. The Goods and Services tax is a value added tax that will replace all indirect taxes levied on goods and services by the Government, both Central and States, once it is implemented. The GST is all set to consolidate all state economies. This will be one of the biggest taxation reforms that will take place in India once the Bill gets officially the green signal to implement. More than 160 countries' have implemented GST / VAT. GST is a better tax system. It is more transparent, efficient, effective, self-policing and less bureaucratic. This paper presents concept of GST, importance, benefits and its impact on Indian Economy.

**Keywords:** Goods and Services Tax (GST), Gross domestic products, Budget, Development Tax, Multiple Tax, Indian Economy, Tax Reforms, Impact, Indirect Tax, Value Added Tax, Central Value Added Tax.

### **Objectives of the Study:**

The study sets the following objectives:

1. To study the concept and objectives of Goods and Services Tax.
2. To know the importance of Goods and Services Tax.
3. To know the benefits of Goods and Services Tax in India context.
4. To study the impact of Goods and Services Tax on Indian Economy.

**Research Methodology:** The study is completely based on the secondary data. The paper attempts at descriptive analysis based on the secondary data sourced from journals articles and media reports. The secondary data collected from various books, national and international journals, Government reports, publications from various websites which focused on various aspects of Goods and Services Tax.

**Concept and Objectives of Goods and Services Tax:** India is having the most complicated tax structure in the world, especially Indian indirect tax systems. The mechanism of imposing taxes, exemptions, abatements other benefits is different in different states. The existing law has a number of issues of interpretation in various provisions and the category of the products and services. India needs a simple tax structure which can describe the tax mechanism as simple as possible. The basic two drawbacks of existing indirect tax system are cascading effect and non-uniformity of tax collection among states. Introduction of Goods and Service Tax will compensate those drawbacks. The GST is basically an indirect tax that brings most of taxes imposed on most goods and services, on manufacturer, sale and consumption of goods and services, under a single domain at the natural level. In the present system, taxes are levied separately on goods and services. The GST is a consolidate tax based on a uniform rate of tax fixed for both goods and services and it is payable at the final point of consumption. At each stage of sale or purchase in the supply chain, this tax is collected on value-added goods and services through a tax credit mechanism. Following are the mainstay of GST:

- Removing Cascading Effect: GST removes “Tax on Tax Effect” and provides common national market for Goods and Services.

- Single Umbrella Tax Rate: GST will harmonize indirect taxes being levied by Union and State Governments.

The reference of GST was first made in the Indian Budget in 2006-07 by the then Finance Minister Mr. P. Chidambaram as a single centralized Indirect tax. The Bill was introduced on December 19, 2014 and passed on May 6, 2015 in the Lok Sabha and Passed in Rajya Sabha on 3rd August 2016. The Government wants to implement GST Bill From 1st April 2017. Clause 366(12A) of the Constitution Bill defines GST as “goods and services tax” means any tax on supply of goods, or services or both except taxes on the supply of the alcoholic liquor for human consumption. So GST is a comprehensive tax levy on manufacture, sale and consumption of goods and services at a national level. GST will replace all indirect taxes levied on goods and services by the Indian central and State Governments.

#### Scope of Goods and Services Tax:

- GST is applicable on the supply of goods and services.
- Alcoholic liquor for human consumption is exempt from GST.
- Initially GST will not apply to: Petroleum crude, high speed diesel, motor spirit (Petrol), natural gas, and aviation turbine fuel.
- The GST council will decide when GST will be levied on them.
- Tobacco and tobacco products will be subject to GST.
- The centre may also impose excise duty on tobacco.

#### Objectives of Goods and Services Tax:

GST is to fulfill the following objectives:

- GST would help to eliminate the cascading effects of production and distribution cost of goods and services. This would help to increase GDP and then to economic condition of the country.
- GST would eliminate the multiplicity of indirect taxation and streamline all the indirect taxes which would be beneficial for manufacture and ultimate consumer.
- GST would be able to cover all the shortcomings of existing VAT system and hopefully serve the economy health.
- Incidence of tax falls on domestic consumption.
- The efficiency and equity of system is optimized.
- There should be no export of taxes across taxing jurisdiction.
- The Indian market should be integrated into single common market.
- It enhances the cause of co-operative federalism.

**Revenue Consideration under Goods and Services Tax:** The tax system will subsume both central and state indirect taxes and levies. On the combined tax based dual GST (CGST, SGST, and IGST) will be levied. The details of state and central taxes those will be subsumed under GST are presented below. GST would replace most indirect taxes currently in replace such as:

Central Taxes	State Taxes
<ul style="list-style-type: none"> <li>• Central Excise Duty {Including additional excise duties, excise duty under the Medicinal and Toilet preparations(Excise Duties) Act, 1955}</li> <li>• Service Tax</li> <li>• Additional Customs Duty (CVD)</li> <li>• Special Additional Duty of Customs (SAD)</li> <li>• Central Sales Tax (levied by the Central and collected by the States)</li> <li>• Central surcharges and cesses (relating to supply of goods and services)</li> </ul>	<ul style="list-style-type: none"> <li>• Value Added Tax</li> <li>• Octroi and Entry Tax</li> <li>• Purchase Tax</li> <li>• Luxury Tax</li> <li>• Taxes on lottery, betting &amp; gambling</li> <li>• State cesses and surcharges</li> <li>• Entertainment Tax (other than the tax levied by the local bodies)</li> <li>• Central Sales Tax (Levied by the centre and collected by the states)</li> </ul>

**Importance of Goods and Services:**

- GST will widen the tax base improve tax compliance remove existing unhealthy competition among state and re-distribute the burden of taxation equitably among manufacturing and services.
- GST will ensure the uniformity of taxes across the states regardless of place of manufactures or distribution.
- GST would integrate the tax base and allow seamless flow of input tax credit across the value chain of goods and services which will lead to reduced cost of goods and services.
- GST environment would lead to improved disclosure of economic transactions which may have a positive impact on direct tax collections also.
- The average tax burden on companies will fall which will reduce the costs of Indian goods and services in the international market and give boost to Indian exports.
- It will mitigate cascading and double taxation and enable better compliance through the lowering of overall tax burden on goods and services.
- Overall it will result in increasing revenue at the centre as the tax collection system becomes more transparent, making tax evasion difficult.

**Benefits of Goods and Services Tax:** Benefits of GST shall accrue to all- trade and industry, Government and consumers. Trade and industry shall benefit in terms of easy compliance, removal of cascading effect of taxes and enhanced competitiveness. The Government shall have better control on leakages, higher revenue efficiency, consolidation of tax base and it may be easier to administer and monitor the law. Consumers will also benefit from likely reduced prices and single transparent tax structure. The uniformity in tax rates and procedures across the country will lead to various benefits for the economy and the consumers.

**Make in India**

- Will help to create a unified common national market for India, giving a boost to Foreign investment and “Make in India” campaign;
- Will prevent cascading of taxes as Input Tax Credit will be available across goods and services at every stage of supply;
- Harmonization of laws, procedures and rates of tax;
- It will boost export and manufacturing activity, generate more employment and thus increase GDP with gainful employment leading to substantive economic growth;
- Ultimately it will help in poverty eradication by generating more employment and more financial resources;
- More efficient neutralization of taxes especially for exports thereby making our products more competitive in the international market and give boost to Indian Exports;
- Improve the overall investment climate in the country which will naturally benefit the development in the states;
- Uniform SGST and IGST rates will reduce the incentive for evasion by eliminating rate arbitrage between neighboring States and that between intra and inter-state sales;
- Average tax burden on companies is likely to come down which is expected to reduce prices and lower prices mean more consumption, which in turn means more production thereby helping in the growth of the industries . This will create India as a” Manufacturing hub”.

**Ease of Doing Business**

- Simpler tax regime with fewer exemptions;
- Reductions in the multiplicity of taxes that are at present governing our indirect tax system leading to simplification and uniformity;
- Reduction in compliance costs - No multiple record keeping for a variety of taxes - so lesser investment of resources and manpower in maintaining records;
- Simplified and automated procedures for various processes such as registration, returns, refunds, tax payments, etc;

- All interaction to be through the common GSTN portal- so less public interface between the taxpayer and the tax administration.
- Will improve environment of compliance as all returns to be filed online, input credits to be verified online, encouraging more paper trail of transactions;
- Common procedures for registration of taxpayers, refund of taxes, uniform formats of tax return, common tax base, common system of classification of goods and services will lend greater certainty to taxation system;
- Timelines to be provided for important activities like obtaining registration, refunds, etc;
- Electronic matching of input tax credits all-across India thus making the process more transparent and accountable.

**Benefit to Consumers:**

- Final price of goods is expected to be lower due to seamless flow of input tax credit between the manufacturer, retailer and service supplier;
- It is expected that a relatively large segment of small retailers will be either exempted from tax or will suffer very low tax rates under a compounding scheme- purchases from such entities will cost less for the consumers;
- Average tax burden on companies is likely to come down which is expected to reduce prices and lower prices mean more consumption.

**Impact of Goods and Service Tax on Indian Economy** Amidst economic crisis across the globe India has posed on a beacon of hope with desirable growth targets, various schemes or missions like Make in India, Digital India etc. The Goods and Service Tax (GST) bill is expected to provide the much needed pace for growth of economy in India by transforming the existing complicated taxation system into single point taxation system in the country. Uniformity of tax will lead to single point taxation for supply of goods or services across country. GST would improve the country's tax to GDP ratio and also prevent inflation. It is expected that the GDP growth is likely to be raised up to 1 to 2%, but the results can only be analyzed after the implementation of GST. By merging large no. of centre and state taxes into one single point taxation system will reduce burden on producers and foster growth through more production. Various toll plazas and tax barriers leads to a lot of wastage for perishable items being transported which leads into the increase the costs of goods. GST could eliminate this road block which leads to lowering of prices for essential goods. GST would prove to be beneficial for the manufacturing sector where the tax rate is very high. Implementation of a single National GST will have major beneficial impact on all stake holders. The key highlight of such impact is given below:

1. GST is a better tax system. It is more transparent, efficient, effective, self policing and less bureaucratic. GST would eliminate double taxation under the current SST. Consumer will pay fair prices for most goods and services compared to SST.
2. For businesses, they are able to reduce their cost of doing business since they are able to claim GST incurred on their business inputs. For example, under the current taxation system, manufacturers are not allowed to claim service tax on telecommunication, accounting and legal services and sales tax on indirect inputs such as office equipment and furniture. These taxes are embedded into the price of the goods sold. Hence, the cost of doing business increases. Under the GST system, any GST incurred on acquisition is claimable and is not a cost to businesses.
3. As such, Malaysian exports will become more competitive in the global market as no GST is imposed on exported goods and services. This will strengthen our export sector which would contribute to the economic growth of the country. 112 Introducing GST and Its Impact on Indian Economy
4. To make our exports more competitive, GST on exports will be zero-rated and the exporter can recover all the input tax incurred in the course of his business.
5. At present, imported goods are subject to import duty and sales tax unless exempted. Under GST, imported goods will still be subject to import duty but sales tax will be replaced with GST. As to whether the imported goods will be cheaper or more expensive will depend on a number of factors besides the GST rate.
6. There will be a positive impact on the economy due to the following:
  - Lead to more competitive pricing
  - Reduction in business costs:

- Special schemes to alleviate cash flow problems
- Credit offset mechanism
- Can claim the input tax due based on the invoice produced
- Speeds up economic union of India
- Better compliance and revenue buoyancy replacing the cascading effect (tax on tax) created by existing indirect taxes, tax incidence for consumers may fall lower transaction cost for final consumers
- Reduce shadow economy activities
- Makes our export more competitive as exports are to be zero-rated
- Increase in Gross Domestic Product
- By merging all levies on goods and services into one, GST acquires a very simple and transparent character
- Uniformity in tax regime with only one or two tax rates across the supply chain as against multiple tax structure as of present
- It is a tool to manage the economy e.g. tourist refund scheme is proposed as a means to boost the tourism industry and tourism spending in the country, exports are zero-rated to make our goods more competitive globally.
- Increased tax collections due to wide coverage of goods and service
- Improvement in cost competitiveness of goods and services in the international market.

**Conclusion:** History has proved that many countries have benefited from moving to a GST regime. In India, implementation of GST would also greatly help in removing economic distortions caused by present complex tax structure and will help in development of common national market. The implementation of GST in the Indian framework will lead to commercial benefits which were untouched by the VAT system and would essentially lead to economic development. The real success of the GST lies on the impact on the common Indian consumer. The essence of GST is that all goods and services be taxed at moderate rate. "One Nation, one Tax", proves to be a game changer in a positive way. And no doubt, GST will simplify existing indirect tax system which will help to remove inefficiencies created by the existing current heterogeneous taxation system only if there is a clear consensus over issues of threshold limit, revenue rate and inclusion of petroleum products, electricity, liquor etc. We hope GST leaves a positive impact and helps to boost up Indian economy and a rising Indian economy will help in the financial growth of the common man. The successful implementation of GST depends on the understanding and co-operation between Central and state Governments. Taxation system is very important for the economy because they maintain equity of income group. Consumption and productions of goods and services undeniably rising and because of multiplicity of taxes in current tax system organization complexities and conformity cost is also increasing. Accordingly, a simplify user friendly and transparent tax system is required. GST will solve the problem of complexity of tax system because it will replace the current tax system of India. A single tax system will remove all other complex taxes of centre and state Government like VAT, Cenvat, Luxury tax, Octroi, Entry tax etc. By the implementation of GST cost of manufacturing of goods will reduce. The cost of consumer goods will reduce. GST will provide relief to producers and consumers by providing wide and comprehensive coverage of input tax credit set off. Service tax set off and subsuming the several taxes. GST is likely to improve tax collection and boost India's economic development. It is preferred very economy that must adopt GST at national level to make their economy attractive for foreign investors. By implementing GST, the developing economies like India can achieve sustainable and balanced development.

## GLOBALIZATION'S IMPACT ON ORGANIZATION'S CULTURE

Dr.Manisha A.Navare

B.Y.K.College of Commerce, Nashik-05

**Introduction-** Today's world is LPG world. In the past two decades, there has been changing in organizational culture due to Globalization. Due to the complex technology, there has been change everywhere in various factors such as business environment, infrastructure, HR policies and practices, career planning and development and organization culture etc. HR has moved from file management to sound employee relations and their retentions. While earlier to communicate to the employees was through using only oral and written communications. But nowadays, it is becomes very easy to communicate to the employees through using chats, whatsapps and email-based conversations. The cultural innovation today is focused on measures and initiatives for increasing the engagement quotient of employees. Organization should accept the challenges before globalization for developing sound organizational culture.

**Meaning and Definition of Globalization-** Globalization means different people come together for doing different things. It is the process of exchange of goods and services across the international border. Multinational corporations (MNC), spread their functions over a number of countries due to globalization.

**Definition-** According to Deepak Nayyar- "It (globalization) can be across political boundaries of nation states. More importantly, perhaps, it refers to a process of deepening economic integration, increasing economic openness and growing economic interdependence between countries in the world economy. It is associated not only with a phenomenal spread and volume of cross-border economic transactions, but also with an organization of economic activities which straddles national boundaries." From an economic point of view, globalization happens through three channels-i)trade in goods and services, ii)movement of capital, and iii)flow of fiancé.<sup>1</sup>

**International Monetary Fund defines Globalization** as "the growing economic interdependence of countries worldwide through increasing volume and variety of cross border transactions in goods and services and of international capital flows and also trough the more rapid and widespread diffusion of technology."

**Charles U.L.Hill defines globalization** as " the shift towards a more integrated and interdependent world economy. Globalization has two main components- the globalization of markets and the globalization of production."<sup>2</sup>

### Main Components of Globalization-

Main components of Globalization are as follows-

### Reasons for Globalization of Markets-(Rao-66)

There are various reasons for Globalization of markets which includes-

**Mass Production-** Large scale industries make mass production. As per compare the domestic market, it is very small size in production.

**Expansion of Market-** Globalization expands the market through providing capital flows, latest technology, talented human resource, cheaper source of imports and larger export markets.

**Accomplish Goals-** Companies globalize markets in order to increase their profits and achieve company goals.

**Expansion of Demand-** Globalization provides the opportunity to the companies for their products in the foreign markets.**Customer satisfaction-** Customer is the king of the market. In the globalization world, customer satisfies through buying good quality, quantity of products with quick delivery of service. This provides the satisfaction to customers.<sup>4</sup>

**Meaning and Definition of Culture**

**Culture-** Culture is something which is created and resides in the minds of the people. Culture includes laws, knowledge, belief, art, morals, customs and other capabilities and habits acquired by man in a society. Two terms are key to the concept culture: history and shared phenomenon.<sup>5</sup>

**Organization Culture-** Definition- 1. According to Edgar Schein “ A pattern of basic assumptions invented, discovered, or developed by a given group as it learns to cope with its problems of external adoption and internal integration that has worked well enough to be considered valuable and, therefore, to be taught to new members as the correct way to perceive, think, and feel, in relation to those problems.”

2. Turnstall” A general constellation of beliefs, morals, value systems, behavioral norms, and way of doing business that are unique to each corporation.”<sup>6</sup>

**Characteristics of Organizational Culture-** Following are the characteristics of organizational culture- Observed Behavioral Regularities- In any organization, while the employees are working or communicating, they generally use common language, terminology, and other rituals that relate to deference and demeanor.

1. Common Norms- There are some common norms which determines the standards of behavior to guide the organizational members how much work to do.

2. Dominant Values- Each organization determines some dominant values to their employee’s i.e. high product quality, sincerity, performance, customer satisfaction etc.

3. Policy and Philosophy- Organization formulates policy which gives the guidelines to employees in detail. It provides the information about responsibility of organization towards the employees and also the responsibility of organization towards the employees. Philosophy prescribes how employees and customers are to be treated.

4. Organizational Climate- It means the overall “feeling” that is conveyed by the physical layout, the way organizational participants interact with one another and also the interaction of employees with the outside parties.<sup>7</sup>

5. Risk Tolerance- The degree to which employees are encouraged to be aggressive, innovative, and risk-seeking.

6. Direction- The degree to which the organization creates clear objectives and performance expectations.

7. Reward System- This is depending upon the performance evaluation of employees.

8. Management Support- It consists proper communication, assistance and support to their subordinates.

9. Communication Patterns- The degree to which organizational communications are restricted to the formal hierarchy of authority.

10. Identity- The degree to which members’ identity with the organization as a whole rather than with their particular workgroup or field of professional expertise.

11. Conflict Tolerance- It consists that employees are encouraged to air conflicts and criticisms openly.<sup>8</sup>

**Impact of Globalization on Organizational Culture-**

Impact of Globalization on organizational culture is as follows-

1. *Higher standard of living-* Globalization reduces prices and thereby enhances consumption and standard of living of employee not only in the organization but also in the society. Due to globalization especially multinational organizations provide benefits in various forms to all levels of employees.

2. *Higher knowledge-* Due to globalization organization recruits talented human resource. So that organization adopts higher knowledge of the resources in the other countries.

3. *Cultural Exchange* – Globalization reduces the physical distance among the countries and enables employees of different countries to acquire the culture of other countries. They may share their views, thoughts, ideas and opinions with the employees of the other countries.

4. *Employment opportunities-* Globalization provides good job opportunities to employees across the national border.

5. *Increased cultural diversity-* Globalization creates a large shift in organizational behavior as increasing diversity which brings together people of different backgrounds with different values, cultures and beliefs all working together for common objective.

6. *Lack of Trust-* In any organization trust is the main element of the organizational culture. MNC’s faces complex, dynamic and high risk environment. Employees often work together without ever meeting face-to-face

and without sharing the same meaning system, cultivating trust is even more important and sometimes it becomes critical to develop. Sometimes it may become the obstacles in the global work culture.

7. *Changes in the Income-* Due to globalization many companies' changes their traditional HR policies. They added various issues and facilities, benefits to workers. It changes their income in the organization which motivates them to do their job effectively and efficiently.

8. *Adopts various methods of training-* Employee training is necessary not only to faces the various challenges related to culture of the other countries which increases the skills and abilities of the employees. Also it is necessary to adopt cultural, religious and ethnic diversity in the workplace. Organization uses various methods of the training and it evaluates through using performance appraisal methods.

**Conclusion-** Globalization put the different people in the countries come together. It increases economic openness and grows economic interdependence between countries in the world economy. It changes the organizational culture through increasing standard of living, their knowledge, employment opportunities, income etc. Thus it impacts on the organizations especially multinational organizations.

## **EMERGING TRENDS IN MARKETING**

**Prof. Sushil D. Pawar**

*Assistant Professor, C. D. Jain college of commerce, Srirampur*

**Introduction:** New market structures arising from digitalization, deregulation, globalization, and open-standards that are shifting the balance of economic power from the sellers to the buyers. In such markets information is freely and widely available, and is almost instantly accessible. To compete in these scenarios, a firm must adopt new processes based information technologies, and must keep a close watch on the price, quality, and convenience trends. Small business owners should remain aware of the current business trends in the market, in order to stay ahead of the curve and be ready to address rapidly changing demand. If your business fails to monitor current small business trends, then your company will be tied to archaic methods while rivals prosper from more modern and efficient methods of conducting business. Here are several of the top business trends for small business owners to monitor.

1. Master Micro-Moments Mobile gadgets have proved to be a major influence in customer interaction and engagement with brands across the globe. But the surprising thing for most people is the concept of “micro-moments”, which has powered the shift to mobile phones. From long-term goals such as planning to purchase a home, or something as small as acquiring a quick grocery from the nearest store or even locating the ingredients of a dish from your phone, etc., numberless of these micro-moments stimulate the impulse to reach out for our mobile phone. As per *think with Google*, micro-moments are highly critical and evaluative touch points where customers expect brands to cater their needs with reliable information, regardless of the time and location. Whenever a customer feels the need to inquire about something, an astounding 96% of users reach for their smartphones to conduct the required research at that very instant. Only successful brands have the tendency to correctly anticipate and address the exact micro-moment needs by providing the right information at the right time to customer in need. A useful, quick and one-touch access to the needed information becomes the basis of acquiring customer trust and building long-lasting relationships.

2. Visualization More Important Than Ever For all the exciting and informative things found online, whether it is a couple of kittens playing, a baby laughing, or a top commercial featuring a popular model, there is always an element of video. With a video, people tend to accept and attach on a much deeper level due to the usage of visually-rich and interactive elements depicting a proper message or story. And as a consequence, audience is tempted to take considerable action in terms of likes, sharing, etc. With time, brands have been able to capitalize on the introduction of highly-engaging video features on different social media platforms like Facebook, Twitter, Snapchat and Instagram. For this trend, we are going to focus on video aspect only since businesses are seizing the opportunity to differentiate their brand in the competitive industry. Mobile users are tending to spend more time than ever with their smartphones, with the excitement to watch videos online being proportionate as well. Consumers are more tempted from videos because of the deeper attachment they experience from the visual on-screen elements.

3. The Best Visibility with Native Ads

To grab a plain sight exposure in front of the right audience, native advertising has become one of the most sought-after marketing methods. Most users find interruptive ads frustrating and irrelevant. For instance, browsing a website and instantly an out-of-context ad pops out of nowhere is a big no-no for the user. This is a common concern, which is best catered by native ads. It facilitates brands to market their offerings in a quite non-disruptive way that blends in easily with the environment a user is most comfortable. Native ads blend in such a seamless manner, that customers may not even spot them when viewing let it be advertorial, instant content, search advertising, recommended content or sponsored listings form of native advertising. Rather than approving it as a deceiving aspect, the point is to put the right information in front of the viewer when they actually need it.

4. Personalization

This year, one thing is for certain that content marketing is going to be the core focus when devising a marketing plan while running hand-in-hand with a very important goal: a personalized experience for each customer. But the glaring question remains in place: *How can you know that each customer's specific needs are perfectly catered?* The key is to drift away from traditional static content to a more dynamically-rich content. The best practice is to create a dynamic website and a smart marketing automation plan that delivers top content. This creates a unique experience for the customer that matches their specific needs and preferences. Consider the following scenario: A new visitor just navigates on your website. The message you want to communicate them would be different than the message running for an existing customer. For this new visitor, a standard message containing a ready-made snapshot of your offers and a chunk of engaging content will go well. As for the current customers, an individualized message pertaining their specific needs can be thrown to retain and pull them back in order to acquire a new product that entered your listings just recently.

#### 5. Raise a Team of Influencers

If you get a customer to love your brand, he/she can become the basis through which a positive word-of-mouth and brand awareness can be spread. *But how do we transform a customer into a strong influencer?* Although there are various ways to achieve this, but the basic roadmap remains the same—acknowledging and providing the needs your customers are literally looking for. If you offer solutions that truly understand and solve their problem, then it becomes easy to make them more brand loyal. In order to genuinely acquire a team of influencers that could become an additional weapon in your arsenal of brand promotion and recognition, marketers first need to understand the benefits a group of influencers can provide. *Function like a Snowball Effect!* As stated above, if a customer is pleased with the performance of your brand, it's nearly possible he/she will promote it in their circle and environment, whether at a workplace, a social gathering, an old friends gathering, on a social media platform, or even at a casino night. The point is to express your positive opinion and experiences regarding a brand to others you care about. The message triggers a chain reaction, the satisfied customer will tell his/her friends, family and other people in the circle, the group will be impressed to try the brand themselves and spread the word further, and so the cycle continues and thrives. This indicates a snowball effect—what started with a minor state of significance, gradually rolled over to become a powerful influence in the form of pleased customers acting as dedicated promoters of your brand. *Acquire maximum impact from your defined budget!* Converting customers into mighty influencers is one of the most low budgets but indispensable way to encourage your brand recognition. But what if you want to grab more control over the whole process? You can take control to the next level by hiring some elite brand ambassadors or popular profiles such as celebrities, artists, or a much modern and hot trend nowadays—well-known bloggers or YouTube sensations. Agreeably the return on investment and spread of brand awareness at the hands of such elite industry influencers is undoubtedly positive. But let's not forget that not every firm in the industry is financially sound enough to afford such initiatives. You may have a product equipped with state-of-the-art features and offering a plethora of benefits to its target market, but when there is a well-known person promoting the product to the audience him-/herself, this calls for an extra boost in public interaction and response. The best thing about influencers is they can be hired on the basis of your budget, regardless of its scale. It all works on person-to-person interaction. When a high-profile celebrity is out there interacting with audience to promote your brand, there is an extremely high probability for spreading of brand awareness, without stopping anytime soon.

#### 6. Investment in Content Developers

It's all about creating a content that is easily memorable, unique and personalized in nature. So how do we do it? Hire an experienced writer who is not only able to write unique and creative content, but his knowledge base should be potent enough to fluently write on a variety of topics in order to attract a large audience from different industries. The game plan is to develop and promote a content that retains existing customers who will keep coming back for more as well as attract others through an encouraging word-of-mouth. An acquainted writer knows best how to play with words perfectly and creatively. The professional will create a story/case study relating to your brand well that allows customers to feel attachment with the brand on much deeper and personal level. The practice of building editorial groups consisting of journalists, production leads, etc. is on the rise to position them as thought-leaders. The objective of the editorial and content development team is to produce attractive content that facilitates a healthy conversation. They also urge the audience to trust you on providing them updated and authentic information on different industry subjects. *The impact of in-house content*

*development!* A potential way to work with a team of content creators is by partnering with a video channel giant—such as YouTube. As per Think with Google, Toyota is working on a multitude of campaigns with YouTube content developers with the goal of sending personalized content to their customers. The leading automobile company has asked content experts to produce content this is customer-oriented while incorporating their brand intelligently. The move earned the firm a brand engagement of 180 million and above impressions, a YouTube content series, along with increased revenues.

#### 7. Convert with the Right Data

If you have the right data, then a professional digital marketer can understand the exact customer behavior and what it takes to deliver the best efforts. Especially this year when the trend of providing real-time responses to consumers is growing increasingly crucial, associating the data with the right tools will be very vital. *Why is there a need for Big Data?* Big data is one of the most commonly heard terms in data management that comes with a number of questions. Due to the massive amount of data involved and its heavy emphasis on different digital marketing cultures like segment marketing, personalized marketing, native marketing, etc., its implementation into marketing strategies is quite complex and impossible to cover in brief. Equipped with the right marketing arsenal, any digital marketing agency can utilize big data. Take the case of EGC Group for example, a top digital marketing agency excelled in big data science and management. EGC's data states that even though a number of companies are using Google Analytics, they aren't incorporating the data with marketing automation and CRM tools (Marketo, HubSpot, Salesforce, etc.). Here are some figures that help us understand the impact and increasing importance of big data trend that is likely to go strong in the coming years.

1. Highly data-oriented enterprises are 3 times more likely to improve their decision-making processes
2. Every 9 out of 10 owners feel their businesses have missed opportunities because sales agents were not able to make the most out of the information available in front of them
3. IDC forecasts for big data industry to reach around a worth of \$102 billion by 2019

Conclusion - With digital technology on the rise to sophistication and global acceptance, the scope for different businesses and brands to engage and interact with their target market is boundless now — 2017 being the most active year up till now. Therefore, it is 'now' when companies should start incorporating these trends in their strategic planning process for 2018. You may be a nice 6 months ahead of the actual execution phase, but getting well-prepared beforehand will give you a competitive edge. All these major emerging marketing trends are monitor the business owner's.

## **AGRICULTURAL MARKETING IN INDIA: PROBLEMS AND PRESENT STATUS**

**MS. Nayan Deepak Kale**

*Assistant Professor, Department of Commerce, MVPS's K.S.K.W Arts, Science & Commerce College, Uttamnagar, CIDCO, Nashik- 422008*

### **Introduction**

The term agricultural marketing include all those activities which are mostly related to the procurement, grading, storing, transporting and selling of the agricultural produce. Agricultural marketing covers the services involved in moving an agricultural product from the farm to consumer. Numerous interconnected activities are involved in doing this, such as planning production, growing and harvesting , grading, packing, transport, storage, agro and food processing, distribution, advertising and sale. Agricultural marketing definitions would even include, “the acts of buying supplies, renting equipment and paying labor”, arguing that marketing is everything a business does. Such activities cannot take place without the exchange of information and are often heavily dependent on the availability of suitable finance. Marketing systems are dynamic; they are competitive and involve continuous change and improvement. Agricultural marketing has to be customer oriented and has to provide the farmer, transporter, trader, processor etc. with a profit.

### **Objectives of the study:**

. The main objectives of the present paper are as follows:

- To know the concept of Agricultural marketing.
- To Study the Problems and Present Status of Agricultural marketing in India.

**Meaning of Agricultural Marketing:**The National Commission on Agriculture defined, Agricultural marketing as a process which starts with a decision to produce a saleable farm commodity and it involves all aspects of market structure of system, both functional and institutional, based on technical and economic considerations and includes pre and post harvest operations, assembling, grading, storage, transportation and distribution. The Indian council of Agricultural Research defined involvement of three important functions, namely (a) assembling, (b) preparation for consumption (processing) and (c) distribution. Agricultural marketing means the commercial functions involved in transferring agricultural products consisting of farm, horticultural and other allied products from producer to consumer. Agricultural marketing also reflect another dimension from supply of produce from rural to rural and rural to urban and from rural to industrial consumers.

**Problems in Agricultural Marketing:** The difficulties encountered by the producers of agricultural goods in marketing have been explained below.

**1. Low marketable surplus of Agricultural goods:** The number of small and marginal farmers is more in India. These farmers hardly produce for the market. The market, therefore, depends more on big farmers. The output of these few big farmers will have to reach different markets. The net result is that the quantity of agricultural goods available will be inadequate in relation to the demand.

**2. Producer does not determine the price:** In the case of consumer and industrial goods, it is only the producer who determines the basic price of the product. He is also sure of his margin. In contrast to this, the producer of agricultural goods does not know the price at which his produce would be sold to the ultimate consumer. It is not something decided by the farmer. It is only the intermediaries who determine the final price in marketing agricultural goods. The grower, in fact, is not sure of his revenue also.

**3. Lack of storage:** Agricultural goods are easily perishable. Their production is also seasonal. But they are demanded throughout the year. This means that agricultural goods need to be stored in warehouses so that they can be made available at the right time in the market. The farmers, who are the producers of agricultural goods, may not have their own storage facilities. This is in contrast to the situation in consumer and industrial goods marketing where the producers have their own warehouses. Absence of storage forces the farmers to sell their produce at the earliest. Sometimes, they sell at a very low price in the market. Thus, the farmers, as the producers, get a very low or even no profit.

**4. Problems in Transportation:** Most of the villages in India do not have proper roads. The farmers, as a result, have to rely mainly on bullock carts and such other conventional mode to transport their agricultural goods. This leads to delay in the produce reaching the market. Although trucks are increasingly used in transporting perishables, the cost of transportation is generally very high. As a result, the farmers get a very low return on their output.

**5. Long chain of middlemen:** Agricultural goods, perhaps, have the longest chain of middlemen. There are a number of intermediaries in the market like the wholesalers, brokers, commission agents, retailers and so on. The agricultural goods pass through all these people before they reach the ultimate consumer. As it passes through each individual, the price increases. So, it is only the consumer who is finally made to bear the burden. Thus, the high price paid by the consumer does not reach the grower. It is pocketed only by the market intermediaries.

**6. Malpractices in the market:** In the market, the intermediaries indulge in a number of undesirable practices to make quick money at the cost of the producer and the consumer. The following are some such activities:

(a) Use of false weights and measurements, (b) Adulteration Black-marketing and hoarding and so on. Such malpractices are considered a major problem in marketing agricultural goods.

**7. Lack of Market Information:** The availability of internet now has given every industrialist an easy access to any information. The poor and illiterate farmers have no access to such methods of gathering information about the market for their agricultural goods.

**8. Inelastic demand:** The demand for agricultural goods is not influenced by a fall or rise in their price. As a result, the producer will suffer on account of fall in the price during bumper harvest.

**9. Lack of Grading:** Standardization enables the producer of consumer or industrial goods to get the right price for his products. Standardization has no relevance for agricultural goods. But they can be graded according to their size, shape and so on. But in the market, little importance is given for grading the produce and as a result the producer gets the same price for different varieties of goods.

**10. Bulky nature:**

The bulky nature of agricultural goods necessitates packing. Otherwise, they cannot be taken to various market centers. This job has to be done manually and it involves labor. Gunny bags, bamboo baskets etc., are the materials used for packing.

**Present Status of Agricultural marketing in India** Indian agricultural has set new mile stones in its progress. Tremendous strides have been made in recent past. All time high record of production of 209 million tonnes of food grains in 1999-2000 and 137 million tonnes of fruits and vegetables etc reminds us of reviewing the past and the strategies to be conceptualized keeping in view the future and fast changing scenario. The increased trend in production has brought in its wake new challenges to handle in terms of huge marketable surplus. A strong and efficient marketing systems is the core content of agricultural Marketing in the country keeping in view three management of Marketable surplus. It is also noteworthy to find the markets overseas keeping in view the policy of liberalization. Government organized marketing of agriculture in the country through the network of regulated markets established under the provisions of the Agricultural Produce Market Act enacted by the states and union territories. As on 31/3/2001 the markets covered under regulation is 7177. In addition there are 27924 rural periodical markets or hats. About 15% of these in markets have been brought under the ambit of the regulation.

- The regulated markets have helped in mitigating the market handicaps of producer's sellers. These have also provided physical facilities and institutional environment to the wholesalers commission agents. Traders and other functionaries for conducting activities.

- It was envisaged that these regulated markets will provide facilities and services which would attract the farmers and buyers creating competitive trade environment thereby offering best of prices to the producer-sellers.

- Studies of regulated markets show that they have achieved limited success in providing need based facilities and services conducive to achieving greater marketing efficiency. Most of these markets lack requisite facilities for handling the produce arriving in the yard. Rural markets in general and tribal hats in particular remained out of the ambit of the development.

- Over a period of time these markets have acquired the status of institution with control and restrictions providing no help in direct marketing organized marketing organized retailing smooth supply of raw material to

agro-processing units competitive trading information exchange adoption of innovative marketing system and technologies etc. as was envisaged under the provision of the Act (Chapter on conduct of business powers and duties of the market committee). Monopolistic tendencies and practices have prevented development of free and competitive trade in primary markets future markets ( or secondary markets ) use of new tools and techniques in pre harvest management and post harvest management in handling exports agro based industries ware housing etc . The prominent activities like grading standardization scientific storage linked with finance search for suitable markets for excess of marketable surplus education of farmers in pre and post harvest management and facilities in the markets have become secondary activities. Marketing development funds have been siphoned to public ledger account by the state authorities adversely effecting modernization and infrastructure development vital for operational efficiency.

- The ever increasing production spread of latest technologies changing socio economic environment increasing demand for downsizing the distribution chain reducing the marketing margins between the producers and the ultimate consumers' challenges emerging out of liberalization and globalization in the post WTO period required a vibrant dynamic and assimilative marketing structure and system.

**Conclusion:** The present study concluded that, the in order to avoid isolation of small scale farmers from the benefits of agricultural produce they need to be integrated and informed with the market knowledge like fluctuations, demand and supply concepts which are core of economy. Marketing of agriculture can be made effective if it is looked from the collective and integrative efforts from various quarters by addressing to farmers, middlemen, researchers and administrators.

## **E-BANKING, ADVANTAGES & DISADVANTAGES**

**Dr. Wakale G. E.**

*Asstt. Professor, Economics Deptt. NSPM's BRD Arts & Com. Mahila Mahavidyalaya, Nashik Road*

### **INTRODUCTION:**

As commercialization of the internet evolved in the early 1990s, traditional “bricks and mortar” banks began to investigate ways of delivering limited online services to reduce operating costs. The success of these early efforts led many banks to expand their internet presence with improved websites that featured the ability to open new accounts, download forms and process loan applications. The next stage of development was the arrival of internet-only banks that offered online banking and other financial products and services without a network of branch offices. These so-called “virtual” or “direct” banks were able to pass savings in labour and overhead costs on to their customers by offering higher interest rates on deposit accounts, lower loan costs and reduces service fees. The first fully-functional direct bank, in U.S.A., insured by the FDIC was the Security First Network Bank. Based in Atlanta, it began operations on October 18, 1995. While it was not very profitable before it was bought out three years later, it proved the feasibility of the virtual bank concept. Online banking solutions have many features and capabilities in common but traditionally also have some features that are application specific.

**INTERNET BANKING SECURITY** Internet banking is a new specific banking area, part of e-banking industry, which allows people to interact with their banking accounts virtually from anywhere in the world. Internet banking addresses few emerging trends such as customer demand for any time, anywhere services, product time to market essentials, and increasingly complex back-office integration challenges. One such challenge is the security of online financial transactions. In order for the industry to develop further, secure transactions with the trust of the customers are necessary aspects. Many banks advertise secure online services, and allow their customers to do a wide range of banking activities. Some of the security features in internet banking usage include:

**THE ADVANTAGES OF INTERNET BANKING:** Many banks have begun to offer customers the option of online-internet banking, a practice that has advantages for both all parties involved. The convenience of being able to access accounts at any time as well as the ability to perform transactions without visiting a local branch, draw many people to be involved. Some of these advantages of internet banking but are not limited to, include:

1. **Customer’s convenience:** Direct banks are open for business anywhere there is an internet connection. They are also 24 hours a day, 365 days a year open while if internet service is not available, customer services is normally provided around the clock via telephone. Real-time account balances and information are available at the touch of a few buttons thus, making banking faster, easier and more efficient. In addition, updating and maintaining a direct account is easy since it takes only a few minutes to change the mailing address, order additional checks and be informed for market interest rates.

2. **More efficient rates:** The lack of significant infrastructure and overhead costs allow direct banks to pay higher interest rates on savings and charge lower mortgage and loan rates. Some offer high-yield checking accounts, highyield certificate of deposits (CDs), and even no-penalty CDs for early withdrawal. In addition, some accounts can be opened with no minimum deposits and carry no minimum balance or service fees.

### **Volume 1 Issue 1 / December 2011**

3. **Services:** Direct banks typically have more robust websites that offer a comprehensive set of features that may not be found on the websites of traditional banks. These include functional budgeting and forecasting tools, financial planning capabilities, investment analysis tools, loan calculators and equity trading platforms. In addition, they offer free online bill payments, online tax forms and tax preparation.

4. **Mobility:** Internet banking also includes mobile capabilities. New applications are continually being created to expand and improve this capability or smart-phones and other mobile devices.

5. **Transfers:** Accounts can be automatically funded from a traditional bank account via electronic transfer. Most direct banks offer unlimited transfers at no cost, including those destined for outside financial institutions. They will also accept direct deposits and withdrawals that the customer authorizes such as payroll deposits and automatic bill payment.

6. **Ease of use:** Online accounts are easy to set up and require no more information than a traditional bank account. Many offer the option of inputting the customer's data online or downloading the forms and mailing them in. If the customer runs into a problem, he has the option of calling or e-mailing the bank directly.

7. **Environment friendly:** Internet banking is also environmentally friendly. Electronic transmissions require no paper, reduce vehicle traffic and are virtually pollution-free. They also eliminate the need for buildings and office equipment.

**THE DISADVANTAGES OF INTERNET BANKING:** Internet banking seems like an obvious choice to leave the hassles of traditional money management behind in exchange for it. However, there are potential problems associated with banking over the internet of which customers may not be aware. Consumers need to weigh the advantages as well as the disadvantages of internet banking before signing up. Some of the disadvantages of internet banking include:

1. **Bank relationship:** A traditional bank provides the opportunity to develop a personal relationship with that bank. Getting to know the people at your local branch can be an advantage when a customer needs a loan or a special service that is not normally offered to the public. A bank manager usually has some discretion in changing the terms of customer's account if the customer's personal circumstances change. They can help customers solve problems such as reversing an undeserved fee. The banker also will get to know the customer and his unique needs. If the customer has a business account, this personal relationship may help if the customer needs capital to expand. It's easier to get the bank's support if there is someone who understands customer's business and vouch for his operating plan.

2. **Transaction issues:** Sometimes a face-to-face meeting is required to complete complex transactions and address complicated problems. A traditional bank can host meetings and call in experts to solve a specific issue. Moreover, international transactions may be more difficult (or impossible) with some direct banks. If a customer deposits cash on a regular basis, a traditional bank with a drive-through window may be more practical and efficient.

3. **Service issues:** Some direct banks may not offer all the comprehensive financial services such as insurance and brokerage accounts that traditional banks offer. Traditional banks sometimes offer special services to loyal customers such as preferred rates and investment advice at no extra charge. In addition, routine services such as notarization and bank signature guarantee are not available online. These services are required for many financial and legal transactions.

4. **Security:** Direct banks are subject to the same laws and regulations as traditional banks and accounts are protected by the FDIC. Sophisticated encryption software is designed to protect your account information but no system is perfect. Accounts may be subject to phishing, hacker attacks, malware and other unauthorized activity. Most banks now make scanned copies of cleared checks available online which helps to avoid and identify check fraud. It enables verification that all checks are signed by the customer and that dollar or euro amounts have not been changed. The timely discovery of discrepancies can be reported and investigated immediately.

#### **Volume 1 Issue 1 / December 2011**

**CONCLUSIONS:** The rise of internet banks has increased the competition of the banking business. Since both, internet and "brick-and-mortar" banks offer unique benefits and drawbacks, it may not be wise for a potential future banking customer to do banking exclusively with either option. While it's not possible for everyone, the best thing may be to separate banking between both in-store and online services and enjoy the conveniences and savings of internet banks while maintaining the customer service and personal relationships that a physical branch can provide. Although the benefits of internet banking are undeniable, there are some inconveniences and concerns of which customers should be aware of. Many people have difficulty relying on the security of online transactions, fearing the very real possibility of identity theft. Identity theft is a significant concern, but some online banks take this risk more seriously than others. Before opening an online account, it's better for the customer to investigate the bank's security policies and protections to ensure they meet his expectations.

## **INNOVATIVE BUSINESS STRATEGIES ADOPTED BY ENTREPRENEURS IN NASHIK DISTRICT**

**Dr. Chintamani Avinash Ramesh**

*Assistant Professor, B. Y. K. (Sinnar) College of Commerce, Nashik*

**Introduction:** Innovation is essential factor for economic growth for any entrepreneurs. The need of innovations is intensively highlighted under current conditions in India. India adopted new economic policy known as LPG in July 1991 under the supervision of then Finance Minister, Dr. Manmohan Singh. This made tremendous impact on Indian economy and business. Liberalization and Globalization created intense competition not only for the Private Sector but for the Public Sector also. This forced many business organizations to change their internal as well as external working system for enhancing their market competitiveness. It includes customer support system, product design, utility of the product, marketing strategy, Human Resource Management etc. It gave birth to a number of new innovations in entrepreneurship. This changed entrepreneurial strategies through innovative practices. Innovation means introduction of new ideas and thoughts in various areas of business. These new ideas changed nature of internal business operations, external business operations, products and services. Therefore it became essential for entrepreneurs to find out innovative ideas for the success in their business. Now in India many companies have put benchmarks in their own field. Sapat Tea is one of the example of this. It has been working since 110 years. Kalnirnay Calendar, Dabur Chavanprash, Aakashwani Radio, Mahindra & Mahindra Ltd, BOSCH Plugs etc. are some better known examples. Knowingly or unknowingly they have become the part of every family. Innovation was the major part of their success. Without innovative practices it is not possible to satisfy changing wants of the customers. It is also difficult to sustain in cut throat competition in the market. Innovative practices could be in process innovation, product innovation, paradigm innovation and position innovation. All these are called as four P's of innovation. According to these four P's, product innovation could be new design of a car, introduction new scheme of loan or insurance or banking sector. Process innovation consist equipment used to produce car or other products, operations etc. Replacement of new product with old one is the example of position innovation. Paradigm innovation concerns the change (sometimes radical) in the way something is done in the organization. Innovative practice and entrepreneurship are two sides of the same coin. Without innovative practices no entrepreneur can sustain in the market for longer period.

### **Objectives:**

1. To understand the concept of entrepreneurship and innovation.
2. To know various innovative practices adopted by entrepreneurs in their business.
3. To know relationship between adoption of innovative practices and competition in the market.
4. To draw inferences from the result derived from adoption of innovative practices.

### **Scope & Limitations:**

1. This paper has covered only Nashik district as a geographical area.
2. Only innovative practices in the business and their relation with the competition are studied in this paper.
3. In this paper, researcher wants to know about majority type of innovative practices to be used by entrepreneurs in Nashik district and hence it is presented only with the help of table and graph.

### **Hypotheses:**

1. Cut throat competition has inspired innovations.
2. Product development is largely used area for innovative practices.

**Methodology:** This paper is based on primary and secondary data. Primary Data: this data is collected with the help of Structured Questionnaire, observation and field visit. Secondary data: Reference books, journal, magazines, authentic websites, industrial publications etc. are used for secondary information.

**Sampling:** Primary data is collected from various industrial units in Nashik district. Out of 5095 industries 3% sample i.e. 153 industries and 2.5% sample i.e. 127 industries are selected for first hypothesis and second hypothesis respectively.

### Conceptual Background:

**An Entrepreneur**

The entrepreneur was seen to be one who brought together the factors of production in such a way that new wealth was created.<sup>1</sup> A person or group of persons, who creates something new, undertakes risks, organizes production and handles economic activity<sup>7</sup>.

**Entrepreneurship** Entrepreneurship encompasses acts of organizational creation, renewal, or innovation that occur within or outside an existing organization.<sup>2</sup> Therefore entrepreneurship is a process of identifying business opportunities where new avenues can be discovered.

**Invention** An invention comprises novel solution(s) to one or more specific problems.<sup>3</sup> It is a process of finding out something new which was not previously existed.

**Innovation** Innovation consists of the generation of a new idea and its implementation into a new product, process, or service, leading to the dynamic growth of the national economy and the increase of employment as well as to a creation of pure profit for the innovative business enterprise.<sup>4</sup> It is purposeful and systematic application of invention in the business process.

**Innovative Practices** It is adoption of innovative ideas in all the areas of business for daily course of action.

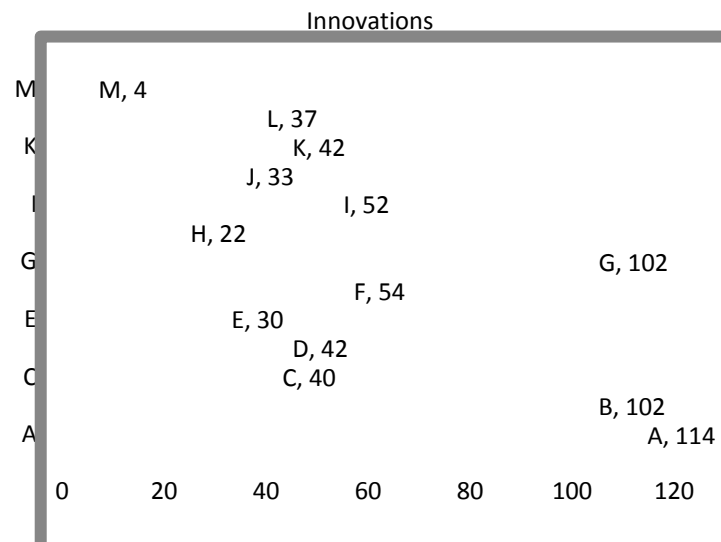

**Use of Innovative Practices in Different Areas of Business in Nashik district:** 127 respondents from the sample of 153 respondents who has been using innovative practices gave their opinions on different aspects of innovative practices. This question was multiple choice question and respondents register their responses for one or for more than one option. With the help of these questions, innovative practices will be understood.

Table No. 1: Innovative Practices in Business Areas

Codification	Areas of Business	Numberof Responses
A	Product Development	114
B	Production Process	102
C	Pricing	40
D	Distribution	42
E	Promotion	30
F	Service / After Sale Service	54
G	Technology	102
H	Finance	22
I	Management	52
J	HRD	33
K	Packaging	42
L	Infrastructure	37
M	Others	4

(Source: Primary Data)

Fig. No. 1: Innovative Practices in Business Areas

**Analysis and Interpretation:** Respondents who have accepted innovative practices in their business asked about different areas of business where they have adopted innovative practices. Product development has larger portion among other categories that has shown 17 percent share. Production process and technology occupies second ranking in overall categories have 15 percent share of both of them. Innovative practices adopted in Service / after sale service and management have 8 percent share. Other areas of innovation like pricing, distribution, promotion, finance, HRD, packing, infrastructure and other occupies 1percent to 5 percent share in overall portion.

**Observation:** Business organizations in Nashik district have used innovative practices in one or more than one business areas. Respondents from Nashik district use majority of the innovative practices in the areas of product development, production process and technology. Product, product related aspects and overall technology is important for these respondents. Innovative practices in other areas are comparatively less but entrepreneurs are considering these innovative practices one of the key elements of success.

**Innovative Practices and Competition in the Market:**

**Research Hypothesis:** Cut throat competition has inspired innovations.

**Null Hypothesis: H<sub>0</sub>:** Presence of competition in the market and use of innovative practices are independent.

**Alternate Hypothesis: H<sub>1</sub> :** There is association between presence of competition in the market and use of innovative practices.

**Cross Tabulation**

		Acceptance of Innovative Practices		Total	
		Yes	No		
Competition in the Market	Yes	Count	67	15	82
		Expected Count	50.8	31.2	82.0
	No	Count	16	36	52
		Expected Count	32.2	19.8	52.0
Total		Count	83	51	134
		Expected Count	83.0	51.0	134.0
Total N out of					153.00

**Results:** Value of  $\chi^2$  is 35.023 with 1 degree of freedom. Probability value  $p$  is <0.001.

If  $p$  is small, e.g. less than 0.01, or 0.001, the result is statistically significant i.e. there is significant relationship.

Yule's Coefficient of Association:  $Q = + 0.8190$

**Conclusion:** Hence Null Hypothesis is rejected and alternate hypothesis i.e. 'There is association between presence of competition in the market and use of innovative practices' is accepted. This supports and proves the first research hypothesis 'Cut throat competition has inspired innovation'. Coefficient of Association between Cut Throat Competition in the market and Acceptance of Innovative Practices shows strong positive relationship. It means there is positive association between cut throat competition and acceptance of innovative practices. This further supports and proves second research hypothesis.

**Findings:**

1. Maximum number of entrepreneurs in Nashik district have used innovative practices for product development. 114 responses are registered for product development area.
2. Production process and technology are the second largest area of business in which innovative practices are followed. 102 responses are received against these production process and technology area of business.
3. Responses for other option reside in the range of 22 to 54.
4. Very few innovation is taken into last category i.e. in other which is 4 in number.
5. In specific mentioned category, innovative practices used in finance was comparatively less in number. 22 responses are registered for innovative practices in finance.
6. According to Chi square test and Yule's Association of Coefficient tool, it is found that there is strong relation between cut - throat competition and acceptance of innovation.

**Suggestions:**

1. Management of finance is one of the important aspect in business organization. It is base to any innovation. Business organization should focus to make their financial process by way of introduction of innovative practices.
2. In case if there are any other areas of business which is not mentioned in this questionnaire then these areas should be specifically focuses and developed.
3. It is seen that product development is focused largely for innovative practices. Other areas are averagely focused. These areas should also be get focused.
4. Not every innovation get success in the market and therefore there should be accountability for successful innovation and unsuccessful innovation. This will help to manage organizational resources effectively.
5. There are many innovative tools which entrepreneur can adopt to face competition in the market. Attractive exhibition, internal waste management, mobile van or office for customers, easy customer feedback system etc. are some of the tools which can be implemented innovatively.

**Conclusion:** Industrial area in Nashik district is one of the largest industrial area in Maharashtra. It is observed that maximum number of entrepreneurs in Nashik district are using innovative practices in product development. Innovation in products are directly visible and can be identifies by customers in the market. To increase sales of the business product this innovation is useful for business organizations. Other business areas are comparatively less utilized for innovative practices but if these areas are used as equally as product development, then it will help business organizations to use their scare resources optimally. Cut throat competition in the market is the important reason behind accepting innovative practices in the business. Competition can be handle effectively if innovative tools are introduced.

## TEHSIL DEVELOPMENT INDEX: A STUDY OF NASHIK DISTRICT

**Dr.Sudhakar K. Pagar & Sambhaji R.Pagar**

*Head & Associate Professor, Dept. of Economics, SVKT College, Deolali Camp,  
Ph.D Research Scholar, Dept. of Economics, KTHM College, Nashik 422002*

The main objective of the economic policy since the beginning of the planning era has been self-sustained growth with equality. Government reiterated in its various plan documents the need for balanced regional development. But Regional disparities have increased over time in terms of economic, social and infrastructure development. Thus there is greater need for public action to address this problem. Planning process in this regard supported the importance of balanced regional development and adopted many policies for the reduction of regional disparities. To recognize or rectify this gap it needed comprehensive Index. Preparing development indices and mapping have become important analytical tools in development planning to identify the problem areas and sections/communities. The development indices, being a synthesis of several indicators, reflect real-world conditions more accurately and comprehensively than any single indicator such as per capita income, per capita consumption expenditure, literacy rate, etc. The indices are also useful in assessing holistic development. For example, the human development index (HDI) is considered a move towards human-centric development from economic/physical development. (G, 2016) Over the years, the Government of India (GoI) has prepared and used different kinds of development indices for various purposes through a number of expert committees. Among all those committees and indices, the *Report of the 'Committee for Evolving a Composite Development Index of States'* of the Ministry of Finance, GoI, is one of the recent reports and most comprehensive index. The Committee, chaired by the Dr Raghuram Rajan, used 13 indicators which were categorised into ten sub-components (sets of indicators) in preparing the states' development/backward index. The committee also used the indices to assess the performance of the states (see Government of India, 2013). There are very few indices prepared at district and sub-district level. In this regards attempt is made to prepare a comprehensive Taluka development indices in Nashik District. The methodology for selecting Development Indicator in the preparation of these indices had been developed by Bhaskar Rao G (Social Development Expert, UNICEF–CGG Support Team, Planning Department, Government of Telangana). The major objective of the Indices is to understand the development levels of Nashik districts and its Talukas in the state with respect to different dimensions of the development and to provide insights to the District development plan formulations and policy making.

### **Objectives:**

- 1) To finalise the methodology for Local or Block Level Development Index
- 2) To recognise the low developed Tahsil for giving more emphasis of this particular Tahsil.
- 3) To provide realistic base for financial allocation among the Tahsil & Block.
- 4) To provide insights for the balanced development of the districts.

**Methodology:** Directorate of Economics & Statistics is a Principal Statistical Organisation of State Government and is declared as "Nodal Agency" for all statistical activities in the State. Every year DES publish Economic Survey of State as well as District Level. In this District level survey, details of all household in the District has collected on various parameters. After reviewing data, 18 development indicators related to seven dimensions of development were selected for the Indices in this study. The dimensions are (1) Demographic Development (2) Agricultural Development, (3) Non Agricultural Development, (4) Gender Development, (4), (5) Education Development, (6) Household Amenities (7) Connectivity Development. Availability of the data is the major limiting factor in the selection of indices and dimensions.

After selecting the indicators, which are expressed in different units, they have to be converted into individual indices also known as normalisation in the range between 0 and 1. As we have used the goalposts in the preparation of indices of individual indicators, the formula would be:

**Index of indicator  $X_i = (\text{Actual value of } X_i - \text{Minimum Value of } X) / (\text{Maximum Value of } X - \text{Minimum Value of } X)$**

Where 'X' denotes a particular indicator and 'i' denotes a particular Tahsil

#### **Selection of Indicator:**

##### **A) Demographic Development**

i) **Population Density:** Population density, i.e., the number of people per one square km. There is correlation between population density and economic development. As the population usually moves from areas with low work and earning opportunities to areas with higher remunerative work and earning opportunities, high population density is considered as a development indicator.

ii) **Sex Ratio:** It is another general feature of demography. As in the Census, it is defined as number of women per 1000 men. Non SC-ST Population: As the Tahsil with higher of SC and ST population are considered vulnerable or in need of special attention, the indicator would associate inversely with the development index. Hence, the indicator defined in the inverse form, i.e., percentage of non-SC&ST population in the Tahsil,

iii) **Female Literacy Rate:** This Indicator reflects Female Literacy Rate as well as General Literacy Rate.

iv) **Non Agricultural Worker:** The work participation in Maharashtra, especially in the agricultural sectors, includes distress employment and disguised employment. Hence, non-agricultural work, which reflects the quality of the employment in a Tahsil, was included.

##### **B) Agricultural Development:**

i) **Chemical Fertilizer Consumption:** Higher Consumption of Chemical Fertilizer reflects higher Productivity. And Higher Agricultural Productivity reflects higher Agricultural Development.

ii) **Area under Forest Tree:** There is widespread recognition of the importance of ensuring that forests are sustainably managed to provide a range of products and environmental and social services in perpetuity. The need to reconcile the productive functions with the protective, environmental and social roles of forests was forcefully stressed by UNCED in 1992 in Chapter 11 ('Combating Deforestation') of Agenda 21, and in the 'Forest Principles'<sup>1</sup>.

iii) **Area Under Irrigation:** Water is essential for Agricultural Production. Higher Percentages of Area under Irrigation reflects higher Productivity and higher Agricultural Development.

##### **C) Non-Agricultural Development:**

i) **Consumption of Commercial Electricity:** Industrialisation and Commercialisation is the key of Overall Development. So researcher took percentages of total electricity consumption to Commercial Electricity consumption.

ii) **Urban Population:** Urbanisation provides a number of employment and income opportunities to the people and provides an interactive space with outside/ world and markets.

iii) **Loan Distribution to Non Agricultural Use:** Finance is the blood of Economy. Higher Loan Distribution reflect higher development.

##### **D) Gender Development:**

i) **Sex Ratio of Primary School:** Equal Sex ratio implies Gender Equality.

ii) **Sex Ratio of Junior College Student:** Equal Sex ratio implies Gender Equality

##### **E) Education Development :**

i) **Teacher Student Ratio of Primary School:** An adequate number of teachers in every school is considered as one of the quality indicators. Lower Ratio reflect the indicator would associate inversely with the development index. Hence, the indicator defined in the inverse form

ii) **School Dropout Ratio:** drop-out is someone who has left school or college before they have finished their studies. Lower Drop-out rate reflect Educational Development. , the indicator would associate inversely with the development index. Hence, the indicator defined in the inverse form.

##### **F) House hold Amenity:**

i) **House hold with Individual Latrine:** The use of latrines was a major advance in sanitation over more basic practices such as open defecation, and helped control the spread of many waterborne diseases.

ii) **Water Supply Availability in Premises:** The benefits of having a continuous, piped supply of safe drinking water delivered to household premises are widely recognised. Piped supplies on premises not only

reduce the time and effort required to collect water, and thereby increase the amount of water available for personal and domestic needs but also are more likely to provide water that meets required standards for drinking water quality.

**G) Connectivity Index:**

i) **Village Connected with all-weather Road:** Roads are providing better access to services, ease of transportation and freedom of movement to people.

ii) **Bus Connectivity:** The District overall development index value, which can be considered as the average of Taluk development indices and also the average of Tahsil development index, is 0 Table 1: Overall and dimensional development indices values at the Taluka level

FAO, (2010) The Development Criteria and Indicator for Sustainable Forest Management

**Table No. 1 Tahsil maximum and minimum values of district development and dimensional indices and coefficient of variance**

**Table No. 2 Tahsil maximum and minimum values of Tahsil development and dimensional indices and coefficient of variance**

Variable	Demographic Development Index	Agricultural Development Index	Non Agri. Development Index	Gender Development Index	Educational Development Index	Household Amenities Index	Connectivity Development Index	Overall Tahsil Development Index
Maximum	0.74833	0.59854	0.72652	0.71047	0.94420	0.87385	1.00000	0.63939
Minimum	0.17324	0.00000	0.00169	0.24725	0.44746	0.03657	0.10527	0.32661
STD	0.13866	0.19983	0.18058	0.13672	0.15289	0.23243	0.25587	0.07921
CV	0.01794	0.03727	0.03043	0.01745	0.02182	0.05042	0.06111	0.00586

**Limitation:** The two major sources of data used in the preparation of the Tahsil Development are the Census and the District Handbooks prepared and published by the District Chief Planning Officer, Nashik. While the Census data was available for 2011, other data i.e. Industrial Labour, Land Uses, HH having Latrine was also collected for the year 2011 from the Nashik District Handbooks and used. One of the challenges of this index, in fact, any indexing study, is that an index, by definition, reveals the quantitative aspect. To overcome this challenge researcher have included a greater number of indicators in the indices, which would reflect the quality aspects and outcomes, etc. One another challenges of this index is Data reliability. Selection of index may be biased. Or selected parameter is not giving actual reflection. To avoid complications Researcher did not use any weights in the preparation of the TDI indices from individual indices.

**Way forward** These indices are helpful in pin pointing the challenging Tahsil/ regions and block/ dimensions of development. Comprehensive indices could be constructed with available data at Tahsil and district level. Such indices would be very useful to monitor the progress of various development programme. Similar study may be possible with the help of more development indicator.

## **TRENDS OF INDIAN AGRICULTURAL PRODUCTIVITY: PERFORMANCE AND CHALLENGES**

**Asst. Prof. Deepak.P.Sontakke**

*Head, Department of Economics, New Arts Commerce and Science College, PARNER  
Tal. Parner, Dist. Ahmednagar*

**Introduction:** Agriculture is the core sector of Indian economy; it accounts for about 34.8 percent of the national income and provides livelihood to 66.7 percent of the working population of the country. Agriculture is commonly grouped with farming, mining, forestry and fisheries under the head of primary industries. The importance of agricultural sector of the economy, rich/poor, is borne out by the fact that it is primary sector of the economy which provides the basic ingredients necessary for the existence of mankind. History of economic development of various advanced nations shows that development of their secondary and tertiary sector to some extent was preceded by the development of agriculture. Agriculture is the backbone of our country. Major part of country's income/population earns its livelihood from agriculture. It has also been the source of raw materials to our leading industries such as sugar, cotton, jute, textiles, hydrogenated oils, soap and other agro-based industries which together accounts for 50 percent of the income generated in the manufacturing sector in India. A sustained and wide spread agricultural growth is pre condition of development of a country like India which is an agrarian economy. The slow growth in agriculture whether allied or non allied can be of great strain for the economy. While agriculture's share in India's economy has progressively declined to less than 15% due to the high growth rates of industrial and services sectors, the sector's importance in India's economic and social fabric goes well beyond this indicator. First, nearly three-quarters of India's families depend on rural incomes. Second, the majority of India's poor (some 770 million people or about 70 percent) are found in rural areas. And third, India's food security depends on producing cereal crops, as well as increasing its production of fruits, vegetables and milk to meet the demands of a growing population with rising incomes. To do so, a productive, competitive, diversified and sustainable agricultural sector will need to emerge at an accelerated pace. India is a global agricultural powerhouse. It is the world's largest producer of milk, pulses and spices, and has the world's largest cattle herd (buffaloes), as well as the largest under wheat, rice and cotton. It is the second largest producer of rice, wheat, cotton, sugarcane, farmed fish, sheep & goat meat, fruit, vegetables and tea. The country has some 195 m ha under cultivation of which some 63 percent are rain fed (roughly 125m ha) while 37 percent are irrigated (70m ha). In addition, forests cover some 65m ha of India's land (world bank report) At present in terms agricultural productivity, India hold second position. The agricultural production in India comprises of field crop, fruit plantation crop, livestock, forestry, fishery etc, but the pace of productivity is low in recent years, even many initiatives has been led by the government. Many schemes like RKVY, NADP, were launched by government to cope with the problem of slow pace of agricultural growth. India has wide capability to produce wide range of agricultural and allied products. Major crops of the area are paddy, wheat and maize. Manpower is also available in sufficient quantity which can be utilized properly for overall development of agricultural sector. Production of agriculture and allied sector has not been increasing over the past years which are major concerns for the authorities. Swot (strength's, weakness, opportunities and threats) analysis reveals the need and

potential of implementing different extension activities and need based projects to achieve the vision for the district. The productivity of crops has been declining which discourages the farmers from investing in the farming, there is a significant gap between actual and attainable yield. Agricultural production measured in terms of crop yield per hectare is comparatively low.

**Objectives and Methodology::** The Present Study is based on secondary source. Secondary data is collected from various Government of India Reports, RBI reports, Ministry of Agriculture reports, books, articles, and Economic Survey of India. In this background, the present study is to analyze the trends and pattern of agriculture growth and Production in India in specific the objectives are :

### Objectives

To understand the concept of agricultural productivity of India.

To study the significance of agricultural productivity.

To study of the direction of agricultural productivity trends.

**Indian Agriculture: Performance and Challenges:** India is the second largest producer of food in the world: more than 200 million tons of food grains, 150 million tonnes of fruit and vegetables, 91 million tonnes of milk, 1.6 tonnes of poultry meat, 417 million livestock and 6.05 million tonnes of fish and fish products. The Indian agriculture has made great strides over the years. The food grain production has increased more than fourfold – from 51 million tonnes in 1950-51 to 212 million tonnes during 2003-04 growing at an annual average rate of more than 2.4 percent per annum. India accounts for only about 2.4% of the world's geographical area and 4% of its water resources, but has to support about 17% of the world's human population and 15% of the livestock. Agriculture is an important sector of the Indian economy, accounting for 14% of the nation's GDP, about 11% of its exports, about half of the population still relies on agriculture as its principal source of income and it is a source of raw material for large number of industries. Acceleration the growth of agriculture production is therefore necessary not only to achieve an overall GDP target of 8 per cent during the 12<sup>th</sup> Plan and meet the rising demand for food, but also to increase incomes of those dependent on agriculture to ensure inclusiveness.

### Crop Production

#### Trends in Agricultural Production during Five Year Plans

(Average Production in Million Units)

Crop	First	Second	Third	Fourth	Fifth	Sixth	Seventh	Eight	Ninth	Tenth	Eleventh
Rice	25.0	30.3	35.1	41.8	47.3	54.5	65.1	78.7	87.3	85.6	97.3
Wheat	7.9	9.7	11.1	25.4	29.8	41.2	48.2	62.9	71.3	70.2	84.4
Jowar	7.5	8.7	8.8	8.3	10.8	11.3	10.90	10.7	7.9	7.2	7.0
Bajra	3.4	3.4	3.9	6.0	5.0	6.0	5.2	6.7	7.1	8.2	9.2
Maize	2.7	3.6	4.6	6.1	6.3	7.3	7.6	9.8	11.6	14.0	19.8
Other	6.6	6.5	6.3	6.4	7.1	6.0	5.4	4.9	4.5	3.6	4.0
Pulses	10.1	11.7	11.1	10.9	11.7	11.8	12.5	13.3	13.1	13.3	15.9
Total	63.2	74.0	81.0	103.0	118.1	138.1	115.0	189.0	202.9	202.2	237.4

Oilseeds	5.5	6.7	7.3	8.3	8.9	11.4	13.9	21.9	21.2	23.2	28.9
Sugarcane	55.3	80.3	1.9.2	123.1	153.3	174.9	196.4	258.4	292.4	277.0	325.8
Cotton	3.9	4.8	5.4	5.9	6.8	7.5	8.4	12.2	10.8	16.0	28.1
Jute	3.9	4.4	5.7	5.5	5.2	6.4	8.9	8.1	9.6	10.1	10.3

Source: Sury M M (2013): Five Year Plans of India, New Century Publications, New Delhi

Agricultural Production has two components food grains and non-food grains. The former contributes approximately two-thirds of total agricultural production. In the Number of agricultural Production ( triennium ending 1981-82=100), the weights assigned to food grains and non food grains are 62.9 and 37.1 respectively. The most important component in the food grains category is rice (weight 29.7) followed by wheat (weight 14.5). In non-food grains category, oilseeds constitute the most important group (weight 12.6). Sugarcane carries a weight of 8.1 while cotton carries a weight of 4.4. As far as food grains output is concerned, the total production increased from 50.8 million tonnes in 1950-51 to 187.0 million tonnes in the Eight plan and further to 202.9 million tonnes in Ninth Plan. 2002-03, the food grains output declined to 174.8 million tonnes but again rose to 213.2 in the second Plan and 11.1 million tonnes per annum in the Third Plan rose to 25 million tonnes per annum in the Fourth Plan. The momentum has been consistently maintained with wheat production averaging 84.4 million tonnes per annum in the Eleventh Plan. Wheat production has also picked up considerably since 1980s although there have been setbacks in some years. Rice production increased from 35.1 million tonnes in Third Plan to 97.03 million tonnes in Eleventh Plan. Rice production in 2007-12 estimated at a record level of 106.02 million tonnes. As is clear from Table 1.1 jowar and bajra have shown erratic trends over the planning period as a whole with production remaining almost stagnant for most of the time. Maize production which was 15.1 million tonnes in 2002-07 rose to as high as 22.3 million tonnes in 2007-12 and is expected to be 23.2 million tonnes in 2007-12. It is only in 2010-11 that this level was breached and the actual production of pulses rose to 18.2 million tonnes. It is estimated to touch the record level of 19.8 million tonnes in 2007-12. As far as the non-food grains group is concerned, the production of oilseeds rose considerably in the latter half of the 1980s, in certain years of 1990s and the first decade of the present century. For instance, oilseeds production increased from 12.7 million tonnes in 1987-88 to 18.6 million tonnes in 1990-91 and further to a level of 24.7 million tonnes in 1998-99. However, it fell thereafter and stood at only 14.8 million tonnes in 2002-03 but rose subsequently. It was 24.9 million tonnes in 2009-10 and touched the record level of 32.5 million tonnes in 2002-2007. In 2007-12, the production oilseeds declined to 30.9 million tonnes and is estimated at 33.0 million tonnes in 2013-12. However, just like pulses, **there is a large gap between demand and supply forcing the country to import large quantities of edible oils.** Production of cotton which averaged 12.2 million tonnes per annum in the Eight Plan and 10.1 million tonnes per annum in the Ninth Plan rose significantly in later years due to the widespread adoption of Bt cotton in 2002. From an average annual production of 16.0 million tonnes in the Tenth Plan period, the production rose to 34.2 million tonnes in 2002-07 and is estimated at 35.6 million tonnes in 2007-12. **Now almost 90% of cotton area is covered under Bt cotton.** In the non food grains group, jute has shown a slow and halting progress during the entire period of planning. As far as sugarcane production is concerned, it registered a more or less steady growth during the four decades period 1952-53 to 2002-03, but fell sharply in 2003-04 and

2004-05. In 2006-07, sugarcane production attained a high level of 355.5 million tones but declined in subsequent years. In 2009-10, it was a only 292.2 million tones but rose to the record level of 361.0 million tones in 2002-07. The production of sugarcane is estimated at 345.9 million in 2007-12.

**Cases of Low Productivity:** There is no single reason for low productivity in agriculture in India. The causes of low productivity are as giveb below:

**1. General Causes**

- i. **Excessive Pressure of Population on Land:** The heave pressure of population on land is caused by the limited growth of employment opportunities in the non-agricultural sector for rural people and rapid growth of rural population. The increasing population is largely responsible for subdivision, fragmentation of land holdings that result into low productivity of land.
- ii. **Social Environment:** The social environment in terms of illiteracy, superstitious attitude and unresponsive behavior towards the new technology is also a major limiting factor to the improvement in the agricultural productivity. Further, the human factory engaged in the agriculture sector is most unsatisfactory due to poor health and hygiene conditions.
- iii. **Land Degradation:** The increased land degradation is mainly due to the increased use of chemical fertilizers, and low quality of canal water. This has resulted into loss of nutrients in the lad and fall in productivity levels.
- iv. **Lack of General Infrastructural Facilities:** The economic rural infrastructural facilities are inadequate in terms of availability of road, transportation facilities, electricity and power.
- v. **Inadequate Agricultural Capital Formation:** Agriculture sector cannot make substantial contribution to the economic development of the country. The capital formation in the agricultural sector particularly the public capital formation in the agriculture sector is declining. The depressed capital formation has resulted into low agriculture productivity.

**2. Institutional Causes**

- i. **Defective Land Tenure System:** The exploitative character of land tenure system in the for of Zamindari system has reduced the capacity, incentive and motivation of the cultivators to improve productivity. The exploitative practices in terms of excessive rent, insecurity of land tenure and no land ownership rights causes cultivators to share large portion of output with land owners. This has resulted in lack of resources and interest of farmers to introduce technological improvements and thus increase productivity.
- ii. **Uneconomic Land Holdings:** The average land-holding in India is not only small in size but split into pieces and scattered due to sub-division and fragmentation of land. The average land-holding is just 2.3 hectares according to the latest agriculture census in India. This has resulted into the uneconomic lan holding making investments in improved technology and inputs unviable.
- iii. **Inadequate Credit and Marketing Facilities:** There has been a drastic reduction of institutional credit for agriculture. It is evident from the ace that the percentage share of agricultural credit, in the total credit of all scheduled commercial banks since the early 1990s has fallen compared to the levels, reached in the 1980s. Banks and financial institution are reluctant to provide financial assistance at fair rate of interest to farmers. The share of direct financing of farmers has declined tremendously. Thus, a large section of farmers has to depend upon non-institutional credit system (like moneylenders, and traders) that charge exorbitant rate of interest.

### 3. Technical Causes

**Technological Backwardness:** Most of farmers use traditional agriculture methods mainly due to paucity of finance. The use of high-yield variety seeds and fertilizers is very limited. Government has withdrawn from provisioning of HYV seeds developed in laboratory to the farms. Farmers have to pay exorbitant prices to the private suppliers for the low quality seed variety which has adverse consequences on the agricultural productivity.

**Increasing Input Cost:** The increase in the input cost due to reduction in subsidies for fertilizers and better seeds and increase in cost of power are responsible for the deceleration in the agriculture growth in the recent years.

**Inadequate Irrigation Facilities:** The vast proportion of cultivable land in India is rain-fed. Further, the infrastructure for irrigation is highly underdeveloped due to defective management as revealed by the fact that only 52.4 percent of the land was irrigated in the year 2003. As rainfall is often insufficient, uncertain and irregular, it leads to low productivity. Further, the Government's expenditure on irrigation coverage and flood control has witnessed a declining trend during the reform period.

**Conclusion:** From the above evidence we can conclude that overall performance of the Indian agriculture growth and production has shown the significant change in the last three decades. It reveals that the agriculture major crop has increase over the period of time. An average of 94.49 million tones of rice is produced annually which is higher than production of wheat, coarse cereals and pulses taken individually. However, it is less than annually average production of all food grain (2227.48 Million tones). Nonetheless, the variation in annual production of all food grains is significant standard Deviation value obtained of rice, cereals, wheat and pulses have increased comparatively over the last few years. This paper is mainly depends on the secondary sources of the different agriculture departments and planning commission.

## RECENT TRENDS IN BANKING SECTORS

**Dr. Ashok Vishwnath Ghorpade**

Asst. Prof. Dept. of Economics. New Arts, Commerce & Science College, Parner.

### **Abstract**

India's banking sectors has made rapid strides in reforming and make even itself to the new competitive business environment. Indian Banking Industry is in the midst of the information Technology evolution and its changes has put for competition among the Banks worldwide. Indian economic environment is witnessing pathbreaking reform measures. The financial sector, of which the banking industry is the largest player, has also been undergoing a orphic change. Today, we are having a fairly well developed banking system with different classes of banks – public sector banks, foreign banks, private sector banks – both old and new generation, regional rural banks and cooperative banks with the Reserve Bank of India as the fountain Head of the system.

**INTRODUCTION:** In 1969, a landmark was registered in the Indian Financial Sector, when 14 Banks were nationalized by the Centre. It is a matter of great pride to mention that during the economic meltdown in 2008-09, our Indian Bank stood firm and remained unaffected. This shocked the whole world as few Banks of the developed nations crumbled down but Indian Bank stood strong and also witnessed many positive developments in this industry. To improve the regulation in this sector, several notable efforts were made by the Policy Makers i.e. The Reserve Bank of India, Ministry of Finance and other Government and financial sector agencies. It must be appreciated that the Banks are in a position where Indian Banking Facilities meet the demands of the customers and are also adding to the economic development of the nation at large. India's Banking sector has made rapid strides in reforming and aligning itself to the new competitive business environment. Technology has swiftly turned as a boon to the customers.

### **Objectives Of The Study**

1. The main objective of the study is to understand Banking Sector
2. To understand the emerging technological trends in Banking Sector in India.
3. To trace the utility of technology in Banking with special reference to India.

**RESEARCH METHODOLOGY:** This Research Is Based On The Analysis Of these secondary data and the research proposes to throw light on the emerging technology trends in banking sector.

### **Recent Trends in Banking**

**1) Electronic Payment Services – E Cheques** Now-a-days we are hearing about e-governance, e-mail, e-commerce, e-tail etc. In the same manner, a new technology is being developed in US for introduction of e-cheque, which will eventually replace the conventional paper cheque. India, as harbinger to the introduction of e-cheque, the Negotiable Instruments Act has already been amended to include; Truncated cheque and E-cheque instruments.

**2) Real Time Gross Settlement (RTGS)** Real Time Gross Settlement system, introduced in India since March 2004, is a system through which electronics instructions can be given by banks to transfer funds from their account to the account of another bank. The RTGS system is maintained and operated by the RBI and provides a means of efficient and faster funds transfer among banks facilitating their financial operations. As the name suggests, funds transfer between banks takes place on a 'Real Time' basis. Therefore, money can reach the beneficiary instantaneously and the beneficiary's bank has the responsibility to credit the beneficiary's account within two hours.

**3) Electronic Funds Transfer (EFT)** Electronic Funds Transfer (EFT) is a system whereby anyone who wants to make payment to another person/company etc. can approach his bank and

make cash payment or give instructions/authorization to transfer funds directly from his own account to the bank account of the receiver/beneficiary. Complete details such as the receiver's name, bank account number, account type (savings or current account), bank name, city, branch name etc. should be furnished to the bank at the time of requesting for such transfers so that the amount reaches the beneficiaries' account correctly and faster. RBI is the service provider of EFT.

**4) Electronic Clearing Service (ECS)** Electronic Clearing Service is a retail payment system that can be used to make bulk payments/receipts of a similar nature especially where each individual payment is of a repetitive nature and of relatively smaller amount. This facility is meant for companies and government departments to make/receive large volumes of payments rather than for funds transfers by individuals.

**5) Automatic Teller Machine (ATM)** Automatic Teller Machine is the most popular device in India, which enables the customers to withdraw their money 24 hours a day 7 days a week. It is a device that allows customer who has an ATM card to perform routine banking transactions without interacting with a human teller. In addition to cash withdrawal, ATMs can be used for payment of utility bills, funds transfer between accounts, deposit of cheques and cash into accounts, balance enquiry etc.

**6) Point of Sale Terminal** Point of Sale Terminal is a computer terminal that is linked online to the computerized customer information files in a bank and magnetically encoded plastic transaction card that identifies the customer to the computer. During a transaction, the customer's account is debited and the retailer's account is credited by the computer for the amount of purchase.

**7) Tele Banking** Tele Banking facilitates the customer to do entire non-cash related banking on telephone. Under this device Automatic Voice Recorder is used for simpler queries and transactions. For complicated queries and transactions, manned phone terminals are used.

**8) Electronic Data Interchange (EDI)** Electronic Data Interchange is the electronic exchange of business documents like purchase order, invoices, shipping notices, receiving advices etc. in a standard, computer processed, universally accepted format between trading partners. EDI can also be used to transmit financial information and payments in electronic form.

**9) A focus on Mobile Banking:** As smartphones become even more widely used, it's no surprise that mobile-banking apps are increasingly popular. "For many people, mobile banking is the norm, especially if you skew younger, which is the future of banking."

**10) Better payment security :** High-profile data breaches in the past year, including at JP Morgan Chase and Home Depot, have made cyber security an even hotter topic in banking, especially when it comes to payments. EMV chips, which protect card data by encrypting it, will become standard in U.S. cards in October. Named for its developers (Euro Pay, MasterCard and Visa), EMV technology offers greater security than the vulnerable magnetic stripe and is already widely used outside the United States. Many consumers not only welcome these improved security measures, but also support other methods of ramping up privacy protection. Warshawsky says a recent Bank of America study showed that 60% of respondents said they were comfortable using a fingerprint to gain access to mobile banking apps, and about one in three were OK with retina scans and voice recognition as identity-authentication methods.

**11) More social interaction :** In 2015, banks may soon be more about sharing — and less about telemarketing — thanks to millennial. Among these Generation Y consumers who have bank accounts, 10% say they've used social networks to interact with their bank, according to Cap

Gemini's 2014 World Retail Banking Report. In the previous year's study, this metric wasn't even included, website All Analytics reports. This finding may help drive interest in more social banking products. "The new generation of customers does not want to take your phone call," researcher Dorsey advises bankers. But they may read a bank's texts, he says. With a growing focus on big data and analysis of consumer behavior, many banks are expanding their social-media presence and targeting potential customers with more personalized messages. Mobile apps such as Venmo and Snap cash are also seizing on opportunities to make payments more personal and shareable.

**12) D-Mat Accounts:** Transacting shares business through electronic media is called D-Mat. Investor opens an account called Demat Accounts with DPS. They get shares in electronic form. Then they send the actual shares to the investor. Investor pays for the opening, maintenance and collection of shares. This has reduced the paper work, bad deliveries; loss of shares and less transaction cost. However delays in demating, higher cost charged by the investors has not given a good start for the growth and scope of Demat in India. Depository.

**Conclusion:** Indian banking system will further grow in size and complexity while acting as an important agent of economic growth and intermingling different segments of the financial sector. AS banking in India will become more and more knowledge supported, capital will emerge as the finest assets of the banking system. Ultimately banking is people and not just figures. To conclude it all, the banking sector in India is progressing with the increased growth in customer base, due to the newly improved and innovative facilities offered by banks. The economic growth of the country is an indicator for the growth of the banking sector. The Indian economy is projected to grow at a rate of 5-6 percent the country's banking industry is expected to reflect this growth.

Dr. V.J. Joshi (581-584)

## New Option For Gross National Product (GNP) : Human Development Index

**Dr. V. J. Joshi**

Assistant Professor, Dept. of Economics, R.N. C. Arts, J. D. B. Commerce & N.S. C. Science College, Nashik Road, Nashik 422101.

### Abstract

Human Development Index is the new option for Gross National Product (GNP). It is helpful to measure economic development of an economy. According to Human Development Report, 2015 India deserve 130<sup>th</sup> rank amongst 188 countries. India is having 0.609 HDI as per the report. So India is a part of medium human development group Index of countries which is between 0.550 to 0.699 HDI. India, Nepal and Bangladesh belong to same group. Rather, Sri Lanka, China and Maldives belong to high human development group index of countries. Nepal and Pakistan are part of the below human development group Index of countries. HDI measures three dimensions – health, education and standard of living by using formula. Following paper focuses a light on all about the Human Development Index.

**Keywords** : United Nations Development Programme (UNDP), Human Development Report (HDR), Goalposts, Purchasing Power Parity (ppp), Gross National Product (GNP).

Human Development Index (HDI) is a measure of economic development of every country. Development redefines the enlargement of all human economic, social, political and cultural choices. Development is an extensive concept. The United Nations Development Programme (UNDP) introduced the Human Development Index in its report in 1990. Thus, since 1990 the Human Development Report (HDR) is annually published by UNDP. The working hand behind this well-known concept and report goes to Mr. Mahbub-ul-Haq and Amartya Sen. Mr. Mahbub-ul-Haq is known as “Father of Human Development Index”. He had given four important factors for economic development such as equity, sustainability, productivity and empowerment.

### Human Development Report's Themes

UNDP is extending working policies since, 1990 by applying different themes.

Human Development Report and their Themes since 1990

NO.	Year	Themes
1	1990	Concept & Measurement of Human Development
2	1991	Financing Human Development
3	1992	Global Dimensions of Human Development
4	1993	People's Participation
5	1994	New Dimensions of Human Security
6	1995	Gender & Human Development
7	1996	Economic Growth & Human Development
8	1997	Human Development to Eradicate Poverty
9	1998	Consumption for Human Development

10	1999	Globalization with a Human Face
11	2000	Human Rights & Human Developments
12	2001	Making New Technologies: work for Human Development
13	2002	Deepening Democracy in a Fragmented World
14	2003	MDGs : A Contract Among Nations to End Human Poverty
15	2004	Cultural Liberty in Today's Diverse World
16	2005	International Co-operation at a Crossroads: Aid, Trade and Security in a Unequal World
17	2006	Beyond scarcity: Power, Poverty and the Global Water Crises
18	2007/08	Fighting Climate change: Human Solidarity in a Divided World
19	2009	Overcoming Barriers: Human Mobility & Development
20	2010	Real Wealth of Nations: Pathways to Human Development
21	2011	Sustainability & Equity: A Better Future For All
22	2013	The Rise of The South : Human Progress in a Diverse World
23	2014	Sustaining Human Progress: Reducing Vulnerabilities & Building Resilience
24	2015	Rethinking Work for Human Development
25	2016	Human Development for Everyone

Source: Deepstambh, 7<sup>th</sup> Edition

**Measurement of Human Development Index :** HDI is the composite index of four social indicators or goalposts as shown below in the table: Goalposts for Calculating the HDI since 1990

Indicator	Maximum value	Minimum Value
Life Expectancy at Birth	85	25
Adult Literacy Rate	100	0
Gross Enrollment Ratio	100	0
GDP Per capita (ppp US \$)	40,000	100

Source: Indian and Global Economic Development pp. 5.5

Above table clears the idea of minimum and maximum values. Adult literacy rate subdivided into two parts namely adult literacy rate and combined primary, secondary and tertiary enrollment ratios. Purchasing Power Parity (ppp) per US Dollar focuses the light on GDP per Capita.

Goalposts for Calculating the HDI according to HDR 2016

Dimension	Indicator	Maximum value	Minimum Value
Health	Life Expectancy	85	20
Education	Expected Years of Schooling	18	0
	Mean Years of Schooling	15	0
Standard of living	Gross national Income Per Capita (ppp 2011 \$)	75,000	100

Source: Indian Economy 35<sup>th</sup> Edition, pp. 22

Due to medical facilities and advanced technology minimum age of a person supposed to be 20 years and maximum age of a person supposed to be 85years. Expected Years of Schooling starts from the day 1of the child- baby sitters, crush, mini K.G., play groups etc. At the most, every child should attend the school for the age of 15 years. Estimation suggests earning \$100 to \$75,000.

**Formula for measuring HDI:** By applying following formula we can expressed the performance of HDI for different dimensions.

Dimension Index = Actual Value - Minimum Value / Maximum Value - Minimum Value.

Example:

Life Expectancy Rate =  $80 - 30 / 85 - 25 = 50 / 60 = 0.8$

0 to 0.8 shows low HDI. 0.8 And above HDI shows High HDI. Index is equal to 1 shows very high HDI.

**Measurement of Human Development Index for Indian States**

HDI <sub>1</sub>	HDI <sub>2</sub>	HDI <sub>3</sub>	HDI <sub>4</sub>
Life Expectancy	Quality of Life	Population Above the Poverty Line	Urbanization
Per Capita State Domestic Product			
Literacy Rate			
Gross Enrollment Ratio			

Source: Indian and Global Economic Development pp. 5.7

Human Development Index for Indian States measured by different HDI levels or slabs which are mentioned above. From 1981, every after decade till 2001 Kerala stood first followed by Punjab. Whereas Maharashtra was rank in first five states of India. Bihar was lowest in the list. In 2007-08, Kerala was the first state in measuring the HDI followed by Delhi (Union Territory) with

HDI 0.790 and 0.750 respectively. Himachal Pradesh having 0.652, Goa 0.617, Punjab 0.605 and Maharashtra stood for fifth rank with 0.572 HDI as per the India's second HDI report 2011.

**Conclusion:** Human Development Index is the new option for Gross National Product (GNP). It is helpful to measure economic development of an economy. UNDP plays an important role in developing the concept –HDI. It is applicable to all types of an economies – developed, developing, undeveloped. UNDP is extending working policies since, 1990 by applying different themes. It measures three dimensions – health, education and standard of living by using formula. Then, the nation is aware about the actual value of HDI. According to the value, that nation or state's ranking is finalized.

## **INTERNET BANKING: AN EMERGENT AVENUE**

**Prof. More Y.S. & Prof. Shinde S.V.**

*Asst. Professor, ACS & BCS College, Ashvi*

**Introduction :** Banks have traditionally been in the forefront of harnessing technology to improve their products, services and efficiency. They have, over a long time, been using electronic and telecommunication networks for delivering a wide range of value added products and services. The delivery channels include direct dial – up connections, private networks, public networks etc and the devices include telephone, Personal Computers including the Automated Teller Machines, etc. With the popularity of PCs, easy access to Internet and World Wide Web (WWW), Internet is increasingly used by banks as a channel for receiving instructions and delivering their products and services to their customers. This form of banking is generally referred to as Internet Banking, although the range of products and services offered by different banks vary widely both in their content and sophistication. A new medium Internet is a vast network of individual computers and computer networks connected to and communicate with each other using the same communication protocol – TCP/IP (Transmission Control Protocol / Internet Protocol). When two or more computers are connected a network is created; connecting two or more networks create ‘inter-network’ or Internet. The Internet, as commonly understood, is the largest example of such a system. Internet is often and aptly described as ‘Information Superhighway’, a means to reach innumerable potential destinations. The destination can be any one of the connected networks and host computers.

### **General statistics:**

- 69 million Americans bank online
- 42 percent receive electronic checking account statements
- 56 percent paid a bill using online banking in the last month
- 19 percent of people have used mobile phone banking in the last year

### **Mobile banking statistics in the last year:**

- 90 percent of consumers checked an account balance or transaction using a mobile phone
- 48 percent have their financial institution’s mobile banking app downloaded
- 42 percent transferred money from one account to another
- 33 percent got a text message alert from their financial institution
- 26 percent used their financial institution’s website or app to pay a bill
- 11 percent used their mobile phone to deposit a check

### **Demographics of those who bank online:**

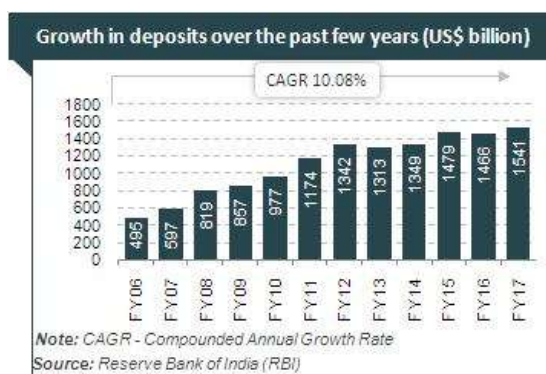

- 30 percent of consumers are between the ages of 30 and 44
- 20 percent are age 60 or older
- 63 percent of Internet-using women bank online
- 58 percent of Internet-using men bank online
- People earning less than an annual salary of \$25,000 were significantly less likely to use mobile banking
- People receiving more than an annual salary of \$100,000 were significantly more likely to use mobile banking

**How online banking is growing:**

- In 2010, 55 percent of 18-29 year olds said they banked online. In 2013, it was up to 66 percent
- In 2010, 26 percent of U.S. adults said they prefer to bank online. In 2013, it was up to 39 percent
- In 2010, three percent said they prefer to bank on a mobile device. In 2013, it was up to six percent

**Growth in Banking Sector Deposits**

- During FY06–17, deposits grew at a CAGR of 12.03 per cent and reached 1.54 trillion by FY17.
- Strong growth in savings amid rising disposable income levels are the major factors influencing deposit growth.
- Access to banking system has also improved over the years due to persistent government efforts to promote banking-technology and promote expansion in unbanked and non-metropolitan regions.
- At the same time India's banking sector has remained stable despite global upheavals, thereby retaining public confidence over the years.
- Deposits under Pradhan Mantri Jan Dhan Yojana (PMJDY), have also increased. As on November 9, 2016, US\$ 6,971.68 million were deposited, while 255.1 million accounts were opened

**Government Initiatives**

- Under Pradhan Mantri Jan Dhan Yojana (PMJDY), the total number of accounts opened since January 2015 increased 135 per cent to 295.2 million as of August 16, 2017.
- Mr Arun Jaitley, Minister of Finance, Government of India, introduced 'The Banking Regulation (Amendment) Bill, 2017', which will replace the Banking Regulation (Amendment) Ordinance, 2017, to allow the Reserve Bank of India (RBI) to guide banks for resolving the problems of stressed assets.
- Finance Minister Mr Arun Jaitley has proposed various measures to quicken India's transition to a cashless economy, including a ban on cash transactions over Rs 200,000 (US\$ 3,100), tax incentives for creation of a cashless infrastructure, promoting greater usage of non-cash modes of payments, and making Aadhaar-based payments more widespread.

- The Government of India has announced demonetisation of high denomination bank notes of Rs 1000 and Rs 500, with effect from November 08, 2016, in order to eliminate black money and the growing menace of fake Indian currency notes, thereby creating opportunities for improvement in economic growth.
- The RBI has cut its key repo rate by 25 basis points to 6.25 per cent, in order to boost growth as according to RBI, the inflation momentum has moderated because of a normal monsoon.

The government and the regulator have undertaken several measures to strengthen the Indian banking sector.

- Government of India has decided to amend Section 35 A of the Banking Regulation Act that will allow the Reserve Bank of India (RBI) to direct banks for the recovery of non-performing assets (NPAs)
- The Reserve Bank of India (RBI) has proactively instructed banks to increase their levels of provision on the loans provided to the telecom sector as a prudent measure, which will help to shore up provisions for future recognition of any non-performing assets arising out of the sector.
- The RBI has allowed banks in India to raise funds through issuance of rupee-denominated bonds overseas, also called masala bonds, within the current limit of Rs 2,44,323 crore (US\$ 36.6 billion) set for foreign investment in corporate bonds.
- The Ministry of Labour and Employment has successfully opened around 3,840,863 bank accounts as on December 26, 2016, for workers especially in the unorganised sector, as part of its campaign to promote and ensure cashless transfer of wages to workers.
- The National Bank for Agriculture and Rural Development (NABARD) plans to provide around 200,000 point-of-sale (PoS) machines in 100,000 villages and distribute RuPay cards to over 34 million farmers across India, to enable farmers to undertake cashless transactions.
- The Government of India's indigenous digital payments application, BHIM (Bharat Interface for Money), has recorded 18 million downloads since its launch on December 30, 2016, according to Mr Amitabh Kant, Chief Executive Officer, NITI Aayog.
- The Ministry of Finance has lowered the threshold for making electronic payments to suppliers, contractors or institutions from Rs 10,000 (US\$ 150) to Rs 5,000 (US\$ 75), in order to attain the goal of complete digitisation of government payments.

**Conclusion:** The Indian banking system consists of 27 public sector banks, 26 private sector banks, 46 foreign banks, 56 regional rural banks, 1,574 urban cooperative banks and 93,913 rural cooperative banks, in addition to cooperative credit institutions. Public-sector banks control more than 70 per cent of the banking system assets, thereby leaving a comparatively smaller share for its private peers. Banks are also encouraging their customers to manage their finances using mobile phones.

## **STRESS MANAGEMENT: DIFFRENT METHODS TO MINISIZE STRESS**

**Dr. Kamal R. Dhakane**

*Associate Professor in Zoology, S.M.B.S. Thorat College of Art's, Science and Commerce, Sangamner, Dist-Ahmednagar.*

**Introduction:** "Any external or internal event that has harmful effect on mind & body is stress" Stress is epidemic in the present world. Stress is a state of tension that is created when a person responds to the demands and pressures that come from work, family and other external sources, as well as those that are internally generated from self imposed demands, obligations and self-criticism. It adds up over time until a state of crisis is reached and symptoms appear. These symptoms may manifest themselves psychologically as irritability, anxiety, impaired concentration, mental confusion, poor judgment, frustration and anger. They may appear as physical symptoms. Common physical symptoms of stress include muscle tension, headaches, low back pain, insomnia and high blood pressure. If untreated, these symptoms may lead to physical illness and sometimes death too. Stress can generate a chain of reactions leading to organic diseases. Pituitary hormones are also governed by the hypothalamus that secretes releasing and inhibiting factors for pituitary hormones. Thus the hypothalamus is the master of the endocrine system. Slight over activity of parasympathetic system is good for health. Excessive stimulation of parasympathetic system however, is hazardous to health. Thought initially it acts as a brake, it later on changes into reverse gear. , Thus mental tension reduces both cellular and hormonal immunity and one easily gets susceptible to infective organisms Often people become so accustomed to stress that they become unaware of it. Many of us suffer the debilitating effects of stress even though we don't feel tense. Stress can change the way you treat others or damage your body even in the absence of feelings of frustration or anxiety. Many ordinary individuals experience the constant stress of worry, leading unfulfilled lives or of not being what they would like to be. Further they think that stress is something which affects only those who have high pressure lives. Stress comes from the way we perceive the world, not from the way the world really is. To paraphrase of Stock Epictetus -" it is not events in themselves that cause our distress but rather the views we take of the events. We can change home.

**Types of stress:** There are various types of stress such as Occupational stress, Psycho- somatic stress and family stress.

**Occupational Stress:** For some of us, a job is a labor of love. For others, it's the sole means by which we support our families. And for many, a job can be an overwhelming source of stress. We face a variety of situations at work and there is a commonality to those which cause us the most stress. Whether it's being laid off, dealing with a boss, having anxiety about job security or coping with an excessive workload, things happen every day at work that can result in undue stress on our emotions.

**Psycho somatic Stress:** Psychosomatic means mind (psyche) and body (soma). A psychosomatic disorder is a disease which involves both mind and body. Some physical diseases We thought to be particularly prone to be made worse by mental factors such as stress and anxiety. Your current mental state can affect how bad a physical disease is at any given time.

**Family stress:** The mind affects the body. Students studying for a test are at higher risk for becoming ill closer to the time of the exam; persons who have suffered from a heart attack recover more quickly if their emotional state is stronger and persons with terminal enjoy a higher quality of life if they are surrounded by friends and family. You're not alone....there are people who can help you and your loved ones learn how to cope and live with a chronic illness.Families are the primary source of love, joy, warmth and togetherness in our lives. And yet, family life is also full of many challenging problems and conflicts. If your family is facing a difficult time, a psychologist may be able to help.

**Signs and symptoms of stress**

c) Mental signs of stress, Tension, Tightness, Resistance, Friction, Anger, Guilt Criticism, Tiredness, Anxiety, Evasion, Reaction, Discontentment, Worry, Impatience, Apprehension. d) Physical signs of stress , Increased heart beat High blood pressure, Digestive disturbance, Diarrhoea, Sweating, Heart attack, Ulcers, Headache, Chest pain, Insomnia, Accident proneness, Alcoholism,e) Behavioral signs of stress, Biting one's nails, Pulling hair, Grinding the teeth, Speech incoherence, Wagging legs when crossed, Withdrawal or isolating oneself, High pitched nervous laughter, Insomnia, Accident proneness, Yelling or screaming at others, Increased smoking, Increased use of drugs & alcohol, Over eating or eating less

**Stress free living:** Managing stress is all about taking charge: taking charge of our thoughts, our emotions, our schedule, our environment and the way we deal with the problems. The ultimate goal is a balanced life with time for work, relationships, relaxation and fun plus the resilience to hold up under pressure and meet the challenges head on .It starts with identifying the sources of stress in our life. This isn't as easy as it sounds. Our true sources of stress are not always obvious, and it's all too easy to overlook our own stress inducing thoughts, feelings, and behaviors. We may know that we are constantly worried about work deadlines. But maybe it's our procrastination rather than the actual job demands that leads to deadline stress.A wrong lifestyle may not inadvertently result in increased amount of stress. However, it can definitely hamper our physical and mental ability to recover from the stress which we otherwise accumulate. Hence, it is best to adopt a stress free lifestyle which gives us ample time to unwind our mind and body. Here is how we can do it: Define our real goals in life and act in a way which would help us to fulfill them. Strike a balance between our family, personal life and our work. Though it is not easy to prioritize, there are certain rules which can help us to prioritize things. Sleep for at least six hours a day. It is the most natural way to de-stress your life. Stay physically active. Do some physical exercise to spend the accumulated energy inside your body. You can de-stress yourself by doing so. Eat healthy foods. We can stay fit from a healthy diet and this can help us to remain stress free as well.Time management has an important role to play in de-stressing our life. Time management is an absolute must if we have to accomplish tasks on hand. Better time management skills can help us with relaxing or doing more tasks that we intended to do in our life. Do the following for better time management: Prioritize things when it comes to allocating time. Deal with important things first, Stay focused while working. This would allow you to complete tasks in time. If tasks are left unfinished, either leave them completely or devote some extra time. However, do not postpone them to the future. This would reduce the amount of time on hand in the future.Not talking or sharing our feelings with any one leads to unnecessary stress. Hence, de-stress ourselves by having our family and friends around. They can become vital support systems which can help us during the times of crisis. Join friendship clubs if we do not have anybody familiar around us. A negative attitude towards things in life can increase a lot of stress in our life. A positive attitude can help us in not just looking at things from a fresh perspective but also approach them with. Stress symptoms include mental, social and physical manifestations. These include exhaustion, loss of/increased appetite, headaches, crying, sleeplessness and oversleeping. Escape through alcohol, drugs, or other compulsive behavior are often indications. Feelings of alarm, frustration or apathy may accompany stress. Until we accept responsibility for the role we play in creating or maintaining it, our stress level will remain outside our control. The causes of stress have to be found out to manage stress. The following are some wonderful ways to reduce stress, anxiety and depression and promote relaxation, calm and peace within us. Some techniques take practice and most require some commitment on our part to achieve results. However, the results are well worth an effort, as a calm and relaxed body and mind are less prone to health issues than an agitated body and mind. We cannot do away with stress in any manner whatsoever.

However, stress can be managed in a few easy ways.

1) Breathing strongly influences mind, body and moods. By simply focusing our attention on our breathing and without doing anything to change it, we move in the direction of relaxation.

- 2) Progressive relaxation is a way of releasing tension in muscles leading to stress reduction.
- 3) For many people, exercise is their main method of coping with stress and promoting relaxation. One of the benefits of regular aerobic exercise is its moderating effect on emotions.
- 4) For a wonderful relaxing experience, get a massage or other form of body work.
- 5) Visualization and guided imagination are important stress management tools. Only a few of us have learned how to develop our imaging capacity and take advantage of its ability to affect our minds and bodies.
- 6) Meditation means directed concentration. Mediators learn to focus awareness and direct it onto an object: the breath, a phrase or word repeated silently, a memorized inspirational passage or an image in the mind's eye.
- 7) Make a list of the top five priorities in your life now. Rank these in order of importance. When you're stressed and overwhelmed, revisit these priorities and remind yourself what's most important to you.
- 8) Put things in right perspective.
- 9) Think about how important whatever is stressing you will be in a week, a month or a year from now. Look at the big picture.
- 10) Simplify your life. What do you put up with or take on? What annoys you? Let go of the things you have no control over. Deal with the things you can do something about to the best of your ability.
- 11) Stress is a messenger, listen to it and learn from it, we will grow to love it.
- 12) Stress has negative effects when we take it as a threat and it has positive effects if we consider it as a challenge. Choose the latter.
- 13) When confronted with stress, avoid complaining, blaming people or circumstances, instead keep busy with various activities that are under your control.
- 14) Stress is not frightful. Meet, greet & beat it successfully.
- 15) There are always at least a few direct or indirect advantages in every event of our life. Make it a habit of pondering over those advantages however small they may be.
- 16) Don't feel sorry about what we have done yesterday because now yesterday is not in our hands. Yesterday is dead. Also do not worry about tomorrow. Tomorrow is yet to be born. Only today is in our hands. Put all efforts in making our today positive & successful.
- 17) Don't feel inferior by comparing our self with others. Remember that we are unique persons in this world.
- 18) Consider our critics as our well wishers. By describing our weaknesses and drawbacks they are acting as psychotherapists without taking any fees.
- 19) Forgive all those people who have created hurdles in your life and made it more difficult to live. Unless we take this positive step, we won't be able to forget all those unhappy and painful incidents.
- 20) Don't try to solve many problems at a time. Divide all our problems in the form of compartments. Open only one compartment at a time, when we are free from more productive work.
- 21) Whenever possible, spare some time to help others. By rendering services to others our worries, tensions and anxieties will definitely be minimized.
- 22) Have a positive attitude towards day to day events. By changing our attitude, we can transform pain into pleasure, sorrow into happiness & criticism into blessing.
- 23) In spite of putting all efforts, if we cannot change a situation, do not feel unhappy and depressed about it. Remember that time is the best healer.
- 24) This world is huge drama in which we are all actors playing the specific role allotted to each one of us. Hence, don't feel anxious by observing the scenes related to tragedy, sorrow and friction.

25) Don't think of taking revenge but put efforts to transform oneself. The thoughts of revenge will only increase our mental stress. The efforts put in self transformation will definitely bring peace, progress & prosperity.

26) Even a subtle ego can generate expectations leading to mental ups & downs. Therefore in order to achieve stability of mind give up ego. Remember we came to this world with empty hands & we are going to leave this world with empty hands only.

27) Make it a rule to observe our thought pattern for a couple of minutes a day. Such a practice will prevent unwanted & unnecessary thoughts.

28) Don't feel jealous about others. Instead churn the gems of spiritual wisdom. Jealousy burns our mind and body but spiritual wisdom will bring us solace, comfort and satisfaction.

29) When we give happiness to someone, happiness comes back to us with the same intensity. Hence always give happiness to others. Never even think of giving unhappiness to anyone.

30) While facing problems and difficulties, think that we are paying debts to our past actions. Hence, feel happy about it.

31) Surrender all of our worries to the Supreme.

32) Practice meditation for 15 to 20 minutes daily. Meditation takes us beyond relaxation response & brings several physiological benefits. It is the source of health, happiness & harmony.

**Conclusion** - Managing stress at work means learning to manage situations differently; but it also means learning how to manage oneself, knowing one's resources and making better use of one's personal abilities. Knowing how to manage stress at work or in any professional and personal context depends not only on external situations, but on our way of perceiving and understanding them.

## TRIBAL POPULATION CONCENTRATION IN NASHIK DISTRICT, MAHARASHTRA

Sunita Kalnar & Dr.Wavale Vijaykumar G.

Associate Professor, HPT Arts, RYK Science College Nashik

Research student

### **Abstract**

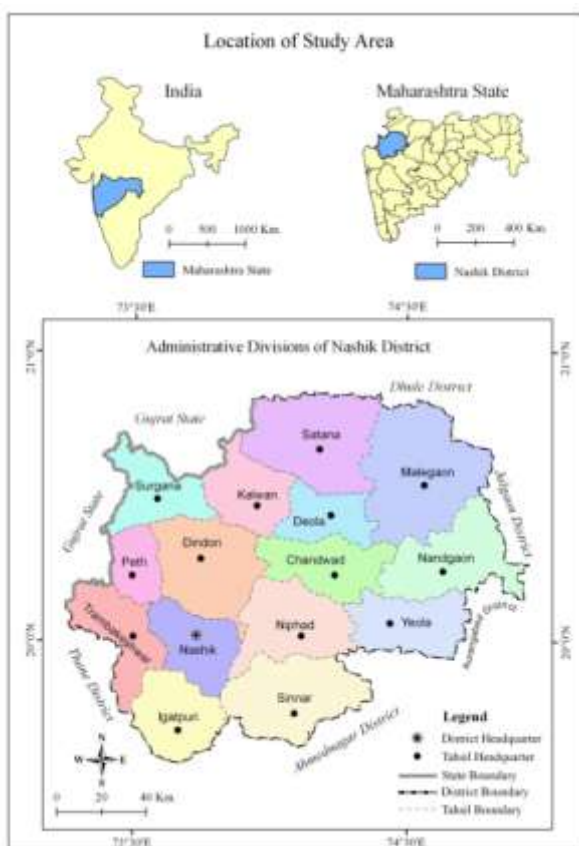

The present paper based on the 1981-2011 Census data insights into the concentration of tribal population in Nashik district, Maharashtra and India. Apart from this, the percentage distribution of tribal population has also been worked out and depicted on the map to highlight their concentration in different districts, both for 1981 and 2011. In 1981 the high concentration of tribal population was recorded in Peint (3.99) tahsil and Yevola (0.29) tahsil have showing less tribal concentration. In 2011 the high concentration of tribal population was recorded in Surgana tahsil (3.77) and Yevola (0.41) tahsil having less tribal concentration. According to 2011 census high tribal concentration of tribal population was recorded in Nandurbar (7.41) district and lowest tribal concentration index was found in Sangali (0.07) district.

**Introduction:** The tribal people, popularly known as 'Adivasis' are scattered all over the world except the European continent. The largest concentration can be found in the African continent and the second largest concentration is in India. The total population of tribals in India is more than 67.6 million, which is nearly 8.6 percent of the total population of India. In fact, it is almost equal to the tribal population of nineteen countries with substantial population. The tribal population of India is more than the total population of France and Britain and four times that of Australia. If all the Tribals of India had lived in one state, it could have been the fifth most populous state after Uttar Pradesh, Bihar, West Bengal and Maharashtra. There are about 427 tribal communities scattered all over the country. The largest group comes from the Gonds, Santhals, Bhils, Orans, Hols, Mundas, Boro- Kacharis, Bhotias, Tharus, Kharwars, Jaunsaries and the Nagas, concentrated in the states of Assam, Andhra Pradesh, Bihar, Orissa, Gujarat, Madhya Pradesh, Rajasthan, Tripura, Maharashtra, Manipur, Arunachal Pradesh, Meghalaya, Uttar Pradesh, Nagaland and West Bengal.

**Study Area:** Nashik dist. of Maharashtra has been selected as the study area. Nashik District is situated partly in the Tapi basin and partly upper Godavari basin. It lies between 19° 33' to 20° 53' North latitude and 73° 15' to 75° 16' East Longitude. Nashik District has an area of 15,530 sq. km and population of 61, 07,187 as per the 2011 census. There are 15 tahsil were included in the Nashik District. The fifteen tahsils of the district include Satana, Deola, (created on 26.06.1999) Malegaon, Surgana, Kalwan, Peint, Dindori, Trimbakeshwar, (created on 26.06.1999) Igatpuri, Sinnar, Nashik, Yevala, Niphad, Chandvad Nandgaon (Fig ). Among these Malegaon is largest tahasil with 12% area and Peint is smallest tahasil with 3.63% area in the district. (Map No.1)

In the extreme north is selbari range, which approximately forms and boundary between Nashik and Dhule district. Next is the Satmala range which runs right across district. Kalsubai range is located in the south part of the district. The district is surrounded by Dhule district in the north. Jalgaon and Aurangabad district in the east. Ahmednagar district in the south and Thane district in the south-west and Gujarat state in the north-west. The district is drained by two chief rivers the Girna and the Godavari and their tributaries the watershed between these being the satmalas range. Apart from these there are a number of small konkan rivers draining west wards into the Arabian Sea

Map No.1

**Aims and Objectives:**

To The main objectives of the study are as follows:

1. To look into the concentration, of tribal population in Nashik District.
2. To look into the concentration, of tribal population in Maharashtra and India
3. To analyze the change in volume of tribal population concentration in Nashik district between 1981 and 2011 census.

**Sources of data:** For present study data regarding population have been collected at tahsil level for total and tribal population for the year 1981 and 2011. The data for study have been collected from District Census Handbook Nashik district for the year 1981 and 2011

**Methodology:** Ramotra (2011) the index of concentration of Tribal population is also calculated by using the location quotient Method (Mahmood 1977) as given below

$$L.Q = \frac{\text{Percent of tribal population to total population in a Tahsil}}{\text{Percent of tribal population to total population in a District}}$$

**Percent of tribal population to total population in a District**

Where the value of location quotient is beyond 1, the concentration of tribal population would be high and dispersed in the area where the value is less than 1 and where the value is exactly 1, and then it is balanced one. **Tribal Concentration Index in Nashik District:** The concentration of tribal population for each Tahsil in study region is calculated (Table No.1) for 1981 and 2011. In 1981 the high concentration of tribal population was recorded in Peint Tahsil (3.99) followed by Surgana (3.91), Dindori (2.10), Kalwan (2.11), Igatpuri (1.76) and Baglan (1.27) tahsils indicating more tribal concentration. It is observed that tribals are found in hilly and forest area. The remaining tahsils, namely Niphad (0.64), Chandwad (0.59), Nashik (0.56), Sinnar (0.43), Nandgaon (0.43), Malegaon (0.37) and Yeola (0.29) have value less than 1. It showing less tribal concentration. (Table No.1, Fig.No.2) In 2011 the high concentration of tribal population was recorded in Surgana Tahsil (3.77) followed by Peint (3.76), Trimbak (3.13), Kalwan (2.69), Dindori (2.17), Igatpuri (1.58) and Baglan (1.56) tahsils presenting very high tribal concentration and Deola, Malegaon, Nandgaon, Chandwad, Nashik, Sinnar, Niphad and Yeola tahsils have found value less than 1 it showing less tribal concentration. (Table No.1 Fig.No.2)

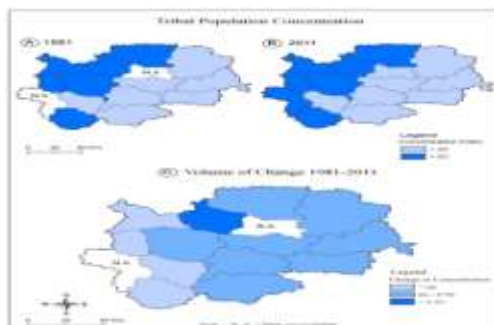

**Table No.3.5-Tribal Population Concentration Index in Nashik District 1981-2011**

Sr.No.	Name of Tahsil	Concentration index 1981	Concentration index 2011	Volume of change
1	Baglan	1.27	1.56	0.29

2	Chandwad	0.59	0.78	0.19
3	Deola	N.A	0.81	-
4	Dindori	2.10	2.17	0.07
5	Igatpuri	1.76	1.58	-0.18
6	Kalwan	2.11	2.69	0.58
7	Malegaon	0.37	0.39	0.2
8	Nandgaon	0.43	0.59	0.16
9	Nashik	0.56	<b>0.40</b>	-0.16
10	Niphad	0.64	0.75	0.11
11	Peint	<b>3.99</b>	<b>3.76</b>	-0.23
12	Sinnar	0.43	0.52	0.09
13	<b>Surgana</b>	<b>3.91</b>	<b>3.77</b>	-0.14
14	Trimbak	N.A.	3.13	-
15	Yeola	<b>0.29</b>	<b>0.41</b>	0.12
	<b>Nashik District</b>	<b>2.55</b>	<b>2.74</b>	<b>0.19</b>

Source: District Census Handbook Nashik District. Note i) N.A- Data Not Available ii) Computed by Researcher

It found slight increase of tribal concentration in Kalwan (0.58), Baglan (0.29), Chandwad (0.19), Nandgaon (0.16), Yeola (0.12), and Niphad (0.11) tahsils respectively. Peint (-0.23), Igatpuri (-0.18), Nashik (-0.16), and Surgana (-0.14) tahsils have decreased tribal concentration from 1981 to 2011. Tribal population is highly concentration in west part in the study region. (Table No.1 Fig.No.2. C). Tribal population concentration index decrease in Nashik (-0.16) Tahsil because of separation of Trimbak Tahsil from Nashik Tahsil. Peint (-0.23), Igatpuri (-0.18), Surgana (-0.14) tahsils have also decrease concentration index because of tribal people migrated for job to urban area.

**Fig. No. 3.7**

### 3.6.2 Tribal Concentration Index in Maharashtra:

The concentration of tribal population for each district in Maharashtra state is calculated. In 2011, the high concentration of tribal population was recorded in Nandurbar district (7.41). It followed by Gadchiroli (4.13), Dhule (3.37), Nashik (2.74), Yavatmal (1.98), and Chandrapur (1.88) districts indicating more tribal concentration. Jalgaon (1.53), Amravati (1.49), Wardha (1.22), Gondiya (1.73), Thane (1.49), Raigarh (1.23) districts concentration index

was recorded more than 1 value. Nagpur (1.00), Hingoli (1.02) was found exact 1 concentration index it means in that district tribal population are balanced. (Fig.No.3.8)

**Table No.3.6- Tribal concentration index in Maharashtra 2011**

Name of District	CI	Name of District	CI	Name of District	CI
Nandurbar	7.41	Jalgaon	1.53	Dhule	3.37
Buldhana	0.51	Akole	0.59	Washim	0.72
Amaravati	1.49	Wardha	1.22	Nagpur	1.00
Bhandara	0.79	Gondiya	1.73	Gadchiroli	4.13
Chandrapur	1.88	Yavatmal	1.98	Nanded	0.89
Hingoli	1.02	Parbhani	0.23	Jalna	0.23
Aurangabad	0.41	Nashik	2.74	Thane	1.49
Mumbai.su.	0.12	Mumbai	0.08	Rigarh	1.23
Pune	0.39	Ahmednagar	0.88	Beed	0.16
Osmanbad	0.23	Solapur	0.19	Satara	0.10
Ratanagiri	0.13	Sindudurgh	0.09	Kolhapur	0.08
Sangali	0.07	Latur	0.25	<b>Maharashtra</b>	<b>1.08</b>

Source- Population Census Abstract 2011- Maharashtra.

The remaining districts, Buldhana, Akole, Washim, Bhandara, Nanded, Parbhani, Jalna, Aurangabad, Mumbai, suburban Mumbai, Pune, Ahmednagar, Beed, Osmanabad, Solapur, Ratanagiri, Sindudurg, Kolhapur, Sangli, and Latur districts have value less than 1 showing less tribal concentration. In Maharashtra tribal population concentration value was 1.08 showing the tribal have balanced. (fig.No.3).

**Fig. No. 1.3**

**3.6.3) Tribal Concentration Index in India:** In 2011 in India the concentration of tribal population Lakshadweep (11.02) was recorded followed by Mizoram (10.98), Nagaland (10.05), Meghalaya (10.02), Arunachal Pradesh (7.99), Dadar & Nagar Haveli (6.04), Manipur (4.08), Sikkim (3.94), Tripura (3.69), Chhattisgarh (3.56), Jarkhand (3.04), Odisha (2.65), Madhya Pradesh (2.32), Jammu &

Kashmir (1.38), Rajasthan(1.56) ,Assam(1.44) ,Gujarat (1.71) and Goa (1.18) states presenting very high tribal concentration and Himachal Pradesh ,Uttarakhand ,Bihar ,West Bengal, Daman Div., Andhra Pradesh, Karnataka , Kerala, Pondicherry & A& N Islands was recorded less tribal concentration ( Appendix- L).

#### Conclusion:

1. Tribal Population is concentrated in physically contrary, rugged topography with high rainfall, dense forest, culturally in remote areas and irrigation is Poor. (Concentration index– Surgana (3.76), Trimbak (3.13), Kalwan (2.69), Dindori (2.17), Igatpuri (1.58), Baglan (1.56).
2. In 2011 in India the concentration of tribal population Lakshadweep (11.02) was recorded followed by Mizoram (10.98) ,Nagaland (10.05) ,Meghalaya (10.02) ,Arunachal Pradesh (7.99) ,Dadar& Nagar Haveli (6.04), Manipur (4.08) ,Sikkim (3.94), Tripura (3.69) ,Chhattisgarh (3.56),Jarkhand (3.04), Odisha (2.65), Madhya Pradesh (2.32) ,Jammu & Kashmir (1.38), Rajasthan(1.56) ,Assam(1.44) ,Gujarat (1.71) and Goa (1.18) states presenting very high tribal concentration
3. In 2011, the high concentration of tribal population was recorded in Nandurbar district (7.41).It followed by Gadchiroli (4.13) ,Dhule (3.37), Nashik (2.74) , Yavatmal (1.98), and Chandrapur (1.88) districts indicating more tribal concentration .Jalgaon (1.53),Amravati (1.49), Wardha (1.22), Gondiya (1.73), Thane (1.49),Raigarh (1.23) districts concentration index was recorded more than 1 value.

## **HIGHER EDUCATION IN INDIA: RECENT TRENDS, ISSUE & PUBLIC EXPENDITURE**

**Dr.Sandeep Vitthal Irole & Manisha Pandit Gunjal**

*Dept.of Economics, Art's,science & Commerce College,Rahuri ,Tal-Rahuri,Dist-Ahmednagar  
Ph.D. Research Students, Post Graduate Research Center, S.M.B.S.T.College Sangamner  
Tal-Sangamner,Dist-Ahmednagar*

**Introduction-** The importance of higher education has been clearly express by our first Prime Minister Mr. Jawaharlal Nehru In the following words “ A University stands for humanism for tolerance, for reason, for the adventure of the ideas & the search of truth. it Stand for onward March of human race towards even higher objective, if the universities discharge their duties adequately, then it well with nation & the people”.Education is recognized as one of the critical elements of the national development efforts & higher education in particular is of vital importance for the nation as it is a power tool to build a knowledge based society of twenty first century improvement of access along with equity & excellence, the adoption of society ,specific, strategic ,enhance the relevance of higher education through curriculum reforms,vacatinalisation,information technology quality in research networking & distance education are some of the main policy initiatives of the higher education sector.

**Higher Education: Concept & meaning-**Higher Education is ambiguous in nature because it use in variety of way by different people, diffarant Country & in different point of time. Impact there is no straight forward definition of higher education.

**History of higher education in India-**Indian Higher Education in its present form begun to appear from the time when British parliament renewed the Charter Act (1813) for educational development in India. College to disseminate English education was established in 1818 at Serampore, Calcutta. McCauley's minute (1835) to promote English education, Charls Woods' Dispatch (1854) to establish the universities of Calcutta, Bombay, and Madras in 1857 and the introduction of grants-in-aid for these universities were the major events. Indian Education Commission or Hunter Commission's (1882-83) recommendation to finance University Education in India provided a major impetus to higher Research Journal of Educational Sciences January (2016) Res. J. Educational Sci. International Science Congress Association 11 educational development in India. Calcutta University Commission (1917) called as Saddler Commission also recommended for autonomy of universities. The Hartog Committee (1929) report suggested for improvement of quality and standards at the University level education In India. The Abbot-Wood Report (1937) recommendation suggested that English should be the medium of Instruction and encourages the establishment of Polytechnics Colleges, Central Technical Board and Vocational Teacher Training Colleges. Finally Sargent Report (1944) recommendation for the establishment of U.G.C and formulation of blue print for Indian Higher Education structure was the major landmark. At the time of independence there were almost 20 universities and 500 affiliated colleges with the students of near about 0.1million in India. After independence India made various efforts to improve higher education system. The first education commission in independent India, Radhakrishnan Commission (1948-49) also recommended for the establishment of UGC. Secondary Education Commission (1952) pioneered a system of 3 year secondary and 4 year higher education. Indian Education Commission (1964) recommended for the introduction of 3 year Degree course and 4 year Honours Degree course. The National Policy on Education (1968) demanded for qualitative improvement at higher education level. The National Policy on Education (1986) recommended 10+2+3

pattern of educational system. The effects of the recommendation of such commissions can be observed from the present status of higher education in India.

#### Trends of Higher Education-

**Table No-1 Trends of Students Enrollment in India**

Year	Total enrollment	Increase over the preceding year	Percentage	GER
2010-11	1,86,70,050	14,26,698,	8.3	-
2011-12	2,03,27,478	16,57,428	8.9	20.80
2012-13	2,23,02,938	19,75,460	9.7	21.50
2013-14	2,37,64,960	14,62,022	6.6	23.00
2014-15	2,65,85,437	28,20,477	11.9	23.60

- Source -UGC Annual Report 2014-15

Above table shows the student enrollment in higher education it was found that student enrollment in higher education has increase from 8.3 % in 2010-11 to 11.9 % in 2014-15 before sleeping into the 6.6 % in 2013-14.it indicates that the enrollment of students in higher education is showing increasing trend .

**Table No-2 Level wise student's enrollment**

Level	Total	Percentage
Under graduate	2,29,33,295	86.26
Post –Graduate	29,46,670	11.09
Research	1,78,781	0.67
Diploma /Certificate	4,16,979	1.57
Integrated	1,09,712	0.41
Grand Total	2,65,85,437	100

Source -UGC Annual Report 2014-15

Above table shows that under graduate students level constitute provisionally 86.26% of the total no of students in colleges & Universities put together .the Percentage of students enrolled for masters level course (PG) had been 11.09 % while very small proportion 0.67% of total no of students have enrolled for research similarly only 1.57% of the total no of students have enrolled in diploma /Certificate course.

**Table No-3 Faculty wise student's enrolment in 2014-15**

Faculty	Total enrollment	Percentage
Art's	99,45,700	37.41
Science	46,75,043	17.59

Commerce / Management	43,57,108	16.39
Education	12,15,442	4.57
Engineering/technology	43,26,316	16.27
Medicine	10,69,911	4.02
Agriculture	2,07,756	0.78
Veterinary science	28,017	0.11
Law	4,44,613	1.67
Other	3,15,531	1.19
Total	2,65,85,437	100

Source -UGC Annual Report 2014-15

Above table shows that the distribution of students across various various faculties during the academic year 2014-15 was as under out of the total enrollment of students (265.15 lakhs),37.41% students had been in the faculty of Art's follow by 17.59% in science &16.39% in commerce / Management. the 71% of total enrollment had been in the three traditional faculties. While the remaining 29% had been enrolled for the professional faculty. The highest percentage being engineering/technology (16.2%) follow by educational teacher training (4.57%) & medical courses (4.02%) etc.

**Table No-4 Gross enrollment ration of different social categories**

Year	All other categories	SC	ST
2010-11	19.40	13.50	11.20
2011-12	20.80	14.90	11.00
2012-13	21.50	16.00	11.10
2013-14	23.00	17.10	11.30
2014-15	24.3	19.10	13.70

Source -UGC Annual Report 2014-15

The above table shows that the GER foe SC & ST students which were 13.50% & 11.20% increase respectively to 19.10% & 13.70 In 2014-15 the overall GER for other category students which were 19.40% In 2010-11 increase to 24.3% in 2014-15

**Table No-5 Public expenditure on education & Gross domestic product**

Year	GDP at current price ( In Crore)	Total expenditure & other Dept.	Expenditure on education & other Dept As % of GDP
1951-52	10,080	64.46	0.64

1960-61	16,220	239.56	1.48
1970-71	42,222	892.36	2.11
1980-81	1,30,178	3884.2	2.98
1990-91	5,10,964	19615.85	3.84
2000-01	19,25017	82,486.48	4.28
2005-06	33,99,503	1.13,228.71	3.34
2010-11	83,91961	2,93478.23	4.05
2012-13	93,88,876	4,03,236.51	4.29

Source- Budget Expenditure

The above table shows increasing trend since 1951-52 to 2012-13 for the public expenditure on education & gross domestic product.

#### **Recent trend in Indian higher Education\_**

- **Privatization** – Privatization within government higher education institutions takes place in the form of introducing self-financing courses within government institutions. Converting government aided private institution in to private self financing institution. Allowing self financing private institution with recognition and also without recognition. This may be termed as commercial private higher education institutions. Private players are mainly engaged themselves in setting up of state private universities, deemed university and academic institution with foreign collaboration.

- **Need to privatize higher education:**

- To increase competitive efficiency of public sector.
  - To meet the growing demand of higher education with rapid growth in population.
  - To reduce financial burden on government and for decentralization of educational institutions.
  - For imparting quality education and training and shaping of the curriculum according to global, national and local needs.
  - To fulfill the need for skilled manpower and to fulfill the need of the country in liberalization, privatization, and globalization.
  - To facilitate technological developments and information based economic development In India, the thrust on privatization in higher education started in the early 90s under the LPG (Liberalization, privatization and globalization) policy.
  - The last two decades has witnessed an exponential growth in Indian higher education system. But there remain lots of challenges to privatization. Privatization of higher education has badly affected the poor, undermined equity, diversity and openness
- **Globalization:** As a result there has been considerable development in the social, economical and educational fields at international and global level. This is termed as internationalization and globalization. The development in education has resulted in the following events.
    - Increased practice of international comparison of educational development.
    - Mobility of students from one country to another.
    - Mobility of scholars from one country to another.
    - Setting up of educational institution from one country to another.

- e) Marketing of education worldwide.
- f) Development of framework for globalization of education through GATT (general agreement on tariff and trade), GATS (general agreement on trade in services) under WTO.

**Conclusion-** Though India has a long heritage of quality higher education system it has failed to solve the problems of Access, Equity, and Quality until recent past. The deteriorating administration, unproductive practice, corruption and fund availability leads to break down of indigenous educational system. Recently with the introduction LPG i.e. liberalization, privatization and globalization an avenue to revive the system has evolved. On the one hand globalization may help to improve the quality of education it can also affect the indigenous development of educational sector. A domestic regulatory mechanism should be put into place to avoid negative impact of globalization.

**GOODS AND SERVICES TAX (GST) :- STRUCTURE AND IMPACT.****Prof. Nitin G. Waman***M.A. M.Phil. SET Nashik Shikshan Prasark Mandal Arts & Comm. College Igatpuri.*

**INTRODUCTION:** Goods and services Tax (GST) is a proposed system of indirect taxation in India merging most of the existing taxes into single system of taxation. It was introduced by the constitution Act 2016. The Chairman of BST bill is union finance minister which is currently arun Jaitley. 1<sup>st</sup> July 2017 and was applicable throughout India which replaced cascading taxes levied by central & state governments.

GST would be a comprehensive indirect tax on manufacturer, sale and consumption of goods and services throughout India, to replace taxes levied by the central and state governments. Good and Services Tax would be levied and collected at each stage of sale or purchase of goods or services based on the input tax credit method. This method allows GST registered businesses to Claim tax credit to the value of GST they paid on purchase of goods or services as part of their normal commercial activity. Taxable goods and services are not distinguished from one another and are taxed at single rate in a supply chain till the goods or services reach the consumer. Administrative responsibility would generally rest with a single authority to levy tax on goods and services. The introduction of goods and services (GST) would be a significant step of in the reform of indirect taxation in India.

**METHODOLOGY:-** The study is completely based on secondary sources. The study of the proposed GST is the result of journals, magazines, book and internet sources.

**CONCEPT:** GST is a indirect tax which will subsume almost all the Indirect taxes of central government and states governments in to a unified tax. As the name suggests it will be levied on both good and services at all the stages of value addition. It has dual model including central good and services tax (CGST) and states goods and services tax (SGST). CGST will subsume central indirect taxes like central excise duty, central sale tax, services tax, special additional duty on customs, counter veiling duties whereas indirect taxes of state governments like state VAT, purchase tax, luxury tax, octroi, tax on lottery and gambling will be replaced by SGST. Integrated goods services tax (IGST) also called interstate good & services tax is also a component of GST. It is not an additional tax but it is system to examine the interstate transactions of goods & services and to further assure that the tax should be received by the important state as GST is a destination based tax.

**STRUCTURE OF THE GST**

- 1) Dual GST:- Both centre and states will simultaneously levy GST across the value chain. Centre will levy as well as collect Central Goods And Services Tax (CGST) and states would levy and collect state Goods and Services Tax (SGST) on all transactions within a state. The input tax credit of CGST will be available for paying the CGST liability on the output at each stage. Similarly the credit of SGST paid on inputs would be allowed for paying the SGST on output.
- 2) Inter State transaction and the IGST mechanism:- The Integrated Goods and Services Tax (IGST) have been designed to ensure seamless flow of input tax credit from one state to another. The centre will levy and collect the IGST on all inter-State supply of goods and services.
- 3) Destination-based consumption tax:- GST will be a destination based tax. This implies that all SGST collected will ordinarily accrue to the state where the consumer of the goods or services sold resides.
- 4) Central Taxes :- Service tax, central excise duty, Additional excise duty, Special additional duty of custom (SAD)

- 5) State taxes:- VAT/ Sale tax, Entertainment tax, Octroi and entry tax, Luxury tax, Taxes on lottery, betting & gambling,
- 6) All goods and services, except alcoholic liquor for human consumption, crude oil, petrol diesel, natural gas & turbine fuel do not come in the Goods & services tax (GST).
- 7) GST Slabs In India

Sir	Product	GST Rate
1	Milk, eggs, curd, unpacked paneer, natural honey, fresh vegetables, fruits. Printed book, Judicial Document etc.	Nil
2	Sugar, tea, coffee, edible oil, coal, newsprint, PDS Kerosene, LPG Etc.	5%
3	Mob phone, almonds, ayurvedic medicines, tooth powder, fruit juices, agarbatti, cashew Etc.	12%
4	Hair oil, soap, toothpaste, capital goods, corn flakes, camera, toilet paper, facial tissues, iron & steel, speaker, envelopes. Etc.	18%
5	Consumer durables, cars, cement, chewing gum, custard powder, pan masala, washing machine, vacuum cleaner, motorcycles.etc.	28%

#### IMPACT OF GOODS AND SERVICES TAX

- 1) **Rail Sector:-** There have been suggestions for including the rail sector under the GST umbrella to bring about significant tax gains and widen the tax net so as to keep overall GST rate low. This will have the added benefit of ensuring that all inter- state transportation of goods can be tracked through the proposed information technology (IT) network.
- 2) **Telecommunication Sector:-** The GST Regime appears to be unfavourable for the telecommunication sector as well as. The dual framework of GST regime could be the direct spike in the services tax rate from 14% to 18%. The proposed GST appears to be silent on whether the telecommunication can be considered under the category of goods and services. Being a regressive taxation system, the burn of increased tax rates will directly be faced by the end consumer unless the credit is passed on to the next in business chain.
- 3) **Education Sector:-** The education sector currently enjoys various tax exemptions and benefits services provided by school & colleges are either not taxed or are covered in the negative list the situation is likely to continue even after the implementation of GST in case it does the sector may be able to avail of input credit or CENVAT credit on the duty paid on purchase of inputs and services.
- 4) **Agriculture Sector:-** The GST on agriculture sector will have a positive impact as all the taxes will be subsumed under a single rate of tax. So movement of agriculture commodities between states will be easier and hassle free which will save time & remove wastages for the transportation of perishables items.
- 5) **Transportation Industry:-** GST on transport sector will result in more efficient cross state transportation. It will bring down the logistics cost, reduced times for transportation. Currently all the 29 state of India collect taxes at different rates on good that move across the state borders that's

why the tax on transportation is collected multiple time. This will make long delays at different interstate checkpoints for reviewing by state authorities who checks for the application of relevant taxes and other levies. This causes the delays for an average of 6 to 7 hours. GST would replace around 15 state & federal taxes and tariffs for a single tax at the point of sale of goods.

- 6) **Real Estate Industry:-** The implementation of GST on real estate sector will effect partially. As the sale or transfer of immovable properties are not included in GST. However the procurement of materials of construction is falling under GST. The classification of goods and services is very important under this sector because it is very necessary to classify the things which will cover under GST and which are not. The Implementation of GST will affect same as in services sector.
- 7) **Health Care Sector:-** one of the major. Concerns of this industry is the current inverted duty structure that adversely, cost of input's being higher than output. This discourages investment in this industry. GST may either remove the inverted duty structure or allow refund of accumulated credit this would be a boon for this industry and can act as its growth catalyst. This current cascading tax structure on import duty makes it expensive for the industry to import machinery. GST is likely to reduce this cost. Further, GST is expected to have a positive effect on the pharmaceutical sector. It will help the industry be simplifying the tax structure, since eight different taxes are levied in the pharmaceutical industry at the moment. A consolidation of all these in to one tax would ease doing business, as well as mitigate the cascading effects of multiple taxes applied on one product.

**CONCLUSION:** Thus the introduction of Goods and Services Tax or The Constitution (one Hundred and Twenty-Second Amendment) Bill2014 is a significant move taken the Indian Government to reform taxation in India.It will help in creating a single national market by merging several central and state taxes under a one single tax procedure. No doubt, the implementation of GST will take time, but it is likely to create more employment opportunities and economic inclusion.

**PRESENT SCENARIO OF PRIMARY CO -OPERATIVE HOUSING SOCIETIES IN MAHARASHTRA****Mr. Nirmal Vijay D.***Assistant Professor, Padmshri vikhe patil College, Pravaranagar, Loni KD, Tal –Rahata, Dist- Amhednagar,***Abstract**

The study find out the present situation of co-operative housing societies in Maharashtra state, such as statistical development of co-operative housing societies, membership development, share capital growth, owned fund growth, working capital growth and problem faced of loans over dues during 2001 to 2015. However the situation to a great extent excluding over dues position. It also studies the benefits of co-operative housing societies. For the loans over dues position some suggestion have given such as, "Proper use of Credit and Prompt Repayment of Loan.", Society has to sanction housing loan only to credit-worthy applicants, Stringent supervision and timely legal actions may be taken against willful defaulters as a warning to other borrowers, at any rate no concessions should be made to the defaulters.

**Keywords:** Co-operative housing societies, Growth, Benefit, over dues.

**Introduction:-** Out of the three basic needs of human being one is a residence. The process of urbanization has been fast due to inevitable migration for bread and butter. Due to increasing civilization in the urban areas the need of the houses to reside is also increased rapidly. In the concept of the modern homes the expectation is not limited for residence only. The expectations like luxurious, full of amenities and delightful residence are included in it. In the concept of the residence, if seems that in addition to more and more facilities the exception like delightful, healthful, civilized, independent surroundings and still the feeling like togetherness has been included in it. It can be easily noticed from the advertisement of Housing Project. Due to fast urbanization process, need of the houses increased and it has become difficult day by day to make the idea in reality of constructing houses with own expenses by coming together and purchasing land. Therefore it came to experience that instead of coming into reality the main purpose of the co-operative housing societies to make available facilities of residence by constructing houses for the members, the only purpose remained in reality is of providing basic amenities, management etc. Especially in the metropolitan city it came to experience at every step that by constructing housing projects by the construction professional and to sale the flat to many persons who are unknown to each other and thereafter registering the housing societies by coming together such unknown persons compulsorily. Housing cooperative has been defined as: "A legally incorporated group of persons, generally of limited means, pursuing the same cause of meeting the common need of housing or its improvement based on mutual assistance. In such a cooperative, the membership is voluntary and control is democratic, and members make an approximately equal contribution to the capital required".

**Objectives of the study:-** 1. To study benefits of Housing Cooperatives.

2. To study present situation of co operative housing societies in Maharashtra state.

3. To suggestion the improvement of Loan overdue of co operative housing societies.

**Research Methodology:** Being an explanatory research it is based on secondary data of journals, articles, newspapers and magazines. Considering the objectives of study descriptive type research design is adopted to have more accuracy and analysis of research study. The accessible secondary data is intensively used for research study.

**Benefits of Housing Co-operatives:-**

1. A housing cooperative is neither a public nor a profit seeking organization. Its principal objective is to eliminate economic exploitation as it is controlled by members only.
2. Contrary to public housing, cooperative housing provides opportunities to its members to control the house designs at the planning stages. Moreover, the maintenance of the estate is also in the hands of members, which leads to maintenance at lesser expenses and in a better way.
3. Cooperative housing satisfies quantitative as well as qualitative aspects of housing. As it incorporates a high degree of participatory involvement of members, the housing stock created is more responsive to user's needs than those supplied through any other sub-system.
4. Housing cooperatives, besides, generating a sense of responsibility amongst users for post-occupancy maintenance, also provide the necessary mechanism for affecting it.
5. Project cost efficiency is demonstrated on account of the concerted efforts of members to keep overheads to a minimum and to effect economy in construction by other means as well.
6. Loans are arranged by the cooperatives for their members and the members have a collective responsibility for its repayment. So, a proper check on the repayment of loans and other charges is maintained.
7. The members have got the right to vote and participate in the affairs of the cooperative, and as such they develop a sense of self-reliance and self-respect.
8. A cooperative is a small community by itself and hence can undertake several social activities such as organizing special programmes, arranging health services, improving the ecology of its area, improvement in social behavior and mental health, etc.
9. Other economic activities such as consumer cooperatives, banks, clubs and other common services which are needed by the community can be established by a housing cooperative in an economical manner.

**Present situation of co operative housing societies in Maharashtra state:-**

The following table shows the present situation of co operative housing societies in Maharashtra state.

**Table No. 1 Growth of Primary co operative housing societies in Maharashtra  
(Rs. In Lakhs)**

Item	2001	2011	2014	2015	Growth rate in %
Societies	52330	79897	94373	102265	195.42
Membership(00)	18566	22249	22700	28360	152.75
Share Capital	13372	14166	17013	13643	102.02
Owned fund	18595	22427	15404	24279	130.56
Working Capital	494807	299469	442071	508912	102.85
Loans Overdue	11773	17297	15761	16626	141.22

(Source- Co- operative movement at a Glance in Maharashtra-2015, Pune.)

From the above table total number of co-operative housing societies in Maharashtra increased by 95.42 % in 2001 to 2015, Membership increased by 52.75% and Share Capital increase rate is very negligible that is 2.02 %. In 2001 to 2015 co-operative housing societies owned fund growth rate is 30.56%, Working Capital growth rate are very few that is 2.85% and Loans overdue increased by 41.22%.

**Conclusion:-**The Central and State governments have to extend appropriate support for improving the financial viability and resource mobilization of the societies. The State Government should contribute towards the share capital and also guarantee the repayment of loans taken by Housing Co-operatives from various financial institutions, to enhance their working capital. The basic problem of co-operatives is the mounting over dues. It affects their smooth functioning.

The following steps may be taken for elimination of over dues of the societies:

1. Borrowers may be educated in "Proper use of Credit and Prompt Repayment of Loan."
2. Society has to sanction housing loan only to credit-worthy applicants. Local eaders/board members should not be allowed to pressurize the society officials into sanctioning loans to unworthy borrowers.
3. Stringent supervision and timely legal actions may be taken against willful defaulters as a warning to other borrowers, at any rate no concessions should be made to the defaulters.
4. The State Government often orders the waiver of penal interest and interest on housing loans. Such waivers create an impression among the defaulters of co-operatives that their loan also need not be repaid. The State Government may find other ways to offer relief to the poor loanees, without interfering with the process of loan recovery.

**E-governance: emerging need in co-operative sector****Dr. Borde G.D***Assistant Professor, Department of Commerce, P.V.P.College, Pravaranagar***Abstract**

*E-governance refers to the delivery of government information and services via the Information and communications technology (ICT) to citizens or businesses or governmental agencies. The purpose of this paper is to study the situation and benefits of e-governance in cooperative sector in Maharashtra. The paper focus on Present situation of e-governance in India, Cooperative society can adopt the e-governance system through the various ways; the application of e-governance in cooperative sector is beneficial to provide better delivery of Cooperative services to members, less corruption, increased transparency, greater convenience, Member empowerment through access to information, decrease in time and efforts.*

**Keywords:** *E-governance, co-operative sector e- membership.*

**Introduction:** The Present time of globalization and IT revolution, every thing is interlinked with internet. It is necessary to co-operative sector too get in flow with present scenario. So the co-operative sector also needs to accept e governance system in India. Some of co-operative societies started this system but most of the institutions have to adopt this system and need to provide smooth services to customer as well as self improvement

**Objectives of the study**

1. To study about e-governance.
2. To study about various e-governance services in cooperative sector.
3. To study the benefits of e-governance in co-operative sector.

**Research Methodology:** Being an explanatory research it is based on secondary data of journals, articles, newspapers and magazines. Considering the objectives of study descriptive type research design is adopted to have more accuracy and analysis of research study. The accessible secondary data is intensively used for research study.

**E-governance:- meaning and definition.:** “e-governance or electronic governance is application of information and communication technology(ICT) for delivering Government services, exchange of information, communication transactions system between Government to citizens, Government to Business, Government to government and Government to employee”.

**Present situation of e-governance in India:** The Government approved the National e-Governance Plan (NeGP), comprising of 27 Mission Mode Projects and 8 components, on May 18, 2006. In the year 2011, 4 projects - Health, Education, PDS and Posts were introduced to make the list of 27 MMPs to 31 Mission Mode Projects (MMPs). The Government has accorded approval to the vision, approach, strategy, key components, implementation methodology, and management structure for NeGP. However, the approval of NeGP does not constitute financial approval(s) for all the Mission Mode Projects (MMPs) and components under it. The existing or ongoing projects in the MMP category, being implemented by various Central Ministries, States, and State Departments would be suitably augmented and enhanced to align with the objectives of NeGP. In order to promote e-Governance in a holistic manner, various policy initiatives and projects have been undertaken to develop core and support infrastructure. The major core infrastructure components are State Data Centers (SDCs), State Wide Area Networks (S.W.A.N), Common Services Centers (CSCs) and middleware gateways i.e. National e-Governance Service Delivery Gateway (NSDG), State e-Governance Service Delivery Gateway (SSDG), and Mobile e-Governance Service Delivery Gateway (MSDG). The important

support components include Core policies and guidelines on Security, HR, Citizen Engagement, Social Media as well as Standards related to Metadata, Interoperability, Enterprise Architecture, Information Security etc. New initiatives include a framework for authentication, viz. e-Pramaan and G-I cloud, an initiative which will ensure benefits of cloud computing for e-Governance projects. SWANs have been made operational in 34 States namely Andhra Pradesh, Chandigarh, Chhattisgarh, Delhi, Gujarat, Goa, Haryana, Himachal Pradesh, Jharkhand, Kerala, Karnataka, Lakshadweep, Maharashtra, Orissa, Punjab, Pondicherry, Sikkim, Tamil Nadu, Tripura, Uttar Pradesh, West Bengal, Assam, Bihar, Madhya Pradesh, Uttarakhand, Manipur, Arunachal Pradesh, Mizoram, Nagaland, Meghalaya Rajasthan Dadar & Nagar Haveli and Daman & Diu. The States/UTs are utilizing the core infrastructure of SWAN for providing the closed user connectivity to various Government offices in the State/UTs. These offices access their applications through SWAN in secured environment hosted at State Data Centers (SDCs). Implementation of SWAN in remaining 2 States/UTs, Andaman & Nicobar Islands has issued LOI for the selection of Network operator and Jammu & Kashmir is in the process of finalization of bid process.

**Cooperative society can adopt the e-governance system through the following way**

Now e-sanchalak portal is available for co-operative societies, near about 3040 co-operative societies, 50340 members and 46 panel auditors are used this portal

This portal provides the following services to co-operative societies

**Administration Compliance:** It provide the services for manage and maintain society registers under co-operative act

- |                |                         |
|----------------|-------------------------|
| 1. I registers | 2. Nominee registers    |
| 3. J registers | 4. Share registers etc. |

**Financial Compliance :** It provide the services for manage and maintain society's all books of accounts under co-operative act

- |                     |                         |
|---------------------|-------------------------|
| 1. Cash registers   | 2. Investment registers |
| 3. Bank registers   | 4. Loan registers       |
| 5. Digital Receipts | 6. Balance sheet etc.   |

**E- Communication:** Society can communicate to its member, Registrar and government with the help of

1. E-mail, 2.SMS, 3. Digital notice board etc.

**E-Membership:** It provides the member services such as

- |                     |                    |
|---------------------|--------------------|
| 1. Member directory | 3. Member Account  |
| 2. Online payment   | 4. E-communication |

**E-Accounts:** It provides the services such as

- |                                |                           |
|--------------------------------|---------------------------|
| 1. Online society account      | 2. Bank reconciliation    |
| 3. Online payment verification | 4. Tax compliance support |

5. Audit compliance support

**The benefits of e-governance in the sector of co-operative sector:**

1. Speed of Transaction
2. Cost reduction
3. Transparency
4. Accountability
5. Improve efficiency
6. Improve services
7. Help build trust between government and member.

**The barriers can be identifying while using online services they are as follows:**

1. Privacy
2. Lack of Infrastructure facilities
3. Illiteracy of Member
4. Power supply in rural area
5. No internet connectivity
6. No awareness etc.

**Conclusions:** the study related to e-governance in respect of co-operative sector. Infrastructure and technologies on the implementation of Electronic governance in India is useful co-operative sector. E-services provides better delivery of Cooperative services to members, less corruption, increased transparency, greater convenience, Member empowerment through access to information, decrease in time and effort. Though a lot of improvements in new technologies, but cybercrime overcome the benefit of digital governance.

**IMPORTANCE AND ADVANTAGES OF E-BANKING****Prof. Dr. Archana A. Vikhe***Vice Principal, and Asst. Prof., Dept of Commerce, Arts, Science and Commerce College, Kolhar.***Abstract**

*E-banking offers ease of access, secure transactions and 24-hour banking options. From small start-up companies to more established entities, small businesses rely on e-banking to eliminate runs to the bank and to make financial decisions with updated information. E-bank is the electronic bank that provides the financial service for the individual client by means of internet.*

**Introduction** : Common type of electronic banking transaction is a debit card purchase, in which the user swipes his card through a processing machine to make a payment or withdraw money from an automated teller machine (ATM) electronically. E-banking refers to the banking services provided by the banks over internet. Customer also use e-banking on their mobile phones using a Wi-Fi or 3G, 4G connection. Online banking is also known as internet banking, e-banking or virtual banking. E- Banking is an electronic payment system that enables customers of a bank or other financial institution to conduct a range of financial transactions through the financial institution's website.

**Objectives of Research**

1. To study the key features of e-banking
2. To study the importance of e-banking
3. To study the advantages of e-banking

**Research Methodology:** The primary source of the information in this research study is the secondary data. The available information on internet regarding the e-banking has been extensively used the complete the paper. All the available Journals, Articles, papers provided necessary information to finalize the research study.

**All the key features of Internet banking for customers:**

- Mobile banking service
- Balance and transaction history
- SMS banking service
- E-Statements and Statement Preferences
- Order new statements
- Mobile banking
- Pay bills with BPAY (Electronic bill payment)
- Receive bills online with BPAY
- Foreign currency calculator
- Transfer funds
- Open or apply for selected accounts
- International and RTGS payments
- Daily Limits Packages for BPAY, Pay Anyone and Multi Payments

**Importance of E-Banking in Business:** Businesses rely on rapid and efficient access to banking information for cash flow auditing, daily financial transaction processing and reviews. E-banking offers secure transactions, ease of access 24-hour banking options. From small companies, small businesses to more established entities rely on e-banking to eliminate runs to the bank and to make financial decisions with updated information.

**Productivity:** E-banking leads to productivity gains. Automating routine bill payments, minimizing the need to physically visit the bank, the ability to work as needed rather than on banking hours may decrease the time involved in performing routine banking activities. Additionally, online search tools, other programs and banking actions can allow staff members to research transactions. Resolve on their own banking problems, without interacting with bank employees.

**Activity Review:** Accounting staff, Business owners and other approved employees can access routine banking activity such as, cleared checks, money deposits and wired funds quickly through an online banking interface. This ease of review helps ensure the smooth processing of all banking transactions on a daily basis.

**E-Banking reduced Errors:** E-banking reduces banking errors. Automation of payments, wires or other consistent financial activities ensures payments are made on time. Electronic banking eliminates errors due to poor handwriting or mistaken data and information. In many cases, daily reviews and electronic files of banking data can be used to double check vital accounting data and information; it increases the accuracy of financial statements.

**E-Banking reduced Fraud:** E-banking provides an electronic footprint for all accounting business owners, managers and personnel who modify banking activities. E-banking offers visibility into banking activities.

**Lower Banking Costs:** Banking costs and relationships are often based on resource requirements. More demands on banking employees and need more physical assistance with research requests, deposits, wire transfers and other banking activities often incurs higher banking fees.

**Advantages of E-banking:** You can pay your bills online and access a record of your checking account transactions online. Online banking is an important feature. Most banks offer this features. Online banking makes everything you do with your finances. You can access the information anywhere that you have access to the Internet. It makes your financial life much easier to manage.

- For business transactions bank offer e-banking facilities. E-banking services are available 24 hours a day and 365 days around the year. Where internet is unavailable services are provided by telephones, mobile phone.
- You can use online banking to pay your bills. This will eliminate the need for stamps and protect yourself from the check being lost in the mail.
- At the touch of a button, actual time account balances and information are availed. This hastens banking processes hence increasing their efficiency and effectiveness.
- It also acts as a great medium for the banks to endorse their products and services. The services include loans, investment option and many others.
- Online banking allows you to access your account history and transactions from anywhere. This is the quickest way to check and see if a transaction has cleared your account.
- It is fast and efficient. Funds get transferred from one account to the other very fast. You can also manage several accounts easily through e-banking.
- It is available all the time; you can perform your task from anywhere and at any time, even in night when the bank is closed or on holidays. The only thing you need to have is an active internet connection.
- E-banking allows for easier updating and maintaining of direct accounts. The time for changing mailing address is greatly reduced, ordering of additional checks is availed and provision of actual time internet rates.
- Lack of substantial support and overheads costs result to direct bank offering higher interest rates on saving and charge lower rates on mortgages and loans.

- E-banking allows automatic funding of accounts from long established bank account via electronic fund transfer.
- A consumer can be monitoring his/her spending via a virtual wallet through certain banks and applications and enable payments.
- Online account is simple to open and easy to operate.
- The speed of transaction is the faster relative to use of ATM's or customary banking. Internet banking has several over traditional one which makes operating an account simple and convenient.
- It is quite convenient as you can easily pay your bills, can transfer funds between accounts. Now you do not have to stand in a queue to pay off your bills.

**Conclusion :** The arrival of technology and the escalating use of smart phone and mobile devices, has given the banking industry a new platform. Connecting a customer anytime and anywhere to their money and needs online banking are almost impossible to do conveniently with regular banking. In short banking business going through tremendous changes in its business and try to acquire advanced technology in business. This business became a service and customer oriented day by day, for that purpose banking business involved in various features, activities efficiently not in only India, but also on foreign country.

**FDI INFLOW IN INDIA****Dr. Archana Satish Jadhav***Asst. Prof., Dept. of Economics, Indrayani Mahavidyalaya, Talegaon Dabhade, Tal: Maval, Dist: Pune***Abstract**

The present paper has focused on FDI and its impact on various sectors in Indian economy. Foreign direct investment (FDI) plays an important role in India. It not only brings in capital and technical know how but also increases the competitiveness of the domestic economy. FDI is the largest source of external finance for developing countries. Overall it supplements domestic's investment, much required for sustaining the high growth rate of the country. Since 2000, significant changes have been made in the FDI policy by the government. During 2014-15, total FDI inflows were US\$41.22 billion, while FDI equity inflows were US \$ 28.81 billion. Services construction, telecommunication, computer hardware and software, automobile industry, chemicals and power have attracted a proportionately high share of total inflows. The main purpose of the study is to examine the impact of FDI on various sectors. Also researcher intend to highlight the Importance and barriers to FDI, view on various points as like as, FDI in retail, FDI in defense, FDI in education and some suggestions for increasing inflow of FDI.

**Key Words:** FDI, Defense sector, education sector, retail sector, economy, foreign investment

**Introduction:** Foreign investment was introduced in 1991 under Foreign Exchange Management Act (FEMA), driven by then finance minister Manmohan Singh. Which subsequently generated more than one crore jobs. FDI in India is the major monetary source for economic development in India. Foreign companies invest directly in fast growing private Indian businesses to take benefits of cheaper wages and changing business environment of India. In 2015, India emerged as top FDI destination surpassing China and the US. India attracted FDI of \$31 billion compared to \$28 billion and \$27 billion of China and the US respectively. India received \$63 billion in FDI in 2015. India also allowed 100% FDI in many sectors on 2016.

**Definition of FDI:** "FDI is defined as the net inflows of investment to acquire a lasting management interest in an enterprises operating in an economy other than that of the investor".

**Significance:** India is developing country whose retail industry is largest industry and all sectors huge part of our developing economy .So, this policy can solve the problem of capital, employment and raw material also will get the opportunities to develop the economy by foreign retailer.

**Objective of Study:** This study will try to explore the following objectives:

- To understand the concept of FDI.
- To evaluate the impact of FDI on other sector in Indian economy.
- To study of important and barriers to FDI.
- To give suggestions for developing sector in India.

**Research Methodology:** The present study is like descriptive type. This research paper is mainly based on secondary data sources. The information has to be collected from different books, journals, reference books, published data of RBI report, Magazines, Souvenir and Websites is used for the analysis.

**Importance and Barriers to FDI:**The rapid growth of world population since 1950 has occurred mostly in developing countries. This growth has been matched by more rapid increases in gross domestic product and thus income per capita has increased in most countries around the world since 1950. An increase in FDI may be associated with improved economic growth due to the influx of capital and increased tax revenues for the host country. Host countries often try to channel FDI investment into new infrastructure and other projects to boost development. Greater competition from new companies can lead to productivity gains and greater efficiency in the host country and it has been suggested that the application of a foreign entity's policies to a domestic subsidiary may improve corporate governance standards. Furthermore, foreign investment can result in the transfer of soft skills through training and

job creation, the availability of more advanced technology for the domestic market and access to research and development resources. The local population may benefit from the employment opportunities created by new businesses. In many instances, the investing company is simply transferring its older production capacity and machines, which might still be appealing to the host country because of technological lags or under-development, in order to avoid competition against its own products by the host country/company.

**FDI in Indian Education Sector:** The Government of India has allowed for 100% Foreign Direct Investment (FDI) in the education sector under the automatic route. Recently, GOI also allowed for 100% FDI in the Construction Development projects which would also include educational institutions. These investments are also carried through the automatic route. However, allowing despite 100% FDI in the education sector, there has hardly been any investment in this sector and the response from foreign investors has been very lukewarm, to say the least. The primary issue behind the lack of investment is the fact that the investment has to be done through a not-for-profit entity. The not for profit character would inevitably require the Indian entity to be either registered as a Society or a Trust (in case of schools, colleges and private/deemed universities) or a Section 8 Company (mostly in case of schools) under the Companies Act, 2013. This not for profit requirement has become a major bottleneck for attracting investments.

**FDI in Retail Sector:** Foreign direct investment (FDI) in the retail sector in India is restricted. In 2006, the government eased retail policy for the first time, allowing up to 51 per cent FDI through the single brand retail route. Since then, there has been a steady increase in FDI in the retail sector, and the cumulative FDI in single brand retail stood at \$195 million by the middle of 2010 (DIPP, 2010). According to the Department of Industrial Policy and Promotion (DIPP) of the Government of India, single brand retail comprises those retailers selling products of a single brand only, such that products should be sold under the same brand internationally, and single brand product retailing covers only products which are branded during manufacturing. In this category, FDI is allowed to the extent of 51 per cent in contrast, no FDI is allowed in the multibrand retail category. This includes all firms in organized retail that seek to stock and sell multiple brands, such as large international retailers like Wal-Mart and Carrefour. This is the sector that is most under dispute. The retail sector of India is vast and has huge potential for growth and development, as the majority of its constituents are un-organized. The retail sector of India handles about \$250 billion every year and is expected by veteran economists to reach to \$660 billion by the year 2015. The business in the organized retail sector of India is to grow most and faster at the rate of 15-20% every year and can reach the level of \$100 billion by the year 2015. Here, it is noteworthy that the retail sector of India contributes about 15% to the national GDP and employs a massive workforce of it, after the agriculture sector. India's growing economy with a rate of approximately 8% per year makes its retail sector highly fertile and profitable to the foreign investors of all sectors of commerce and economy, of all over the world. Until now, according to the Indian retailing laws, Foreign Direct Investment in multi brand retail market was prohibited. But government is thinking to open the FDI in retail in India which implies that foreign investment in retailing is possible up to 51%. Now the announcement of retail FDI in India has triggered a series of debates on both positive and negative notes and become political issue.

**FDI in Defense Sector :** Foreign Direct Investment (FDI) policy in defense sector was last reviewed on 24<sup>th</sup> June, 2016. As per the extant FDI policy, foreign investment up to 49% is permitted under the automatic route, foreign investment beyond 49% and up to 100% is permitted through Government approval, wherever it is likely to result in access to modern technology or for other reasons to be recorded. FDI in defense sector is subject to Industrial License under the Industries (Development & Regulation) Act, 1951. From July 2016 to January 2017, FDI to the amount of 0.61 lacs has been received from M/s Elbit Systems Land and C41 Ltd, Israel in M/s BF Elbit Advanced Systems Pvt. Ltd.

**Suggestions & Recommendations:**

1. India should have policies that mobilize FDI in different sectors, by facilitating good returns for the investors.
2. Formulation of a Model central law regarding FDI of Retail sector.
3. In order to improve the technological competitiveness of India, R & D activities should be promoted.
4. Government of India should foster a climate that promotes entrepreneurship.

**Conclusions:** FDI is important for India because it is an important growth driver and create jobs, eradicate poverty through the development of different regions. However, there are many hurdles in the way of FDI inflows. We hope that the recent measures to open up the economy to FDI will make India a preferred destination and bridge the current account deficit.

**DEMONETIZATION AT AFFECTED INDUSTRIALIZATION AND ECONOMICAL SITUATION****Dr.Satish A .Bhosale (Associate Professor)***( HOD Business Practise) Appasaheb Jedhe Atrs commerce and science college,Pune :*

**INTRODUCTION :** On 8 November, 2016, when everyone sat stuck to their televisions eagerly waiting for the announcement of winner of the presidential elections for US, Indian PM Narendra Modi managed to conquer everyone's attention towards him. He announced the demonetization of 2 currency notes in India, aimed at knocking out terrorism, counterfeit money & black money in circulation and curbing corruption. From that day, currency notes of Rs 500 and Rs 1000 were no longer Indian legal tender; instead new currency notes of face value 500 and 2000 were brought into the market. Read what happened in detail here. The announcement of demonetization tore the country into three categories. While some applauded the decision appreciating and calling it a bold decision, others became hardcore protesters, while some chose to remain fence sitters. In this article, we are going to analyze the pros and cons of demonetization after 10 months of it. Expected impact on the targeted evils v/s real outcome

**Corruption:** Corruption in India is not merely an evil of the society, but an accepted part of every person's life in the country. Removing that part with banning and changing currency seems impossible. But the concept of 'cashless economy' has come up an idea of 'corruption and black money free India' and has managed to reduce the instances of corruption to a remarkable extent by bringing transparency in the transactions. As most of the cash in India is exploited to execute illegal and immoral tasks, cashless economy will undermine those tasks. Transparent and detailed transactions will ensure no chances of escaping taxes and easiness in tracking the crimes if required. According to Transparency International's Corruption Index, even though India is still the most corrupt country in Asia, corruption related reports have reduced by 10% since 2015.

**Counterfeiting:** In 2016, it was estimated by the Indian Statistical Institute that fake currency amounting to Rs 400 corer was in circulation in the Indian economy which accounted for 0.22% of the total cash flow in the market. Only Rs 4 lakh corer were captured in fake currency which does not even amount to 15% of the total currency in circulation. Measures such as identifying, investigating and punishing counterfeiters or exchanging old series of banknotes with new ones are taken against counterfeiting in most of the countries. Demonetization is generally avoided as it incurs huge cost and people can play tricks with new currency as well.

**Unaccounted Wealth:** In the book "Understanding the Black Money and Black Money in India" authored by Arun Kumar, JNU professor and an economist has written, "Only a small amount of the black money would be affected by demonetisation... it is unlikely that black marketers and other generators of black money will suffer because the biggest fish were able to quickly convert whatever black cash they had into white." India Ratings and Research has concluded that only 12% of the ill-gotten money could be extracted with the idea of demonetization while 88% of the black money is still in circulation in Indian markets. It is evident that the decision of demonetization has not been able to hit ill-gotten money hoarders, hard instead some of them have used it to legitimize their black money.

**Terrorism, Hawala and Crime:** As per reports by various investigation agencies, most crimes take shapes through fake currency and ill-gotten wealth. People generally require a lot of cash to carry out dark jobs which means that the shortage of currency halted these jobs to a great extent. Reports released in the immediate aftermath of demonetisation estimated that incidents of terrorism have reduced by 60% especially in Jammu and Kashmir; however these were questioned by many in the long run. Hawala

business has also got a big blow and fell by almost 50%. It can be said that demonetization has managed to cripple terrorism but has also given rise to unemployment which is the breeding place of terrorism and crime in India. A team of rescue workers stated that there is a radical fall in the trafficking industry due to demonetization.

**Economic Sector of India:** Scarcity of cash forced many small scale industries to burn down to ashes. Commercial banks found it difficult to bridge the gap between the supply of banned notes from people and the supply of currency notes from RBI. Moreover, the National Statistical Commission revealed that demonetization hampered the growth of the construction industry, which is the second largest employment generating industry in the country. Agriculture, which is considered to be the 'backbone of India', also, could not cope up with the rising prices, contracting demands and money shortage. As a result of falling industrial growth and diminishing opportunities of employment, demand and supply of the Indian markets also faltered. Prices soared and purchasing power dropped in the 'out of cash' country. As a result, the GDP growth of India fell to 5.7% after 4 months of demonetization (March-June 2017). It is the sixth Consecutive quarter which has witnessed declining GDP.

**Comparing Gains and Losses:** In short, demonetization managed to reduce the ill-gotten wealth, corruption, terrorism and fake currency to some extent. Centre for Monitoring Indian Economy (CMIE) estimates that demonetization has cost India around 1.28 lakh crore which has burdened the shoulders of poor, tax payers and people holding legitimate currency. It failed to curb the difference between rich and poor. It has also beaten the economy, creating unemployment and breakdown of the industrial structure of the country. Overall, it seems that the instances and magnitude of loss weigh down the gains.

#### **Demonetization In India:**

##### ***Pre And Post Effect On Indian Industry***

India is a cash based economy, hence the circulation of fake notes is likely to cause harm to the society. Fake notes are used for various inflammatory activities such as spying, smuggling of arms, drugs and other illegal traffic in India. The high denomination notes contribute 86% to the total supply of money in the economy. The value of these notes is more than 13% of GDP in 2016, which is much more than in any other developing country like Brazil and China. As per the reports number of fake notes in the banking system in 2006 was 1.24 lakh and it went to 6.33 lakh in 2016 and also the share of high value notes increased from 10.4% to 64% from 2006 to 2016. To track the same issue of fake currency notes and to invalidate black money, the government of India announced that Rs 500 and Rs1000 notes will be no longer legal tender from midnight, November 8 2016. This is not a new step in the history to demonetise the currency. In 1946 first time the currency of Rs 1000, Rs 5000 and Rs 10,000 was demonetised and phase out these notes. In 1938 RBI printed the highest value notes of Rs 10,000 which was demonetised in 1946. Rs 1000, Rs 5000, Rs 10,000 were in circulation in 1946 which was reintroduced in 1954 and further all these notes were demonetised in January 1978. Rs 1000 note was again introduced in November 2000. Rs 500 were circulated in 1987 as an attempt to control the volume of bank notes due to inflation. Hence Rs 2000 note was introduced for the first time. In 1967 the bank notes with Ashoka pillar watermark were introduced. In October 1987 the notes were imprinted with the portrait of Mahatma Gandhi. The Rs 50, Rs 100 banknotes were issued in August 2005, followed by Rs 500 and Rs 1000 in October 2005, which continued till November 2016. The liquidity crisis and clampdown on black money on account of demonetization headway is expected to impact the sectors that are based on cash transactions to a great extent.

#### **AUTOMOBILE INDUSTRY :**

**Indian automobile :** Industry stands as one of the booming industry in the world with annual production of 23.37 million vehicles in 2014- 15 touching the growth of 8.68% since last year Indian automotive aftermarket stood around US\$ 7 billion by 2021 with the growth rate of 10-15%. The industry was able to allure FDI worth US\$ 15.79 billion during April 2006 – September 2016. (Source: Department of industrial policy & promotion)

**Pre Demonetization:** The industry accounts for 7.1% of country's GDP. The total production of the industry is 23960940 vehicles (including passenger vehicles, commercial vehicles, three wheelers & two wheelers) during April – March 2015 the number stood to 23,358,047, which recorded a growth of 2.58%. As per the graph shown below two wheelers segment with 80% market share is the leader in the domestic market, the reason behind the growth is due to growing middle class and young population in India . The growing interest of companies to hunt the rural market also promoted the growth of the sector. Passenger vehicle segment with 14% market share is follower of two wheeler segment and others are commercial vehicle and three wheeler market shares of 3% each similarly passenger vehicles, commercial vehicles, three- wheeler and two -wheeler showed a growth of 6.89%, 13.77%, 18.69% and 16.60% respectively during 2010 to 2015. Two wheelers made a remarkable share of export at 69.4% in 2015, followed by 16.7% for passenger vehicles and three -wheeler accounted for 11.1% exports in 2015. Luxury cars market is expected to reach 150000 units by 2020. Various steps are being initiated by the Indian government and automobile companies to make India a leader in the market by 2020.

**Post demonetization:** Certain precautionary steps are required to bear the heat of capricious event of demonetization; the downfall is clearly portrayed in the detailed figures below in the table. Till October 2016 the automobile sales were in growing percentage at the rate of 4.5%, but sales started to decline after the announcement was made by Prime Minister Narendra Modi, despite aggressive sales push to thrash the year end indolence. The domestic sales declined by 5.5% and maximum decline was observed in case of three wheelers which dropped by 25.9%. He above table clearly shows the overall decline in sales of all the segments of the industry due to demonetization as compared to previous year 2015. The sales of passenger vehicle went down by 1.4%. Two wheeler volumes declined sharply during December 2016, a second consecutive month of decline. With consecutive 10 months of increased sales December 2016 observed the maximum downfall. The sharpest downfall was seen in scooters Lowering by 26.4% followed by motorcycles that slumped by 22.5% even as mopeds continued to return upbeat volume growth. Domestic sales of commercial vehicle went down by 5.1% during December. The sales of trucks and buses observed positive sales. The export market in the automobile reduced 35% in 2016. In the coming months ICRA expects the growth of 3 wheelers industry around 0-2% in 2017. From low priced two wheelers to the luxury cars the whole line has been affected. Though discomfort is caused but it will be a dominant spring in cashless economy and will bring transparency into the system.

**CONSUMER MARKETS:** Indian consumer segment includes market for the consumer durables and fast moving consumer goods. This sector is composed of huge middle class, relatively large wealthy class And small economically low class, for which it is foreseen to double the spending class by 2025. As per the reports India's share of worldwide consumption is anticipated to increase Twice at the rate of 5.8% by 2020.

**Pre-demonetization:** India scored second position in global consumer confidence index with the score of 128 points toll June 2016, and Philippines scored 132 points. The Indian consumer market showed a positive growth at annual rate of 5.7% from 2005-2015, and it's expected to grow at 6.7% for the year 2015-2020 and 7.1% for the year 2021-2020. Whereas FMCG sector is growing on an average of 11% for last 10 years, and is expected to increase at 14.7% and reach US\$ 110.4 billion from 2012 to 2020.

The rural market share is increasing at the rate of 17.7% and has reached US\$ 100 billion. Food products is leading with the share of 43% of overall market share followed by personal care 22% and fabric care 12%.

#### **Future Of India After Demonetization and effect on Industry product :-**

#### **Demonetisation pulls down India GDP growth rate to 6.1% in Q4 2016-17**

**New Delhi:** India's economic growth slowed for the fourth consecutive quarter in the three months ended March, mirroring the impact of demonetization on key sectors including construction and financial services.

Gross domestic product (GDP) growth slowed to 6.1% in the fiscal fourth quarter from 7% in the third, according to data released by the government on Wednesday. The slowdown may put pressure on the Reserve Bank of India, whose monetary policy committee meets next week, to cut policy rates to balance its inflation-targeting focus with the need to stimulate economic growth.

Year-on-year change in %	FY17			
	Q1	Q2	Q3	Q4
GVA at basic prices	7.6	6.8	6.7	<b>5.6</b>
Private consumption	8.4	7.9	11.0	<b>7.3</b>
Investment demand	7.4	3.0	1.7	<b>-2.1</b>
Agriculture	2.5	4.1	6.9	<b>5.2</b>
Industry	7.4	5.9	6.2	<b>3.1</b>
Services	9.0	7.8	6.9	<b>7.2</b>

GVA: Gross value added Source: Central Statistics Office

Real gross value added (GVA), another measure of economic activity that is arrived at by excluding net indirect taxes from GDP, slowed to a growth pace of 5.6% in the March quarter, also the fourth consecutive quarterly decline. The Central Statistics Office maintained its earlier full-year growth estimate for 2016-17 at 7.1% on top of revised 8% growth in the previous financial year. The growth numbers reflected the lingering effects in the March quarter of the government's demonetization of high-value banknotes with effect from 9 November, which triggered a cash crunch and disrupted business, especially in the unorganized sector. The labour-intensive construction sector contracted as a result of the cash shortage and regulatory changes, and financial services grew at an anaemic single-digit pace. The distinct downtrend in GDP growth over the four quarters of FY17 suggests that the slowdown in growth that had already set in had been intensified by the note ban, said Aditi Nayar, principal economist at rating company ICRA Ltd "Demand and purchases during the festive season and a favourable base effect appear to have couched the impact of the note ban on consumption growth in Q3 FY17, which was followed by a sharp dip in Q4 FY17," she added. Fiscal fourth-quarter growth in the \$2.3 trillion Indian economy, the third largest in Asia, trailed the 6.9% pace at which China grew in January-March, putting it at the risk of losing its status as the world's fastest expanding major economy. India's per capita income in real terms in 2016-17 also slowed to a growth pace of 5.7% to Rs 82,296 (\$1,276) against 6.8% growth last year. Chief economic adviser Arvind Subramanian said the fourth quarter numbers had been expected to reflect the biggest impact of demonetization. "We can see some signs of bottoming out on account of the demonetization, and recovery in the nominal aggregates which picked up in the fourth quarter shows that," he added. The construction sector shrank 3.7% in the March quarter, compared with a 3.4% growth in the preceding quarter. The announcement that a real

estate regulator will be appointed to ensure higher accountability in the sector may have also contributed to the slowdown. Mining picked up to grow 6.4% and so did public expenditure, rising 17%. Agriculture output growth slowed but stayed robust at 5.2% and financial services grew by just 2.2%. The manufacturing sector (5.3%) as well as trade, hotels and transportation (6.5%) also slowed from their levels in the preceding quarter. Excluding agriculture and public expenditure, core GVA grew 3.8% in the fourth quarter, revealing the deeper impact of demonetisation and suggesting that economic activity would have been much slower without a substantial push in public expenditure.

Growth in gross fixed capital formation, which is a proxy for investment demand in the economy, slowed sharply in FY17 to 2.4% from 6.5% a year ago. Private final consumption grew 8.7% in FY17 against 6.1% a year ago. The statistics department also revised GDP data since 2012-13, incorporating the new wholesale price index and index of industrial production series which showed the economy grew marginally faster in 2014-15 and 2015-16 than earlier thought. Credit rating agency Moody's Investors Service on Wednesday projected India's economy to accelerate to grow at 7.5% in 2017-18 and 7.7% in 2018-19 as the government has been able to limit the negative impact of last year's demonetization on the economy.

The World Bank also expects the Indian economy to grow at 7.2% in FY18 and gradually gather pace to touch 7.7% by FY20, a year later than Moody's projection.

## **ADVANTAGES AND DISADVANTAGES OF FDI**

**Archana Ganesh Magar & Dr. Sambhaji Bhaurao Kale**

*Research Student, Pune University*

*Head of Department of Economics, Jijamata College of Science and Arts*

*Bhenda (Bk) Tq.Newasa, Dist. Ahmednagar – 414 605 Maharashtra*

Foreign Direct Investment (FDI): is an investment in a business by an investor from another country for which the foreign investor has control over the company purchased. The organization of Economic Co-operation and development (OECD) defines control as owing 10% or more of the business. In the context of foreign direct investment advantages and disadvantages are often a matter of perspective An FDI may provide some great advantages for the MNS but not for the foreign Country where the investment is made on the other hand, sometimes the deal can work out better for foreign country depending upon how the investment pans out ideally, these should be numerous advantages for both the MNS and the foreign country, which is often a developing country, we'll examine the advantages and disadvantages from both perspectives, starting with the advantages for multinational enterprises (MNE).

### **Advantages of FDI**

- 1] **Access to market** :- FDI can be on effective way for you to enter into a foreign market. Some countries may extremely limit foreign company access to their domestic markets. Acquiring or starting a business in the market is a means for you to gain access.
- 2] **Access to Resources:-** FDI is also an effective way for you to acquire important natural resource such as precious metals and fossil funds, Oil company for example, often make tremendous FDIs to develop oil fields.
- 3] **Technology diffusion and knowledge transfer:-** FDI apparently helps in the outsoars at knowledge from India especially in the information Technology Sector Developing countries by inviting FDI can introduce word-class technology and technical expertise and processes to their existing working process.
- 4] **New Technologies :** FDI can be bring in more new technologies which were not adopted in the country till now exist are recent development in the communication system. The launching at satellites with the help of other countries has enabled the growth of communication system in the country.
- 5] **Increase in capital inflow:** FDI promotes more capital inflow into the country especially in key and core sectors, we have a shortage at capital not only in the form at money but also in the form of material FDI's will bridge this gap by which there will be speedy economic growth in the country.
- 6] **Promotion at Employment opportunities :**The advent of FDI in developing countries has promoted the service sector. This has resettled in a change in the advertising and marketing technologies. This provides more scope for employment opportunities, educated unemployment opportunities; educated unemployment to some extent is reduced by the FDI as they could absorb some at India work force.

### **Disadvantages Of FDI :-**

- 1] **Bad deal for the small entrepreneurs: -** The small business and the cottage industry would face extinction from the market because they would not be in a position to complete with the big

multinational giants with their immense resources and formidable marketing methods. The Indian consumers would be more inclined towards the products manufactured by the big companies.

2] **Trade deficit:** Trade related intellectual property rights and trade related investment measures restrict the production of certain products in other countries. These measures force the countries like India to manufacture certain products a higher cost through FDI.

3] Due to the foreign direct investment in our country, the greatest disadvantage is that inflation would increase due to the foreign influence.

4] The product quality will now not be mattering factor and they would now become the irrelevance for the customer to check the product details.

5] Domestic market players would suffer due to the new entrants in the market which would affect their selling power.

**DISABILITY STUDIES IN INDIA: EMERGING ISSUES AND TRENDS****Dr. Sunil Ugale & Miss Shaikh Nilofar Anwar***Vice – Principal, Head Dept of Economics, V.N.Naik college, Dindori, Dist.Nashik**Research Student, post Graduate Centre in Economics, S.M.B.S.T College,Sangamner*

**Introduction**-According to the census 2011, there are 2.68 crore persons with disabilities in India who constitute 2.21 percent of the population ,out of which ,1.50 crore are male and 1.18 crore and female. They include persons with visual , hearing speech , locomotor ,mental disabilities, multiple disabilities etc. the census data also shows that 69.50 percent of persons with disabilities live in rural areas .Our goal and commitment is to make an inclusive society . the constitution of india guarantees equality to all citizens before law and equal protection of law. It prohibits discrimination on grounds of religion, race,caste,sex place of birth or any of them .

**Disability policy Today** –"disability policy today " describes and analyzes the emerging global commitment to equalizing access for people with disabilities to social and economic opportunities .The human rights argument for equalizing opportunities for people with disabilities was initially, expressed by the United nations in It is 1971 declaration on the rights of Mentally retired person and its 1975 declaration the rights of disabled person. The philosophy was then fully articulated in the world program of Action concerning disabled person (WPA) , adopted by the general assembly in 1982. Most nation now have disability policies which express commitments to equalizing opportunities for disable people .predictably considering their long histories of dealing with disability issues and considering their relative abundance of resources the worlds high income countries ,particularly those in europe and north america ,tend to be characterized by more advanced and better funded institutional approaches to disability than most low and middle income countries.

**Disability trends and issues:** In most industrialized countries where disability strategies have been evolving for many years , national approaches to disability tend to consist of disconnected combinations of modern inclusive approaches and elements of the rehabilitation ,special education and custodial care approaches of the past. Though these disjointed system still tend to reflect their historical roots by focusing too heavily on the rehabilitation and training of people with disabilities in segregated institutional setting ,there is a gradual but definite shift toward more integrated strategies to remove and prevent architectural and design barriers and increase access for people with disabilities to mainstream social services ,particularly education .In developing countries ,disability service system the have historically tended to consist of small scale ,rehabilitation ,education ,training and sheltered employment programs and projects imported from industrialized countries by churches , NGOs and PVOs .such program have never reached significant proportions of their target populations due to their high costs .and their impacts have typically been restricted by the some types of conceptual problems that have long plagued their prototypes in industrialized countries .

**THE SOCIO-ECONOMIC IMPACT OF E-GOVERNANCE: INDIAN SCENARIO****Prof. Appasaheb Digambar Kandekar***Assistant Professor and Head of the Department, Nutan Arts, Commerce and Science College Rajapur***Abstract**

Today Information Communication Technology (ICT) constitutes the fastest growing component of the global economy and the revenue generated by the interactive information industry may have reached \$3.5 trillion. Recently, the Indian Government has set the target of delivering at least 25 percent of its dealings and services electronically. In this regard, the Indian Government's major policy measures have been defined in terms of computer density, connectivity, content, cost and cyber laws. E-Government can advance the agenda on governance and economic reform, transparency, anti-corruption, empowerment and poverty reduction. In conclusion, one needs to understand that after two decades of e-commerce, e-governance and e-citizen, India remains one of the poorest countries in the world with 44.3 percent adult literacy rate, 25 percent people without health services, 71 percent without access to sanitation, 35 percent living below the poverty line, \$100 billion external debt and 128th rank in the recent Human Development Index E-governance must show more than this dismal scenario of human conditions in India. But it is yet to be seen whether e-governance can eradicate poverty, reduce inequality and satisfy basic human needs in a poor country like India.

**Keywords:** Socio- Economic impact. E-governance, Indian Scenario.

**Objectives of the Study-**

- 1) To Study the Social Impact of E-Governance.
- 2) To Study the Economic Impact of E-Governance.

**Research Methodology-**The study has been conducted fully on conceptual basis .The data collection has included the following sources-1) Experts statements on the The Socio-Economic Impact of E-governance.2)Pre-Existing & Existing documents such as Journal Articles, Reports from the associations in the field of E-Governance, News papers, Periodicals etc. 3) Internet websites has mainly used for collecting the information.

**Introduction:** Given the number of cyberspace initiative recently announced by the Central and State Governments of India, it almost seems as if "e-government" will be as important a mantra in India as "e-commerce" in the first few years of the new millennium (MMRao, 2003). By many measures, the problem of poverty is no more severe anywhere else than it is in India, which still has the world's largest number of poor people in a single country. Thirty five percent of its billion plus population lives on less than US\$ 1 per day and around 86 percent of Indians, more than 900 million people, manage to survive on incomes of less than US\$ 2 a day. Although the much-heralded economic reforms of recent years have led to impressive levels of economic prosperity and the creation of a middle class, the distribution of wealth in India continues to be highly uneven. Further-more, despite reductions in India's poverty level during the 1970s and 1980s when farmers prospered, poverty reduction efforts stagnated during the 1990s, along-with declines in agricultural growth, a slowing of growth in agricultural incomes and price rises of basic food staples. The causes of these set-backs, according to the World Bank, lie in the nation's fiscal crisis, which reduced the ability of the Government to underwrite technological change for agriculture and development of non-farm economy, and in over-regulation of agriculture, forestry products, agro-industry, and the nonfarm economy, which benefits neither farmers nor the poor. Others point to high rates of illiteracy, enduring social exclusion, population growth rates that exceed economic growth and protectionist policies that inhibited foreign investment (Roger Harish & Rejesh Rajora, 2006).

**1)Social Environment:** The social environment of each of the projects in the study is made up of the local factors that comprise the intended beneficiaries, their social make up and condition, both before and after the project was implemented, as well as any influence there has been on the relationships

within the community. For example, one often-quoted impact of rural Information Communication Technologies (ICTs) is on the relationship between farmers and traders, whereby the negotiating power of middlemen, which is based on their monopoly over trade information, becomes balanced more in favor of the farmers who can use Information Communication Technologies (ICTs) to obtain the same information that the traders previously with held Information Communication Technologies (ICTs) impacts in rural projects are often sought in gender relations, advancing women's equality, and in increased incomes, directly reducing income poverty (Senthilkumaran, S. and Arunachalam, Subbaiah, 2003)

**2)E-Governments Service:**Attention must also focus on grass-roots reaction to and utilization of e-government services, and A Ram, Chief Sub-Editor at The Hindu Newspaper. There is apprehension among some Government employees the e-government may involve reduction of government jobs; and those who actually do launch e-government initiatives must be responsive to e-mail queries and not-just be content with publishing reams of Government statistics online. Good case studies and success stories of e-government must be documented, urged A Ram. For instance, the Gujarat Road Transport Department's computerized check-post project has eliminated corruption posts on the state's borders, and increased revenue from Rs.60 crore in 1998-99 to Rs.250 crore in 1999-2000 (44 rupees = 1 USD; 1 crore = 10 million).

**3)Non-state Actors:**E-government also has a role for the private sector, academic institutes, the news media, and NGOs. Companies active in e-government services in other parts of the world – such as IBM, EDS and NCR – are stepping up operations in India as well. “ Our kiosk solutions offer e-government services like payment of traffic fines, utility bills, land and income taxes, and provident fund payments in Singapore. Our partners in Southeast Asia include Singapore's DBS Bank and Malaysia Airlines, “ said Srinivasa Rao, business head for self-service solutions at NCR India. NCR's business clients for kiosks solutions, cash dispensers, ticketing machines, check clearance, barcode scanning and data ware housing include leading airlines, telecom providers and retailers; it also provides government services in Brazil and Egypt. Large International Companies like NIIT and Aptech are playing a big role in skill building and software solutions for e-government ; but this leaves out many of the smaller Information Technology (IT) players who cannot tap into these government contracts, complained Hari Padmanabhan of Unitech Computers. In addition to offering services like examination results online, academic institutes must gear up for re-orienting their syllabus towards new media, said Leela Rao, Academic Director at Manipal Institute of Communication. Indian Universities also need to create databases of their academic publications like journals and dissertations, an area where academic publishing in India considerably lags behind its counterparts in the West.

**4)IT Triangle:**While the “IT Triangle “ of the cities Bangalore, Chennai and Hyderabad is showing good progress in e-government, other areas need to catch up fast. Today, most State Governments in India have some degree of departmental computerization under way; many have basic informational websites, and some even have IT Secretaries and IT Parks. Tamil Nadu is making notable progress in online citizen services in Tamil and English, especially Web-based information about land records, birth/death certificates, subsidy schemes, GIS systems, college admission forms, and examination results. “ One must not under-estimate the cultural problems involved in creating such team spirit and open sharing of knowledge, “ warned Anandkrishnan. In addition to “ pushing “ information from government to citizens, the Internet can also open up a channel for citizens to communicate their grievances directly to Government, said P.Subramaniam, a World Bank consultant on e-government. Such public grievances can be aired online for electricity cuts, water supply, phone connections, ration cards, sanitation facilities, and transport services.

**5) Analysis of Social and Economic Impact:** The scope of e-government as it is implemented today is not wide enough to have generated a macro level impact which is discernible through studies of macro indicators. Investments in e-government are relatively small to have created such a macro impact. Tables had presented a number of applications that have demonstrated a variety of economic impacts both direct and indirect, and short term and long term. The following types of economic impacts have been demonstrated: increase in revenue collections in government, increasing attractiveness for investors, improving service delivery to business, improving transparency and reducing costs in government procurement, and improved financial management in Government. The following Table also catalogued applications that have demonstrated a social impact in different countries. The following types of social impact has been demonstrated: poverty alleviation, empowerment of citizens, increased transparency, and lowered corruption in service delivery ten of the applications that demonstrate a social or economic impact have been included as a one page case study in this report in section. These cases will help the reader to understand the context of the application. The table below conceptualizes how E-Government applications help in achieving the social and economic impacts. Remaining part of this section then analyzes the What and How of economic and social impact of E-Government on the basis of the ten applications presented as case studies.

#### **Social Impact-**

**a) Increased Transparency and Reduced Corruption-**Although few Governments have explicitly stated transparency as a goal, some transparency gains have been achieved through e-applications. The website received favorable attention in the press and enabled transparency. While there has been initial success. The system allowed the public to track the process from beginning to end. The success of the system is attributed to the commitment from the Mayor, who led the initiative. Another success factor was the reengineering, greater access to information, improved communication with citizens, which led to greater transparency overall. In the case of CARD the land property registration system in A.P., reducing corruption was deliberately never a stated goal of the project because it was feared any project with explicit goal to curb corruption would encounter greater resistance from employees. In A.P's case, corruption was reduced as a result of reducing the number of intermediaries.

#### **b) Increasing Efficiency and Effectiveness of Service Delivery-**

Many projects have boasted impressive efficiency gains in terms of cutting the number of steps involved, cutting the timeframe, and reducing the number of agencies that need to be consulted. These gains have been achieved because processes get automated requiring less time. Some of the efficiency benefits reported by different applications are:

- Faster processing, shorter wait, and shorter queues.
- Less number of trips to Government offices: saves transport cost and avoids wage loss.
- More accurate and legible documents, easy recovery from errors, better reception areas.
- Lesser corruption and more transparency
- Improved access to offices (delivery points are closer and sometimes available 24 X7).

#### **C) Combating Corruption through E-government-**

##### ***E-Government applications reduce corruption in the public sector:***

- Introduce transparency in data, decisions/actions, rules, procedures and performance of Government agencies.
- Automates processes to take away discretion from civil servants to delay and deny a service.
- Provide a convenient entry point for simplification of rules and re- engineering processes. Almost all applications have done partial re-engineering.

- Make decisions traceable so that action can be taken in case of a complaint.
- Builds accountability by providing greater access to information through web publishing to civil society groups.
- Provides documentation to citizens for follow up action in case they wish to file a complaint.
- Modularizes tasks making outsourcing possible.
- Introduces competition amongst electronic delivery channels and departmental counters that provide a service.
- Standardization of comments/objections on petitions and applications of citizens leads to effective supervision.
- Centralizes data becomes available for better audit and analysis. This feature is being used effectively by e-tax applications. Integration of data across applications provides improved intelligence. Enables unbiased sampling for audit purposes.

**c) Empowerment of Rural Communities-**

The following conclusions can be drawn from the successes and failures among the pilot rural tele-center projects:

- Rural populations are willing to pay a fee for systems that have very clear business or personal uses.
- Villagers are not enamored of electronic delivery. The uptake depends on whether significant value is being delivered in comparison with the existing ways of receiving information and services.
- Intermediaries are often needed to respond to the specific information needs of rural citizens and to interpret and disseminate the knowledge from public documents.

**Economic Impacts-**

- a) **Cost Reduction in Service Delivery-**Although many applications in developing countries have shown significant benefits, in general, cost reduction has not taken place. In most cases E-Government becomes an additional channel to offer services. Even in developed countries where Internet penetration is high, the proportion of citizens using portal for services is low. Until this proportion reaches a level that there can be some cut back in the number of personnel employed in delivering services through the traditional departmental channel or telephone, there will be little reduction in costs. In fact initially the costs will rise on account of investments in organizing electronic delivery. In the developed countries, privacy and security issues seem to be holding the citizens back. In the developing countries the Internet penetrations are very low.
- b) **Control of Government Expenditure-**Many countries have implemented integrate financial management systems to track and control payments made out of Government treasuries. For example the state of Karnataka has connected all its 215 treasuries through a satellite based net. Every payment is now centrally authenticated to ensure that a budget provision exists for the payment and that it is not exceeded. Such systems focus on expenditure control, not exploiting the full potential of the system to combat corruption and improve service delivery. Experience suggests that it is difficult to implement IFIMIS as they are complex and need to be comprehensive in their scope to deliver concrete benefits. Another strategy to control expenditure is to introduce paper less offices in large Government departments (see eSAT in Mexico, SmartGov in Andhra Pradesh). A few of such applications have been implemented.
- c) **Growth of tax Revenue-**The inefficient collection of taxes in many developing countries has led to cash-strapped governments that are incapable of enforcing tax payments. Moreover, corruption in the collection process leads to less money going to the government and lack of public confidence in the system. Modernizing Tax Systems through E-Government applications has been a priority for

many countries. Through online tax filing and processing system, governments aim to reduce the corruption and enhance transparency to create more public trust. Computerized interstate check posts in Gujarat, India, have resulted in three-fold increase in tax collection over 2 years. Revenue increased from \$12 million to \$50 million, paying back the total project costs of \$34 million in just 6 months (Vijayalaxmi & Padma,).

**Details of the socio-economic impact of E-Government-**

Social Impact goals	How E-Government can help?
Increasing Transparency	1. Dissemination of Government rules and procedures, citizen’s charter, government performance to a wider audience. 2. Disclosure of public assets, government budget, and procurement information. 3. Making decisions and actions of civil servants transparent.
Reducing Administrative Corruption	1. Putting procedures online so that transactions can be easily monitored. 2. Reduce the gatekeeper role of civil servants through automated procedures that reduce discretionary powers. 3. Eliminate the need for intermediaries
Improving Service Delivery	1. Less time in completing transactions. 2. Reduce costs associated with travel for citizens to interact with government. 3. Improve government ability to deliver service to larger segment of population
Empowerment	1. Provide un-served communities (limited access to government) with a new channel to receive government services and information. 2. Reduce the brokerage power of intermediaries.

Economic Impact Goals	How E-Government can help?
Streamlining administrative process	1. Increase ability of managers to monitor task completion rates of civil servants. 2. Improve efficiency of civil servants by automating tedious work. 3. Integration of databases, reducing inaccuracies caused by the presence of redundant, duplicate databases. 4. Increase speed and efficiency of inter-and intra-agency workflow and data exchange.
Reducing Administrative	1. Faster access to government and less time needed to interact with

burdens for business	government.  2. Reduction of interlocutors between government and individual.
Increasing Revenue	1. Make it convenient to pay taxes.  2. Improved audit to identify defaulters.  3. Plug leakage by reducing corruption
Cost Reduction and Budget savings	1. Reduce cost of transactions for government processes.  2. Provide better control of expenditure

**Conclusion-** No developing country is likely to be fully ready to embrace a comprehensive program of E-Government. Making e-government widespread entails bridging the digital divide which involves providing access to the Internet to rural areas and setting up of information. A few political leaders and civil servants, who believe in the idea of reform and have initiated innovative applications,. The vast majority, however, is yet to awaken to the potential of e-government for reform. A major task is to build institutional capacity for governance reform. The overall social and economic impact of e-government in developing countries may at best be marginal because the investments that have been made so far are small. It is therefore difficult to make a recommendation that investment in e-government should be stepped up to a certain level. The challenge is to promote widespread use.

## E-BANKING IN INDIA- AN OVERVIEW

**Prof. Aher Ramdas Balasaheb**

*Art's, Commerce & Science College Talegaon Dighe*

### **Introduction:-**

E- banking is your personal banking service the internet protected with bank identifies. E- banking allows you to pay invoices to finish and foreign recipients easily and securely. You can also to pay invoice to finish and foreign recipients easily. You can also check your account balance and transaction . you access E-banking service by obtaining bank identifiers. E-banking allows you to pay invoice to finish and foreign recipients easily. E-banking is the Electronic bank that provide the financial service for the individual client. There are many service provide by bank to customer. Customer inquiry about the information of account ,such that the client inquires about the details of his accounting formation such as cards ,account balance and details historical records of the account. The client can achive the fund to another person credit card in the same city, other the client can achive the fund transfer between his own bank saving account of his own credit card account. Client can inquiry about the present balance at real time. The bank provide various service under E-banking system.

### **Recent Trends in Banking sector:**

1. **Internet :-** Internet is net working of computer. In this marketing message can be transferred and received world wide. The data can transfer through by internet this net can work as electronic base system. We can make contact with anyone who is a liked with internet. Internet is fast developing net and is of utmost important for various sector wise, Research organization, public sector, Education institution etc.
2. **Automated teller machine(ATM):** -Automated teller machine is the most popular device in India .the customer to without their money 24 hours in day a week. It is a device that allow customer who an ATM card. This is a plastic card, which bears the customer name .ATM card to perform routine banking transaction without interacting with human teller in addition to cash withdrawal ,amount used for payment of utility bills ,deposit of cheque ,deposit cash into account, fund transfer two more accounts.
3. **Electronic Fund Transfer:-** Electronic Fund Transfer is a transfer where in funds transfer from one place to another place without manual efforts by taking the use of computer and telecommunication with in 48 hours. The customer has to sign a form that authorize his bank to deduct payment on certain date the customer also has to give details like the beneficiary name ,his account number amount to be deducted etc. RBI is the service provider of EFT.
4. **National Electronic Fund Transfer {NEFT}:** -It is a nation –wide payment system facility one to one funds transfer under this scheme, individual firm and corporate can electronically transfer funds from any bank branch to any individual firm having an account with any other bank branch in the country participating in the scheme. NEFT is a simple ,safe ,fast cost effective way to transfer funds especially for retail remittance . customer can use this facility between 8am to 7pm on all week and days. The money will be credited to the account holder account on the same day.
5. **Real Time Gross Settlement [RTGS]:**-Real time gross settlement system, introduced in India since march 2004, is a system through fund transfer to one place to another place in few days. RTGS system is a comprehensive and secured online payment mechanism. RTGS system is maintain by the RBI and provide a means of efficient facility their financial operation under RTGS system . this system provide various advantages to beneficiary, comes under transfer funds quickly

,increasing the velocity of money circulation reducing risk of transfer of funds etc .money can reach beneficiary account within 2 hours.

6. **Society for Worldwide Inter-Bank Financial Telecommunication [SWIFT]:** -The SWIFT as a co-operative was formed in may 1973 with 239 participating bank form 15 countries with its headquarters at Brussels. It operates in India also through selected banks. SWIFT provide have rapid , secure ,reliable and cost effective mode of transmitting the financial message worldwide. This system enables international member bank to transact money business between them quickly, at present more than banks are the member of the network in later stage electronic teller were introduced, private international agencies like SWIFT also introduced SWIFT-2 system. This network also provide facilities transfer of message relating fixed deposit, debit credit statement, foreign exchange etc. SWIFT services benefit to customer Brokers and other agents.
7. **Telephone Banking:** -In telephone banking transaction is done over the telephone. customer of banks can get information about their accounts; make banking transaction like fixed deposit ,demand draft collection and payment of bills and money transfer etc. Telephone banking also possible with help of mobile phone. Customer get their cheque book and latest account statement delivered to them. Money transfer can possible with help of telephone banking .customer can request the bank to stop payment of a particular cheque by using phone banking service. request can be made with the help of phone banking customer can the latest information about interest rates prevailing along with the foreign exchange rates.
8. **Mobile Banking:** -Mobile banking is well accepted and widely available at an minimum price . it is also suitable for banking and payment services to each and every individual respective place. Mobile banking reduce this very limiting of internet banking. mobile banking reduce the customer requirement. Mobile banking provide various facilities to customer , is that information about the update account balance without using internet. Fund transfer can be made possible with help of mobile banking. Mobile banking provides the facility of de- mat inquiry to the customer such that DTH, mobile recharge can done with the help of mobile banking Account. online payment can pay possible through by mobile banking.
9. **Internet Banking:** - Internet technology has totally transfer the design of business. The success of internet banking operation totally depends on the well designed website of the bank. It should be informative ,functional ,user-friendly and most importantly secured. Internet Banking lets clients handle many banking transaction via their personal computer. For transfer through by laptop, computer, smart-phone our account balance ,request transfer between accounts and bills electronically. many services provide by Internet banking system such that customer can change transaction password, account opening request can be made online, customer can make online payment of service tax, income tax, house tax, booking of railway and air ticket etc, service can be done with the help of Internet Banking.
10. **Electronic Clearing Cards:** -Electronic clearing cards such as debit & credit cards. Debit cards allows any where any time accesses to the customer with their account. A customer possessing a Debit card need not carry cash. Credit card also serve as convenient medium of exchange. both two cards also provide service to customer any where any time. It enables a customer to purchase goods or services within prescribed limits certain authorized retails and service setup without making cash payment. It is also called plastic money . the basic difference between a Debit card and Credit card is that while credit card is a post paid and Debit card is pre-paid.

#### **Challenges In Adoption E-Banking:**

1]The most serious threat faced by e-banking that is not safe and secure all the time , because there maybe loss of data due to technical defaults.

2] E-Banking are facing business challenges for the transaction made through internet, the service charges are very low.

3] Their lack of preparedness both on part of banks and customer in the adoption of new technological changes.

4]There is lack of proper infrastructure for the installation of e- delivery channels.

5]Understanding the usage of internet banking might be difficult for new person at the first go

6]Security and transaction is a big issue your account information might get hacked by unauthorized people over the internet.

7]Difficult to note whether your transaction was successful or not.

8]Difficult to understand for illiterate person.

9]Password security is a must .after receiving your password ,do change it and memorize it otherwise your account may be misused by someone who gets to know your password inadvertently.

10]You can not use it ,in case, the bank's server is down.

#### **Recommendation:**

- Special arrangements should be made by banks to ensure full security of customer funds.
- E-Banks should create awareness among people about E-banking products and service. Customer should be made literate about the use of E-Banking products.
- Technical defaults should be avoided by employing well trained and expert technicians in field of computer, so that loss of data can be avoided.
- Seminar and workshops should be organized on the health usage of e-banking especially for those who are ATM or computer illiterate.
- E-Banking service should be customized on basis of age, gender ,occupation so that needs and requirement of people are met accordingly
- Government should make huge investment for building the infrastructure facility.
- The continuance of the trend has re-defined and re-engineered the banking operation as whole with more well through leveraging technology.

**Conclusion ;** E-Banking seems poised to become an important part of Indian banking sector in the few years. Indian Banking are making sincere efforts for the adoption of advantage technology of e – delivery system. It is sure that the future of banking will offer more sophisticated service to the customer in new format .Youth generation is beginning to see the benefit of E-Banking. E-Banking services with E-Commerce service s online payment service increase and reach of the internet and the entry of global players in the banking sector. E-banking is a borderless entity permitting anytime ,anywhere anyhow banking. this facility us with all the function and many advantages as compared to traditional banking services.

**INDIA'S TRADE WITH SAARC COUNTRIES****Mr. Thorat Kirankumar Dilip**

(Ph.D. Research Scholar Dept. of Economics, S.M.B.S.T. College of Sangamner.)

**Intorduction :** One of the most important objectives of various regional economic grouping of Asia, Africa and Lain America is to expand intra-regional trade. The various regional groupings emerged since 1950s are like European community (EC), Southern African Development Coordination Council (SADC), Common Market of the southern Cone community of Nation (Andean), The Association of South East Asian Nations (ASEAN), South Asia Association for Regional Cooperation (SAARC) and Gulf Cooperation Council (GCC) one of the basic objectives behind all these associations is to expand the inter-regional and intra-regional trade among themselves.

**SAARC Formation :** India has a very important role to play in the SAARC, being the most resourceful member of Association. Political hostilities of some of the neighbors, however, pose problems. The South SAARC comprising seven countries. Namely, India, Pakistan, Bangladesh, Nepal, Sri Lanka, Bhutan and the Maldives was formally launched in December 1985.

**Trade with SAARC countries :** As shown in table I , it was evident that India's trade with SAARC, in which India a member, was not as encouraging as had been registered in respect of OECD, OPEC and E.V. It was observed from the table I. that, India's trade with SAARC countries had been favorable throughout the study period from 1994-95 to 2010-11. India's exports to SAARC were more than doubled between 1994-95 and 2000-01. During this period the exports were increased by 130.93 per cent. Between 2001-02 and 2005-06, the compound growth rate of exports was substantial with 154.19 per cent growth rate of exports in respect of SAARC countries, was registered at 97.76 per cent in 2010-11 over the period 2006-07. India's imports from the SAARC were erratic while several times rising and declining in some years. During the period form 1994-95 to 2000-01, the compound growth rate of import was recorded remarkably at 283.49 per cent in 2000-2001; the compound growth rate of imports was not as high as had been recorded in earlier period. It was recorded at 150.23 per cent in 2006-07 over 2000-01. Between 2007-08 and 2010-11, the compound growth rate of imports was very low in respect of SAARC coutnires. The growth rate of imports was registered at 8.17 per cent in 2010-11 over the period of 2007-08.

**Table 1 Direction of India's trade with SAARC Countries (Rs. in crores)**

Year	Total Trade (Rs. crores)		S A A R C Countries				
	Exports	Imports	Export	% in total exports	Imports	% in total exports	Balance of Trade
1994-95	82674.1	89970.7	3815.1	4.61 %	554.9	6.15 %	3260.2
1995-96	106353.3	122678.1	5755.3	5.41 %	858.0	0.69 %	4897.3
1996-97	118817.1	138919.7	6040.8	5.08 %	857.6	0.61 %	5183.2
1997-98	130100.6	154176.3	5986.9	4.60 %	870.8	0.56 %	5116.1
1998-99	139753.1	178331.9	7064.6	5.05 %	1958.6	1.09 %	5106
1999-00	159561.4	215236.5	6043.3	3.78 %	1723.1	0.80 %	4320.1

2000-01	203571.0	230872.8	8810.4	4.32 %	2128.0	0.92 %	6682.4
2001-02	209018.0	245199.7	9662.4	4.62 %	2725.7	1.11 %	6936.7
2002-03	255137.3	297205.9	13183.5	5.16 %	2477.7	0.83 %	10705.8
2003-04	293366.8	359107.7	19061.0	6.49 %	3073.2	0.85 %	15987.8
2004-05	375339.5	501064.5	19952.7	5.31 %	4269.3	0.82 %	15683.4
2005-06	456417.9	660408.9	24561.4	5.38 %	6257.2	0.94 %	18304.2
2006-07	571779.9	840506.3	29274.0	5.11 %	9820.7	0.81 %	22453.3
2007-08	655863.5	1012311.8	38719.7	5.90 %	8500.6	0.83 %	30219.1
2008-09	840755.1	1374435.6	38820.8	4.61 %	8264.5	0.60 %	30556.3
2009-10	845534	1363736	39648.0	4.68 %	7836.9	0.57 %	31811.1
2010-11	1157475	1605314.6	57893.6	5.00 %	9195.2	0.57 %	48697.4

**Notes:** Data for 2009-10 are revised ;Data for 2010-11 are provisional.

**Source:** Directorate General of Commercial intelligence and statistics (DGCI & S)

When we consider the percentage share of SAARC in India's exports, it was observed around 7 per cent. The highest percentage share was recorded at 6.49 per cent in 2003-04. The percentage share of SAARC in Indian imports was very meagre with around one percent only.

Hence, it is essential that effective steps have to be taken to increase the exports to SAARC as a whole, thereby increasing the percentage share of SAARC in India's exports.

**Some more suggestions :**

1. All quantitative restrictions and non-tariff barriers should be eliminated.
2. All items that are brought under SAPTA (Preferential trade) should be actively traded. At present only a few items are actually traded.
3. The fears that bigger partner / country would dominate to the allayed.

Though SAFTA initiated removal of all such barriers, still more dynamic actions are required to speed up the intra - SAARC trade facilitation.

**Conclusion :** SAARC countries should converge into each other to Face boldly the common challenges facing them. With one-fifth of humanity, the SAARC countries are faced with problem of poverty, backwardness, low productivity, unemployment and high pressure of population. The diverse economic features of the SAARC countries can also bring complementarity in forging ahead the trade relations among these countries.

**WOMEN EMPOWERMENT THROUGH MGNREGA****Prof. B. C. Patil**

**Introduction:** The role of employment in reducing poverty is by now widely recognized. But the experience of many developing countries seems to indicate that in recent years, the rate of employment growth has been inadequate. And the growth of labour force that the amount of employment generated as a result of given output growth has been declining. Such situation naturally calls for special efforts and programmes to create more employment. A part from the general inadequacy of employment growth, many developing countries face emergencies like severe droughts, floods and other natural disasters, seasonal decline in labour demand etc. that creates necessity in the labour market in the form of employment creation programmes. Whatever, the developing countries, has a large accumulated experience in this area, especially in the creation of wage employment through the application of labour-based approaches in the construction of infrastructure? So some programmes of job creation are aimed purely at providing safety nets to the poor, there are others which are more integrated into the development programmes of relevant countries and are designed not only as safety. In low- and middle income countries Employment creation programmes are an important policy instrument, especially where rates of unemployment and underemployment are high, the employment intensity of growth is low and macroeconomic shocks or natural disasters can undermine livelihoods and require income-stabilizing interventions. There is a need based generation of employment creation programmes.

**Keywords:** MGNREGA, WOMEN EMPOWERMENT, NAREGA.etc.

**Objectives:**

- 1) To study the role of NAREGA in the women empowerment.
- 2) To study ratio of women participation in the scheme.
- 3) To study the revenue generation by women workers.

**Methodology:**The present study is based on the secondary data which was published by the national & international journals and by government of Maharashtra.

**The concept of MNREGA:**Prior to the enactment of Mahatma Gandhi NREGA, India had no programme in rural areas that promised employment as a legal obligation, although employment generation through rural works had a long history in India. Since 1961 the government had been merging old schemes to introduce new ones while retaining the basic objective of providing additional wage employment involving unskilled manual work, creating durable assets, and improving food security in rural areas through public works with special safeguards for the poor families and women of the community.The Mahatma Gandhi National Rural Employment Guarantee Act (MGNREGA) is an Indian Law that aims to guarantee the “right to work” and ensure livelihood security in rural areas by providing at least 100 days of guaranteed wage employment in a financial year to every households, whose adult members volunteer to do unskilled manual work. The statute is hailed by the government of India as the largest and most ambitious social security and public works programme in the world.

**Concept of Women Empowerment:** Empowerment of women means, developing them as more aware individuals, who are politically active, economically productive and independent and are able to make intelligent discussion in matters that affect them. Women empowerment as a concept was introduced at the International women Conference in 1985 at Nairobi, which defined it as redistribution of social power and control of resources in favour of women.

1. Also developing a sense of self-worth, a belief in one’s ability to secure desired changes and the right to control one’s life.

2. Acquiring knowledge and understanding of gender relations and the way in which these relations may be changed.

**Women Participation in Major States during 2010-11:**

**ROLE OF MGNREGS IN WOMEN EMPOWERMENT:** MGNREGS plays a significant role to meet the practical as well as strategic needs of women’s participation. It has become a beacon of light in the empowerment of the rural women and contributed substantially for the increased living and economic conditions by creating equal wages to male and female workers. The role of MGNREGS on women’s participation can be examined through the following parameters:

**Increasing Income Source:** In India women play a major role in raising the economic resources for their family but their contribution remains uncounted because of they perform a significant amount of unpaid work. In rural and tribal areas, the dominance of males in intra-household decisions has been seen. MGNREGS has significant impact in converting some unpaid work into paid work and widen the scope of decision making role of women in household matters. This scheme was affect on rural unorganized sector women worker’s with respect to increase annual income around 25 to 40 per cent.

**Changing Economic status:** By income-consumption effects we mean an increase in income of women workers and as a result, their ability to choose their consumption baskets from bottom to middle stage. It MGNREGS empowers women by giving them a scope of independent earning and spend some amount for their own needs.

**Increasing consumption:** Women’s participation at the local and district level of governance process is low in spite of 73rd Amendments of the Constitution. But women participation has increased after the implementation of MGNREGS in many areas. A large number of women workers attended the Gram Sabah meeting held in connection with MGNREGS. Community level empowerment of women is one of the great achievements of this Act

**Increase social status of women:** MGNREGA boost to ground level with full potential of growth. Women are able to work any worksite with confidence in the society. They change their approach towards educational, social and cultural etc. In this scheme given same treatment of men and women respect to wages and other facilities, so the view of society has changed direction towards the women.

## THE STUDY OF CHANGING CROPPING PATTERN IN INDIA AFTER GLOBALISATION

**Prof. R. M. Ambekar**

**Introduction:** After independence Indian agriculture sector developed compare to other sectors. In India agriculture sector was depend on purely rainwater. Rivers have been of fundamental importance throughout the history. Early humans wandered from place to place in search of food and water. The river banks have attracted settlers 32 from ancient times. After some time, they realized that settling near river banks gave them easy access to water. When they noticed plants, they observed that these plants produced seeds which could be eaten. In order to grow plants on their own, early humans collected these seeds and spread them near river banks. These seeds turned into plants. Nomads started digging the soil using stone tools to plough the land. This was the beginning of agriculture. These settlements have now become big cities. Thus India is an agro- based country. About half of the population practice agriculture on 60 per cent of land. It earns about 15 per cent of our national income. It is also the principal source of livelihood in rural area. The climate conditions, the existence of huge plains and the fertility of soils make agriculture a profitable business in our country. It has achieved multi faceted socio-economic progress after economic reforms. It has moved forward displaying remarkable progress in the field of agriculture and overall economic development.

**Keywords:** Cropping pattern, Globalization, Green Revolution, Liberalization etc.

**Objectives:**

- 1) To study the Indian agriculture changing cropping pattern after economic reforms.
- 2) To comparative study with different crops with respect to cash crops.
- 3) To study the Indian changing agriculture system.

**Methodology:** The present study is based on the secondary data which was published by the national & international journals and by government of India.

**Globalization:** Globalization can be thought of to be the result of the opening up of the global economy and the concomitant increase in trade between nations. In other words, when countries that were hitherto closed to trade and foreign investment open up their economies and go global, the result is an increasing interconnectedness and integration of the economies of the world.

**Concept of cropping Pattern:** India is the second largest producer of rice in the world after china. This is the staple crop of most of the Indians. It is grown in tropical humid regions over a vast area. It is the pattern of crops for a given piece of land or cropping pattern means the proportion of area under various crops at a point of time in a unit area or it indicated the yearly sequence and spatial arrangements of crops and follows in an area.

**Efficient Cropping Systems:** Efficient cropping systems for a particular farm depend on farm resources, farm enterprises and farm technology because farm is an organized economical unit. The farm resources include land, labour, water, capital and infrastructure. When land is limited intensive cropping is adapted to fully utilized available water and labour when sufficient and cheap labour is available, vegetable crops are also included in the cropping systems as they required more labour. Capital intensive crop like sugarcane, banana, turmeric etc. find a space in the cropping system when capital is not a constraint. In low rainfall regions mono cropping is followed and when rainfall is more than 750 mm, intercropping is practiced, with sufficient irrigation water, triple and quadruple cropping is adopted, when other climatic factors are not limiting farm enterprise like daring, poultry etc. also

influenced the type of cropping system. When the farm enterprises include dairy, cropping system should contain fodder crops as components change in cropping system take place with the developments of technology. The feasibility of growing for crop sequences in Genetic alluvial plains inputs to multiple cropping.

**Study of Changing cropping pattern in India after Globalization:** India happens to be one of the largest growers and producers of most of the agricultural crops but ranks very low in terms of productivity. Its rank is only 52th in the world in rice and 38th in wheat. However in terms of area, India has the largest area under rice and wheat in the world and the second largest producer in these crops. It has the largest area under pulses in the world and is also the world's largest producer of pulses, but in terms of productivity its rank is 138th in the world.

#### Area, Production and Productivity of Major Crops

(Area: Million ha; Prod: Million Tonnes; Yield: kg/ha)

Group	Area		Production		Productivity	
	2013-14	2012-13	2013-14	2012-13	2013-14	2012-13
<b>Commodity</b>						
<b>Food grains</b>	126.2	4.47	264.4	2.88	2095	-1.55
<b>Rice</b>	43.9	2.57	106.3	1.05	2419	-1.75
<b>Bajra</b>	7.9	8.22	9.2	5.75	1161	-3.09
<b>Gram</b>	10.2	20	9.9	12.5	974	-5.98
<b>Oilseeds</b>	28.2	6.42	32.4	4.85	1149	-1.63
<b>Groundnut</b>	5.5	17.02	9.5	102.1	1723	73.17
<b>Rapeseed and</b>	6.5	1.56	7.8	-2.5	1208	-4.28
<b>Cotton</b>	11.7	(-2.50)	36.5	6.73	529	8.85
<b>Sugarcane</b>	5	0	348	2.11	70	0

Source: Directorate of Economics and Statistics, Department of Agriculture and cooperation (DAC), Economic Survey of India 2014-15, Ministry of Finance, Government of India.

On the base of above table India is one of the top countries in agriculture production. Increase in production through increase in area is not possible for the peninsular land and man ratio. It would get still narrow in future. Hence Indian economy should be reorganized as place of intensive agriculture which becomes the basic characteristic of agriculture sector after 1991. Technological improvements in agriculture can be classified into biological and mechanical sections. Under biological section new seeds (HYVP), use of fertilizer in right time at right doses. Mechanical innovations usually mean the use of more machinery like tractors, threshers etc. This framework would become a key factor in the rapid transformation of Indian agriculture in the next 20 years. In developed countries farm mechanization played an important role.

## GST AND INDIAN ECONOMY

**Prof. Smt. Savita Tukaram Bhagwat**

*Research Student, Post Graduate, Research center in Economics, S.M.B.S.T. College , Sangamner, Dist- Ahamadnagar.*

1. **Introduction :-** A tax may be defined as a "pecuniary burden laid upon individuals or property owners to support the Government, a payment exacted by legislative authority. A tax "is not a voluntary payment or donation, but an enforced contribution, exacted pursuant to legislative authority". In simple words, tax is nothing but money that people have to pay to the Government, which is used to provide public services. Taxes are broadly classified into direct and indirect taxes.

**Direct Taxes:** A direct tax is a kind of charge, which is imposed directly on the taxpayer and paid directly to the Government by the persons. A direct tax is one that cannot be shifted by the taxpayer to someone else. A significant direct tax imposed in India is income tax.

**Indirect Taxes:** If the taxpayer is just a conduit and at every stage the tax- incidence is passed on till it finally reaches the consumer, who really bears the brunt of it, such tax is indirect tax. An indirect tax is one that can be shifted by the taxpayer to someone else. Indirect taxation in India has witnessed a paradigm shift on July 01, 2017 with usherance into a unified indirect tax regime wherein a large number of Central and State indirect taxes have been amalgamated into a single tax – Goods and Services Tax (GST). GST is one indirect tax for the whole nation, which will make India one unified common market. GST is a single tax on the supply of goods and services, right from the manufacturer to the consumer. Credits of input taxes paid at each stage will be available in the subsequent stage of value addition, which makes GST essentially a tax only on value addition at each stage. The final consumer will thus bear only the GST charged by the last dealer in the supply chain, with set-off benefits at all the previous stages.

**Goods and Services Tax (GST)** is an indirect tax which was introduced in India on 1 July 2017 and was applicable throughout India which replaced multiple cascading taxes levied by the central and state governments. It was introduced as The Constitution (One Hundred and First Amendment) Act 2017, following the passage of Constitution 122nd Amendment Act Bill. The GST is governed by a GST Council and its Chairman is the Finance Minister of India. Under GST, goods and services are taxed at the following rates, 0%, 5%, 12%, 18% and 28%. There is a special rate of 0.25% on rough precious and semi-precious stones and 3% on gold. In addition a cess of 22% or other rates on top of 28% GST applies on few items like aerated drinks, luxury cars and tobacco products. GST replaced a slew of indirect taxes with a unified tax and is therefore set to dramatically reshape the country's 2 trillion dollar economy

2. **HISTORY :-** The reform process of India's indirect tax regime was started in 1986 by Vishwanath Pratap Singh, Finance Minister in Rajiv Gandhi's government, with the introduction of the Modified Value Added Tax (MODVAT). Subsequently, Manmohan Singh, and the Finance Minister P V Narasimha Rao, initiated early discussions on a Value Added Tax at the state level. A single common "Goods and Services Tax (GST)" was proposed and given a go-ahead in 1999 during a meeting between the then Prime Minister Atal Bihari Vajpayee and his economic advisory panel, which included three former RBI governors IG Patel, Bimal Jalan and C Rangarajan. Vajpayee set up a committee headed by the then finance minister of West Bengal, Asim Dasgupta to design a GST model. The Ravi Dasgupta committee was also tasked with putting in place the back-end technology and logistics (later came to be known as the GST Network, or GSTN, in 2017) for rolling out a uniform taxation regime in the country.

In 2002, the Vajpayee government formed a task force under Vijay Kelkar to recommend tax reforms. In 2005, the Kelkar committee recommended rolling out GST as suggested by the 12th Finance Commission. After the fall of the BJP-led NDA government in 2004, and the election of a Congress-led UPA government, the new Finance Minister P Chidambaram in February 2006 continued work on the same and proposed a GST rollout by 1 April 2010. However in 2010, with the Trinamool Congress routing CPI(M) out of power in West Bengal, Asim Dasgupta resigned as the head of the GST committee. Dasgupta admitted in an interview that 80% of the task had been done.

In 2014, the NDA government was elected into power, this time under the leadership of Narendra Modi. With the consequential dissolution of the 15th Lok Sabha, the GST Bill – approved by the standing committee for reintroduction – lapsed. Seven months after the formation of the Modi government, the new Finance Minister Arun Jaitley introduced the GST Bill in the Lok Sabha, where the BJP had a majority. In February 2015, Jaitley set another deadline of 1 April 2017 to implement GST. In May 2016, the Lok Sabha passed the Constitution Amendment Bill, paving way for GST. However, the Opposition, led by the Congress, demanded that the GST Bill be again sent back to the Select Committee of the Rajya Sabha due to disagreements on several statements in the Bill relating to taxation. Finally in August 2016, the Amendment Bill was passed. Over the next 15 to 20 days, 18 states ratified the GST Bill and the President Pranab Mukherjee gave his assent to it. A 22-members select committee was formed to look into the proposed GST laws. State and Union Territory GST laws were passed by all the states and Union Territories of India except Jammu & Kashmir, paving the way for smooth rollout of the tax from 1 July 2017. The Jammu and Kashmir state legislature passed its GST act on 7 July 2017, thereby ensuring that the entire nation is brought under an unified indirect taxation system. There was to be no GST on the sale and purchase of securities. That continues to be governed by Securities Transaction Tax (STT).

## 2. FEATURES OF INDIRECT TAXES

- 1) **An important source of revenue:** Indirect taxes are a major source of tax revenues for Governments worldwide and continue to grow as more countries move to consumption oriented tax regimes. In India, indirect taxes contribute more than 50% of the total tax revenues of Central and State Governments.
- 2) **Tax on commodities and services:** It is levied on commodities at the time of manufacture or purchase or sale or import/export thereof. Hence, it is also known as commodity taxation. It is also levied on provision of services.
- 3) **Shifting of burden:** There is a clear shifting of tax burden in respect of indirect taxes. For example, GST paid by the supplier of the goods is recovered from the buyer by including the tax in the cost of the commodity.
- 4) **No perception of direct pinch:** Since, value of indirect taxes is generally inbuilt in the price of the commodity, most of the time the tax payer pays the same without actually knowing that he is paying tax to the Government. Thus, tax payer does not perceive a direct pinch while paying indirect taxes.
- 5) **Inflationary:** Tax imposed on commodities and services causes an all-round price spiral. In other words, indirect taxation directly affects the prices of commodities and services and leads to inflationary trend.
- 6) **Wider tax base:** Unlike direct taxes, the indirect taxes have a wide tax base. Majority of the products or services are subject to indirect taxes with low thresholds.

- 7) **Promotes social welfare:** High taxes are imposed on the consumption of harmful products (also known as 'sin goods') such as alcoholic products, tobacco products etc. This not only checks their consumption but also enables the State to collect substantial revenue.
- 8) **Regressive in nature:** Generally, the indirect taxes are regressive in nature. The rich and the poor have to pay the same rate of indirect taxes on certain commodities of mass consumption. This may further increase the income disparities between the rich and the poor.

### 3. CONCEPT OF GST

- 1) GST is a value added tax levied on manufacture, sale and consumption of goods and services.
- 2) GST offers comprehensive and continuous chain of tax credits from the producer's point/service provider's point upto the retailer's level/consumer's level thereby taxing only the value added at each stage of supply chain.
- 3) The supplier at each stage is permitted to avail credit of GST paid on the purchase of goods and/or services and can set off this credit against the GST payable on the supply of goods and services to be made by him. Thus, only the final consumer bears the GST charged by the last supplier in the supply chain, with set-off benefits at all the previous stages.
4. **GST Advantages and Disadvantages** The GST is a Value added Tax (VAT) is proposed to be a comprehensive indirect tax levy on manufacture, sale and consumption of goods as well as services at the national level. It will replace all indirect taxes levied on goods and services by the Indian Central and State governments. Though GST is considered to be a historical tax reform in India, it also has some demerits. We here would look into GST Taxation and deal with its advantages and disadvantages.

#### a. GST Advantages

1. GST is a transparent tax and also reduce number of indirect taxes.
2. GST will not be a cost to registered retailers therefore there will be no hidden taxes and the cost of doing business will be lower.
3. Benefit people as prices will come down which in turn will help companies as consumption will increase.
4. There is no doubt that in production and distribution of goods, services are increasingly used or consumed and vice versa.
5. Separate taxes for goods and services, which is the present taxation system, requires division of transaction values into value of goods and services for taxation, leading to greater complications, administration, including compliances costs.
6. In the GST system, when all the taxes are integrated, it would make possible the taxation burden to be split equitably between manufacturing and services.
7. GST will be levied only at the final destination of consumption based on VAT principle and not at various points (from manufacturing to retail outlets). This will help in removing economic distortions and bring about development of a common national market.
8. GST will also help to build a transparent and corruption free tax administration.
9. Presently, a tax is levied on when a finished product moves out from a factory, which is paid by the manufacturer, and it is again levied at the retail outlet when sold.
10. GST is backed by the GSTN, which is a fully integrated tax platform to deal with all aspects of GST.

#### b. GST Disadvantages

1. Some Economist say that GST in India would impact negatively on the real estate market. It would add up to 8 percent to the cost of new homes and reduce demand by about 12 percent.

2. Some Experts says that CGST(Central GST), SGST(State GST) are nothing but new names for Central Excise/Service Tax, VAT and CST. Hence, there is no major reduction in the number of tax layers.
3. Some retail products currently have only four percent tax on them. After GST, garments and clothes could become more expensive.
4. The aviation industry would be affected. Service taxes on airfares currently range from six to nine percent. With GST, this rate will surpass fifteen percent and effectively double the tax rate.
5. Adoption and migration to the new GST system would involve teething troubles and learning for the entire ecosystem.

#### **6. FRAMEWORK OF GST AS INTRODUCED IN INDIA**

- 1) **Dual GST:-** India has adopted a dual GST which is imposed concurrently by the Centre and States, i.e. Centre and States simultaneously tax goods and services. Centre has the power to tax intra-State sales & States are empowered to tax services. GST extends to whole of India including the State of Jammu and Kashmir.
- 2) **CGST/SGST/UTGST/IGST :-** GST is a destination based tax applicable on all transactions involving supply of goods and services for a consideration subject to exceptions thereof. GST in India comprises of Central Goods and Service Tax (CGST) - levied and collected by Central Government, State Goods and Service Tax (SGST) - levied and collected by State Governments/Union Territories with State Legislatures and Union Territory Goods and Service Tax (UTGST) - levied and collected by Union Territories without State Legislatures, on intra-State supplies of taxable goods and/or services. Inter-State supplies of taxable goods and/or services are subject to Integrated Goods and Service Tax (IGST). IGST is approximately the sum total of CGST and SGST/UTGST and is levied by Centre on all inter-State supplies
- 3) **Legislative Framework :-** There is single legislation – CGST Act, 2017 -for levying CGST. Similarly, Union Territories without State legislatures [Andaman and Nicobar Islands, Lakshadweep, Dadra and Nagar Haveli, Daman and Diu and Chandigarh] are governed by UTGST Act, 2017 for levying UTGST. States and Union territories with their own legislatures [Delhi and Puducherry] have their own GST legislation for levying SGST.
7. **Registration:** Every supplier of goods and/ or services is required to obtain registration in the State/UT from where he makes the taxable supply if his aggregate turnover exceeds ` 20 lakh during a FY. However, the limit of ` 20 lakh will be reduced to ` 10 lakh if the person is carrying out business in the Special Category States – [11 Special Category States are specified in Article 279A(4)(g) of the Constitution] - States of Arunachal Pradesh, Assam, Jammu and Kashmir, Manipur, Meghalaya, Mizoram, Nagaland, Sikkim, Tripura, Himachal Pradesh and Uttarakhand.
8. **Exemptions:** Apart from providing relief to small-scale business, the law also contains provisions for granting exemption from payment of tax on essential goods and/or services.
9. **Impact of GST on the Indian Economy:** GST the biggest tax reform in India founded on the notion of “one nation, one market, one tax” is finally here. The moment that the Indian government was waiting for a decade has finally arrived. The single biggest indirect tax regime has kicked into force, dismantling all the inter-state barriers with respect to trade. The GST rollout, with a single stroke, has converted India into a unified market of 1.3 billion citizens. Fundamentally, the \$2.4-trillion economy is attempting to transform itself by doing away with the internal tariff barriers and subsuming central, state and local taxes into a unified GST. The rollout has renewed the hope of India’s fiscal reform program regaining momentum and widening the economy. Then again, there are fears of disruption, embedded in what’s perceived as a rushed transition which may not assist

the interests of the country. Will the hopes triumph over uncertainty would be determined by how our government works towards making GST a “good and simple tax”. The idea behind implementing GST across the country in 29 states and 7 Union Territories is that it would offer a win-win situation for everyone. Manufacturers and traders would benefit from fewer tax filings, transparent rules, and easy bookkeeping; consumers would be paying less for the goods and services, and the government would generate more revenues as revenue leaks would be plugged. Ground realities, as we all know, vary. So, how has GST really impacted India? Let’s take a look.

10. **GST: The Short-Term Impact:** From the viewpoint of the consumer, they would now have pay more tax for most of the goods and services they consume. The majority of everyday consumables now draw the same or a slightly higher rate of tax. Furthermore, the GST implementation has a cost of compliance attached to it. It seems that this cost of compliance will be prohibitive and high for the small scale manufacturers and traders, who have also protested against the same. They may end up pricing their goods at higher rates.
11. **What the Future Looks Like:** Talking about the long-term benefits, it is expected that GST would not just mean a lower rate of taxes, but also minimum tax slabs. Countries where the Goods and Service Tax has helped in reforming the economy, apply only 2 or 3 rates – one being the mean rate, a lower rate for essential commodities, and a higher tax rate for the luxurious commodities. Currently, in India, we have 5 slabs, with as many as 3 rates – an integrated rate, a central rate, and a state rate. In addition to these, cess is also levied. The fear of losing out on revenue has kept the government from gambling on fewer or lower rates. This is very unlikely to see a shift anytime soon; though the government has said that rates may be revisited once the RNR (revenue neutral rate) is reached.

The impact of GST on macroeconomic indicators is likely to be very positive in the medium-term. Inflation would be reduced as the cascading (tax on tax) effect of taxes would be eliminated. The revenue from the taxes for the government is very likely to increase with an extended tax net, and the fiscal deficit is expected to remain under the checks. Moreover, exports would grow, while FDI (Foreign Direct Investment) would also increase. The industry leaders believe that the country would climb several ladders in the ease of doing business with the implementation of the most important tax reform ever in the history of the country.

## **A VIEW ON E-BUSINESS**

**Dr.Tajane Umesh Annasaheb**

*Arts, Commerce and Science College, Satral, Tal.Rahuri, Dist.Ahmednagar*

**Introduction:** E Commerce stands for electronic commerce and caters to trading in goods and services through the electronic medium such as internet, mobile or any other computer network. It involves the use of Information and Communication Technology (ICT) and Electronic Funds Transfer (EFT) in making commerce between consumers and organizations, organization and organization or consumer and consumer. With the growing use of internet worldwide, Electronic Data Interchange (EDI) has also increased in humungous amounts and so has flourished e-commerce with the prolific virtual internet bazaar inside the digital world which is rightly termed as e-malls. So that we do not end up splitting hair, it is best to understand e-business with the help of examples:

- Email marketing to existing customers and prospects is an e-business activity, as it electronically conducts a business process -- in this case marketing.
- An online system that tracks inventory and triggers alerts at specific levels is also e-business. Inventory management is a business process. When facilitated electronically, it becomes part of e-business.
- A content management system that manages the workflow between a content developer, editor, manager, and publisher is another example of a business. In the absence of an electronic workflow, the physical movement of paper files would conduct this process. By electronically enabling it, we are now in the realm of e-business.
- An online induction program for new employees automates part of the whole of its offline counterpart.

I guess you get the idea. As long as something is a business process conducted on electronic networks, it is fair to call it an e-business process.

**Conducted Online:** Some authors have taken the view that an e-business is not about business processes being conducted electronically. Instead, an e-business is a special type of business -- one that exists online. So if you are an advisory firm helping people choose the right furniture, then you are a business. But if you run a website where people can compare furniture options, then you are an e-business. This view of an e-business is significantly more limited in its scope. And in this avatar, it starts getting synonymous with e-commerce.

**Real E-business Please Stand Up:** What exactly is e-business? It is not a question that bothers me too much, as it is simply a matter of semantics. My jargon is not necessarily superior to your jargon. But deliberating over the e-business vs. e-commerce dilemma is not a complete waste of time. Unless I understand the intended meaning of the speaker, I am likely to misinterpret. Imagine the confusion that would be caused by a piece of legislation that talks about e-business, but does not adequately describe it!

**E-commerce:** Compared to the murky definitions of e-business, e-commerce is clearer. In its basic form, it involves placing orders online and making payments online. Especially in the B2C (business to consumer) type of e-commerce, we have a website that sells goods on one end, and a buyer of those goods on the other.

**Is Business to Business Ecommerce the Same as E-business?** I have not seen this issue being addressed elsewhere, but I think that it is at the heart of the e-business vs. e-commerce dilemma. If you read about business to business (B2B) e-commerce, you will invariably come across references to

sharing data, supply chain management, logistics management and other core business processes that are not directly related to buying and selling. So which is it then: B2B e-commerce or e-business? In my analysis, people who can clearly differentiate between e-business and e-commerce are only thinking about B2C e-commerce. And those who find e-commerce and e-business to be synonyms are thinking about all forms of e-commerce, including B2B e-commerce.

**The Development of E-Business:** Think of all the types of businesses in a normal economy. You have retailers that sell directly to the consumer. You have wholesalers who sell to retailers. You have manufacturers who sell to the wholesalers. You have service providers that sell services to help the rest of the economy work. Throughout the 1990s and 2000s, all of those businesses found ways to use the Internet to be more productive, thus, in some way, becoming e-businesses. Soon, the term 'e-commerce' was in use, still referring to e-business activities but often being more focused on the buying or selling transactions. Distance shopping company JD Williams has made such a success of its Internet sales channel that it has now set up a company so it can market its expertise to other retailers. Zendor is a joint venture between JD Williams' parent company, N Brown, and GE Capital, which is now generating an extra income for the group by marketing JD Williams' expertise in e-business strategy, marketing and fulfilment services. Not bad going for a company that only launched its first website in February 1999! Tom Fothergill is e-business director at Eunite, the e-commerce design and development arm of Zendor, and the man who managed JD Williams' early forays in selling online. "We recognised back then that as a distance shopping player, e-commerce was a logical extension of our business. We recognised the value of being a multi-channel business before it became a trendy term," he says. The company ran a low-cost trial site until September 1999, based on a Windows NT platform. The next six months saw JD Williams completely revamp the infrastructure behind its website as it looked to create a fully-functional site that could provide new services like live online credit checking, stock availability and targeted marketing. Fothergill and his team decided to use Java-based technology and used IBM's WebSphere software to integrate the website with JD Williams' IBM mainframe based back-office systems. The company had no need of external consultants to help develop its online strategies, which were really just an extension of its own multi-channel business - as Fothergill explains. "Like online retailing, distance shopping is a fine art - it is about having good content and managing information across multi-channels JD Williams already deals with its customers via its direct sales force, stores and its telephone and catalogue services], something we had been doing for 20 years. When we went to see consultants, we were lecturing them and they were taking notes," he says.

**Conclusion:** Every day, new competitors rise up as weaker companies run out of steam and fall off the map. Industries, especially e-commerce, are constantly churning, with new businesses opening up shop, and older, failed businesses disappearing into obscurity. Despite the volatility of the industry, e-commerce continues to grow.

## THE EMERGED RETAIL INDUSTRY OF INDIA

**Prof.Shinde V.G**

*Asst.Professor, Arts, Commerce and Science College, Satral, Tal.Rahuri, Dist.Ahmednagar*

**1.1 Introduction:** The Indian retail industry has emerged as one of the most dynamic and fast-paced industries due to the entry of several new players. It accounts for over 10 per cent of the country's Gross Domestic Product (GDP) and around 8 per cent of the employment. India is the world's fifth-largest global destination in the retail space. Indian Retail Industry has immense potential as India has the second largest population with affluent middle class, rapid urbanisation and solid growth of internet.

**1.2 Market Size:** India's retail market is expected to grow at a Compound Annual Growth Rate (CAGR) of 10 per cent to US\$ 1.6 trillion by 2026 from US\$ 641 billion in 2016. While the overall retail market is expected to grow at 12 per cent per annum, modern trade would expand twice as fast at 20 per cent per annum and traditional trade at 10 per cent#. Indian retail market is divided into "Organised Retail Market" which is valued at \$60 billion which is only 9 per cent of the total sector and "Unorganised Retail Market constitutes the rest 91 per cent of the sector. India's Business to Business (B2B) e-commerce market is expected to reach US\$ 700 billion by 2020. Online retail is expected to be at par with the physical stores in the next five years. India's total potential of Business to Consumer (B2C) is estimated to be US\$ 26 billion, of which \$3 billion can be achieved in the next three years from 16 product categories, according to a study by Federation of Indian Chambers of Commerce and Industry (FICCI) and Indian Institute of Foreign Trade (IIFT). India has replaced China as the most promising markets for retail expansion, supported by expanding economy, coupled with booming consumption rates, urbanizing population and growing middle class. India is expected to become the world's fastest growing e-commerce market, driven by robust investment in the sector and rapid increase in the number of internet users. Various agencies have high expectations about growth of Indian e-commerce markets. Indian e-commerce sales are expected to reach US\$ 120 billion! by 2020 from US\$ 30 billion in FY2016. Further, India's e-commerce market is expected to reach US\$ 220 billion in terms of gross merchandise value (GMV) and 530 million shoppers by 2025, led by faster speeds on reliable telecom networks, faster adoption of online services and better variety as well as convenience. India's direct selling industry is expected to reach a size of Rs 23,654 crore (US\$ 3.54 billion) by FY2019-20, as per a joint report by India Direct Selling Association (IDSA) and PHD. Indian exports of locally made retail and lifestyle products grew at a CAGR of 10 per cent from 2013 to 2016.\*The size of modern retail in India is expected to double to Rs 171,800 crore (US\$ 25.7 billion) from Rs 87,100 crore (US\$ 13 billion) in three years driven by omni-channel retail.

**1.3 Investment Scenario:** The Indian retail trading has received Foreign Direct Investment (FDI) equity inflows totalling US\$1.04 billion during April 2000–June 2017, according to the Department of Industrial Policies and Promotion (DIPP). With the rising need for consumer goods in different sectors including consumer electronics and home appliances, many companies have invested in the Indian retail space in the past few months.

- US-based footwear company, Skechers, is planning to add 400-500 more exclusive outlets in India over the next five years and also to launch its apparel and accessories collection, as it increases its operations in India.

- Paytm Ecommerce Pvt is planning its first major sale on the Paytm mall for the upcoming festive season and will invest Rs 1,000 crore (US\$ 156.14 million) for promotion, cash backs, and marketing.
- Investments by private equity firms in Indian retail sector reached US\$ 200 million in the first half of 2017, with seven new global brands entering India during the period.
- Japanese low-cost retail chain, Miniso, opened its first store in India in August 2017 and is targeting revenue of Rs 10,000 crore (US\$ 1.56 billion) over two years by reaching a count of 210 stores by the end of 2018 and 800 by 2019.
- IKEA, the Netherlands-based furniture company, has purchased 14 acres of land in Bengaluru for setting up its third retail outlet in the country.
- Future Group, a consumer goods company in India has entered into a joint venture with Khimji Ramdas Group in UAE for selling garments in Oman with both the companies having invested US\$ 11.7 million each. The joint venture will first launch four to five stores in Oman and gradually increase the count to 17 to 18.
- Amazon India plans to double its storage capacity in India by adding 14 new warehouses by June 2017, aimed at maintaining rapid growth in sales and catering to the remote parts of India.
- Bang and Olufsen, Danish stereo and speaker system maker, has plans of setting up about eight to ten standalone satellite stores by the end of FY 2017-18 in cities like Kolkata, Hyderabad, Ahmedabad, among others.
- Walmart, global retail giant, plans to open 50 new cash-and-carry stores in India over the next three to four years and locate half of the stores in Uttar Pradesh and Uttarakhand while creating over 40,000 jobs in the two states.
- Global e-commerce giant, Amazon is planning to enter the Indian food retailing sector by investing US\$ 515 million in the next five years, as per Mr Harsimrat Kaur Badal, Minister of Food Processing Industries, Government of India.
- US apparel retail major Gap Inc, has tied up with Arvind Group's fashion portal NNNow.com to sell its products online, which will help the retailer expand its presence beyond metros and tier-I cities.
- Hamleys, has stated that India is one of the most important markets for Hamleys globally, and outlined plans of opening six more stores, taking its total store count in the country to 32 by the end of March 2017.
- Roche Bobois Group, outlined plans of opening new stores in cities like Hyderabad, Chennai, Pune, Kolkata and Ahmedabad, in order to make India one of its top five markets by 2022.
- A joint venture between Dutch asset manager APG Asset Management and real estate asset platform Virtuous Retail, has acquired a portfolio of three shopping malls for US\$ 300 million, and has committed an additional US\$ 150 million as equity capital to expand the portfolio.
- Future Consumer Ltd has formed a joint venture (JV) with UK's largest wholesaler, Booker Group, with an investment of Rs 50 crore (US\$ 7.5 million), to set up 60-70 cash-and-carry stores in India in the next 3-4 years.
- Adidas India Private Limited, outlined plans of opening around 30-40 big flagship stores across Delhi, Mumbai and Bengaluru, by 2020.
- Mad Over Donuts (MoD), outlined plans of expanding its operations in India by opening nine new MOD stores in Hyderabad and Chennai by March 2017.

- Switzerland's luxury retail brand Bally, plans to re-enter the Indian market in a joint venture with Reliance Brands Ltd, by opening its first store in New Delhi in March 2017, and thereafter aiming to expand to four stores in Delhi, Mumbai, Kolkata and Chennai over the next 3 to 4 years.
- Urban Ladder, an online furniture store, is in advanced talks to raise around US\$ 25-30 million from existing investors Kalaari Capital, SAIF Partners and Sequoia Capital, along with one new investor, which will be used to fund its expansion plans.
- Hennes & Mauritz (H&M), the Sweden-based clothing retailer, is in advanced talks with Mumbai-based Prakhhyat Infraprojects Pvt Ltd to lease around 275,000 square feet of space at Bhiwandi, Maharashtra, to set up its first warehousing hub in India.
- Future Group has partnered with UK clothing and hardware retailer Laura Ashley to make and sell merchandise as well as wholesale distribution in India.
- Parle Agro Pvt Ltd is launching Frooti Fizz, a succession of the original Mango Frooti, which will be retailed across 1.2 million outlets in the country as it targets increasing its annual revenue from Rs 2,800 crore (US\$ 0.42 billion) to Rs 5,000 crore (US\$ 0.75 billion) by 2018.

**1.4 Government Initiatives:** The Government of India has taken various initiatives to improve the retail industry in India.

- The Government of India may change the Foreign Direct Investment (FDI) rules in food processing, in a bid to permit e-commerce companies and foreign retailers to sell Made in India consumer products.
- Government of India has allowed 100 per cent Foreign Direct Investment (FDI) in online retail of goods and services through the automatic route, thereby providing clarity on the existing businesses of e-commerce companies operating in India.

**1.5 Conclusion:** Indian Retail Industry has immense potential as India has the second largest population with affluent middle class, rapid urbanisation and solid growth of internet.

**THE STUDY OF INDIAN ECONOMY ALONG WITH EMERGING STRATEGIES****Prof. Mahendra K Sonawane***College Of Computer Sciences, Wakad Pune-57***Abstract**

*India is one of the largest economies in the world, and perhaps, one of the most prominent emerging markets as well. Indian foreign policy is the most crucial determinant that set the tone of the future milestones this paper examines the current state of India in terms of strategy, mindset and its implications on economy and other determinants that impede growth. It also looks at the success stories along with plausible strategy for sustaining growth... One major concern that might hamper the growth is the competitive strategy and hostile relations with neighbors, which is deemed as the biggest impediment for India to become an economic power house. This research paper includes the successful models of China, Germany and Japan and how they established their economies by collaboration with their respective regions or neighbors. This indicates a crucial point to ponder for India, which sturdily develops a collaborative strategy with neighborhood in order to help its growth and become an economic power house of the world.*

**Keywords:** - India, China, Germany, Japan, neighborhood, economic development

**Introduction:**-India, the third largest economy (as per ppp), and with a population of 1.2 billion, has median age of approximately 25 years and ample natural resources, including agricultural land, oil and gas. With GDP of 1.8 trillion (USD), it's perhaps one of the most prominent and emerging markets of the world, not to forget the ancient enriched culture. As far as its economic structure is concerned, 18% of GDP is driven by agriculture, 15% manufacturing and a whopping 55% from service sector. It ranks in the 8th spot in defense spending with \$38.3 billion; on education it spends almost 4.2 % of the GDP. India is being inflicted with pressing problems as well, daunted by the growing population which will supersede China in 2050, if it continues to increase at the same rate as current. India has been blessed with some of the finest agricultural land, natural resources and is leaping forward in production, having a substantial foothold in markets such as tea, sugar, cereal, wheat, rice, pulse and livestock. If we look at the industrial sector, which had a growth rate 7.5 percent (2010), textile remains ahead in terms of employment opportunities followed by automobile, pharmaceutical and IT. All of these sectors are key arbiters for India in making a lasting economic impact and setting the stage to leverage other sectors. Service sector accounts for the major chunk of GDP, performing well over the past two decades with major determinants that extend from communication, hotel and tourism, transportation to trade, financial services and IT. Being competitive in IT has led to a rise in pay in that particular industry due to proficient, skilled labor available, something that is not as common in other parts of the world. The latest breeze of FDI came in terms of outsourcing, thanks to the skilled workforce. Outsourcing of business is not merely from manufacturing point of view but also in information technology. India's skilled and proficient English speaking population has pulled the FDI in shape of business process outsourcing, software services and call centers. It is indeed true that emergence of India is highly leveraged by the skilled workforce.

**Problem statement:**-India is deemed to be in a decent state of economy, amid the circumstances but in order to become an economic powerhouse India need to re-evaluate the current state from a different lens that stretches from economic development to cordial relationships with countries sharing borders. Current state is based on competitive policy among other countries and having tense relationships, specifically with the neighboring countries. Competitive policy could be the biggest impediment and it's swaying India away from becoming an economic power. Probably, where it needs to be in order to take off to become the economic powerhouse has stark difference in dimension all together comparatively from the current state, which is rigid and inflexible up to a large extent. It is deterring the country from

its potential goal. The ideal position will indeed stem from the basic policy which needs to be revised, and attuned to the ideal state. The ideal state trickles down to a single principal, which is to be collaborative with the rest of the world - specially, the need to focus on developing collaborative and genial relationship with countries sharing borders in order to spur economic development in the region.

**Research objectives:-**The research objective of this study is to determine the current state of India in terms of economy, factors that impede success, and possible sound strategy for new growth for India. These are stated here as points:

- Primarily, the purpose of this research is to comprehend the current state of Indian economy along with the economic strategies being implemented.
- To understand the foreign policy related to the neighboring countries and the nature of relationships among other countries.
- To identify the factors that resist India from becoming an economic power.
- To review the factors that have alleviated countries like China, Japan and Germany, and how they improvised in all disciplines.
- To perceive how those strategic success factors can be replicated in India
- To devise a sound theme for strategies that could assist strong growth, as well as aid the country to become an economic power.

**Significance:-**Becoming an economic power has a lot of affluent prospects for the nation; one of the most significant pros is related to the say in international politics, by default, the share of voice will increase as the dependency of the world is likely to increase if India becomes an economic power house. Moreover, issues over which it has to reiterate its stance will no longer be required. For instance, the relationship of India and Iran is often surrounded by fear fog due to the pressure and stress from USA embargo over Iran. This and a lot of other issues will no longer require enlightening and perpetual explanations from New Delhi. Further implications of economic supremacy also comprise robust development in infrastructure, in terms of energy oriented projects, plummeting poverty, rising literacy rate, development of human capital and technology embedded infrastructure, making almost every field competitive or up to the prime standard. FDI often entails technology transfers after becoming the prime option for multinationals; it would be a prodigious chance for India to do some reforms that enable the technology transfer, allowing the labor and infrastructure to become even more competitive

India is becoming densely populous with every passing day and demographers speculate that the population of India will supersede China in 2030 with projected population by of 1.53 billion while China at that time is anticipated to have around 1.46 billion. This means government will be strained, needing to create jobs to fulfill the vacuum. Therefore becoming the economic epicenter will underpin the economic activities and job creation, it will also help India to escape from the dire strait if population kept on soaring while economic activity remains stagnant and would lessen the liability over government to create opportunities for natives. Another significant advantage is the transformations towards entrepreneurial spirit if we meticulously review the world's top economies; we will find that entrepreneurial spirit is touching peaks, whether in USA, Japan, or China, a prosperous, stable and skilled workforce enabled country spurs the entrepreneurial environment. After getting to the limelight, India will have the opportunity to provide a decent ground to carry out entrepreneurial ventures.

**Limitations:-**There are a plenty of pressing problems that could limit growth, preliminary the infrastructure, the economic development India needs depends on a much more demanding infrastructure to precede the activities. We can break it down further to develop a better premise, the energy sector of India seems to be handicapped, around 9 % of loss in manufacturing is caused by power outages annually whereas in China it is estimated around 2%. There is a stark difference between

both countries in terms of energy sector and its productivity to aid the manufacturing industry. Average Projected power outage in India is around 17 times a month whereas in China it is less than 5 times. 60% of manufacturing facilities in India carry out their activities over alternative energy sources while in china this figure is down to 27%. These statements could depict the loopholes that are required to be plugged; this inadequate energy sector will limit the growth and will also deter FDI. If we look at the transportation network, the picture is not quite dissimilar from the energy sector, airports are highly strained and capacity is less as compared to top economies. Mumbai and Delhi can handle 25 to 30 flights daily while this figure in Beijing is around 40 per day. The railway network is not up to the mark to sustain the high growth influx, earnest attempt to make it efficient and up to the mark is required. Transport network is considered to be a key arbiter in economic success of a country and when we talk about the economic power house then its importance is far more significant. Unfortunately, India currently lacks here which limits its economic growth. Perhaps it is true that India has gone on a roller coaster of economic growth in recent years, but the income inequality enlarged amid different states, Punjab, Tamil nadu, and few others relish higher income as compare to Rajasthan, Uttar Pardesh. This will create a dire economic imbalance in the coming years; investors will consider those parts where the labor is skilled and blessed with decent resources, while the already deprived areas will remain in the dark and will require more indulgence and devotion of decision makers to look after those areas, all parts of the country accumulates for the progress of economy, given plight will only result in a stagnant economy. In addition, massive debts and deficits encumbered the government even more and they were left with fewer budgets to devote towards the infrastructure, education and public sector development, which eventually ended up in a sluggish progress.

**Scope:-**The premise of this research is based on some of the core denominators of economy, initiating from GDP, which often determines the future prospects of a country and economic projections of a country comprises GDP. Infrastructure deemed to be a key arbiter in either robust growth or could well curb the progress, and it's a true catalyst in terms of economic growth. Infrastructure covered in this research includes power sector, transport sector, education and health. They all have intense affects over economy and are directly proportional to economic progress. Relations with other countries discern an economic power with the rest that is indeed one of the most influential principals in measuring growth, developing economy and, more importantly, sustaining that growth. This study specifically covers international relations with countries sharing borders. One of the strategic determinants that have obvious importance is the political stability and bureaucracy of the country, and both play a vital role in steering the economy and any fallacy can be dreadful. We are aware of the fact that India is mammoth in size, as are the hierarchy and bureaucracy of the country hence its implications on economy cannot be negated, this research covers this strategic determinant. A country and its progress are often measured from different parameters. Debt is one of them, a parameter that cannot be disavowed: it constrains the growth, inclination in debt means more GDP will be ascribed towards fulfillment hence leaving lesser for the development and amenities, research also covers the disparities among social classed and income both conditions have their own subsequent aftermaths. In a country like India where the class discrepancy is huge, such a factor is even more important. Laws, policies and decision makers are the pillars over which the structure of a country stands; this research covers the reforms taken to spur the economic progress and policies to make them effective in the long run. History shows that some countries grew significantly due to the economic reforms, laws and regulations. Therefore; this aspect has also been addressed in developing this research.

**Review of Literature:-**India is an emerging global economy. The views of Hogg (2007) has been expressed that when we glance at the potential of India, categorically, it has a substantial platform to

capitalize its resources and transfigure as an economic power house, but the road to success is highly reliant on relationships with its neighborhood, that will become the inflection point for any country looking to grow and progress. Current state of relationships is highly volatile; this will lead India to an untenable position in terms of growth and progress. There are many precedents in the world that patronage the fact that close ties with neighbors results in a lot of advantages. Notable are skilled labor, technology transfers, trade, and infrastructure amelioration and so on. These all dribble down to a simple principle called “collaboration”, looking for a win-win situation that would pave the way for any country to progress and more importantly to steer it towards the right direction, to sustain the economy along with the robust growth. Now comes the crucial part: according to Datta. S, Prashant Kumar Singh and Rumel Dahiya (2012), are the neighborhood and relationships with them. India, sharing border with the second largest economy, which has gone through skyrocketing growth and attracted majority investor to have an eye on opportunities underlying in China. While examining the relationship of India with China, one would clearly identify the relationship being contentious due to dominance in region and few other concerns that encompass territory issues and military dominance. Moreover, the mounting collaboration of China with Pakistan and Bangladesh has also led wariness and austerity amid China and India’s fragile relationship. The island state “Srilanka” and Asian titan India have assorted relationship, an ostensibly amicable relations is in fact had fraught India with issues that primarily were srilankan internal concerns but they do have impact over India. Influx of refugees used to be one big question that kept the countries away from each other. India has provided financial aid to the island and exerted pressure to sort out the matter with Tamil tigers, as long as the contention between srilankan government and Tamil tigers remain awake, the relationship of India and srilanka will remain suspicious. Indian parliament has been also skeptical about the financial aid given to srilanka for relocation and development hence the relationship is still dubious. Coming towards another country sharing border with India, “Bangladesh”, and the liberation of Bangladesh was dominated by Indian interventions back in 1971; however the relationship with Bangladesh is no different with its most of the neighbors, surrounded by fear fog and fraught with issues related to cross border militants and anti-Indian groups flourishing in Bangladesh that the Indian stance. Both countries in past came close of a lethal battle as well due to the extremist present on both sides, moreover the current state of this relation remains flimsy. There is a widespread believe and probably an overt reality that Pakistan and India are Archrivals, relationship with Pakistan doesn’t require much comprehension, apart from horrendous battles, the burning issues like Kashmir, the extremist groups present on both sides, are making the rift grow further. Indo-Pak relationship is perhaps the most capricious and perilous not only for both countries but even for the entire world as both countries are nuclear powers. According to Martin. M. F. and Vaughn. B (2011), Nepal, has a numerous reasons to be a close ally of India, being officially a Hindu state is one of them but even than the picture is not as pleasant as it should have been, concerns with Nepal extends from having a close tie or getting closer to china to maintaining political stability in Nepal as it has prominent affects over India. As far as Burma is concerned, which faced sanctions for suppressing the democracy, nothing can affect India more than the instability in Burma that could have grim outcomes for India, primarily the refugees and insurgency distresses the relationship, and however the dominance of china is also an apprehension for India, relationship with Burma has strategic importance for India specially in terms of dominance in the region. From above research, one of the key finding that can be easily extracted is the competing strategy, far away from being collaborative, in coming part; we will compare the successful models of economically sound countries with Indian model of foreign policy to set a premise for how can India become an economic power house, what should have been an important part of Indian foreign, specially the neighborhood policy.

**Successful models:-**

**3.1. China:-**According to Rosecrance, R, 2006, its development in 2011 was above 9%, and universal evaluations foresee China may be on track to turn into the planet's largest economy inside the following 5-10 years, with an interior market of 1.39 billion potential customers by the finish of 2015. China's ascent as a major worldwide economy was helped by its WTO participation in 2001, which made it change and open up its economy. This provided a stage for china to turn into the biggest exporter on the planet.

**3.1.1. China – Germany:-**Germany's geographical location in Europe makes it a great beginning place for china to launch itself all the more successfully into the European theater. At present, Germany sustains a substantial GDP and the biggest population of all the European Union nations. Verifiably Chinese and German relations have been portrayed as being uneven; however this has changed in the later years with Chinese associations expanding/buying/partnering with German associations. In sectors as differing as it, machine fabricating, medicinal innovations, and renewable energies Chinese associations are looking for chances to increase their educated/locally experienced laborers to get a decent footing in the European business. “A good example is China National Building Material Group Corporation (CNBM), a China based manufacturer of technologies for wind energy such as rotor blades required for windmills. This company in 2006 was looking to expand into the European market. It found its opportunity in NOI Rotortechnik GmbH, a German company with headquarters in the Eastern German state of Thuringia. The German company had fallen on financially hard times, but still enjoyed a reputation throughout Europe for making top-notch products for windmills. CNBM also saw the company's strength in R&D and Germany's position as the world's largest market for wind energy as major attractions. Moreover, 37% of worldwide wind turbine and component production comes from Germany.” Such examples display that Germany is increasingly becoming a place where Chinese investors are looking to expand into strong and wealthy markets, use the expertise of local experienced employees, and earn the trust of a “made in Germany” label. (Invest in Germany, 2008)

**3.1.2. China – Nepal:-**China seemed to be least concerned about Nepal until 1950's, but soon it realized the strategic importance and Nepal deemed to be in a tug of war amid the strategies of China and India, the two heavy weights of Asia as according to (Dr. Kumar. S, 2011). He further added that however, India has the upper hand in relationship with Nepal with the help of trade and open border policies. It has been troublesome to make exceptional relations with Nepal particularly when it's new prime minister needed to leave inside months to clear path for another leader. However china completely grasps the all aspects of Nepalese political scenario. China is increasingly interested in redeveloping investment and security relations with Nepal especially due to Tibet and expanding Indian impact in the nation.

**3.1.3. China-Pakistan:-**The Chinese Premier Wen Jiabao's visit to Pakistan in December 2010, the Pakistani Ambassador in Beijing, Masood Khan, stated in a statement that China was “the most favored country for Pakistanis”. Given the notions toward the Chinese, it is not astounding that 2011 was authoritatively named “the year of China-Pakistan Friendship” by both nations. The Pakistani media has added to the buildup about the profundity of the relationship, consistently proposing that China could soon trade the United States as Pakistan's best critical two-sided friend. This media edge is particularly clear when Pakistani-American relations are not going admirably, with 2011 having been an especially terrible year in that regard." It is difficult to check correctly what amount of help China gives to Pakistan this is for two explanations. To begin with, there is an absence of transparency in the Chinese Government's dispensing of help subsidizes. Second, appraisals of China's remote support, which comprises for the most part of level premium advances and government-upheld or sponsored

speculations in framework and common assets, shift considerably because of the diverse meanings of support. Just a generally little parcel of Chinese help incorporates what normally is described as "official advancement help" by the planet's major support givers, for example infrastructure awards, compassionate support. China has been providing Pakistan economic assistance in many forms mostly in the form of technical assistance in many projects as well as providing engineers. Chinese economic interests in Pakistan have grown over the past 6 decades of the relationship. China has keenly helped Pakistan develop its infrastructure to support trade. Currently China provides technical assistance in building dams, motorway, seaports, and other precedents includes JF-17 thunder project, F-22P frigate project.

**3.2. Germany:-**Germany undertook tough structural restructures to improve competitiveness after the creation of the lone currency in 1999, and the German economy became more and more dependent on trade goods – initially to the European boundary but progressively furthermore to Asia and above all china. Two-thirds of GDP growth in the past decade has been due to trade and today almost half of GDP comes from trade. In the decade since the creation of the euro, Germany's economy has become, as Simon Tilford has put it, "structurally reliant on foreign demand for its growth". Partly as an outcome of this structural change in the finances. German foreign principle is now furthermore progressively propelled by economic concerns and, above all, by the desires of exporters. The government Republic utilized financial rather than military means to achieve its foreign-policy goals and was therefore seen as a "civilian power". But before reunification, German foreign policy furthermore pursued political goals – above all, security and rehabilitation. With the end of the cold war conflict, although, the political constraints on Germany were lifted while globalization and the charges of German reunification have put the German finances under greater stress. As a result, German foreign principle has been progressively in pursuit of economic rather than political goals. Presently many hold the view that it is Germany which has stabilized the recession in EU or it would have been a lot worse.

**3.2.1. Germany – France:-** The relations between France and Germany is embodied in a cooperation called Franco-German companionship .This came about after 1945, when a French–German enmity between the two nations ended. Especially in the context of the European amalgamation, the cooperation between the nations comes to immense coordination and collaboration. Even though France has at times been euro skeptical in outlook, especially under President Charles de Gaulle, Franco-German affirmations and cooperation has always been a key to furthering the ideals of European integration. In recent times, France and Germany are amidst the most passionate proponents of the farther integration of the EU. They are occasionally described as the "twin motor" or "core countries" impelling for moves. Given the size of its market, its degree of openness and geographic proximity, Germany is France's premier trading colleague. In 2009, French exports to Germany stood at €55.2b (16%) and French trades from Germany stood at €71b (8.7%). France's bilateral deficit declined: going from €18.4b in 2008 to €15.8b in 2009. Germany is the fifth-leading foreign shareholder in France and in 2009 became the leading country of source in foreign investments and creators of jobs in France. France is the fourth leading foreign investor country in Germany. Today Germany and France are long way from the brutal enemies they once were. German and French cooperation in the EU has been of the greatest importance.

**3.2.2. Germany - Russia:-**Germany is the most significant EU constituent state in the eyes of Russia which views it as its most mighty advocate inside the EU. They share a long chronicled connection encompassing the two devastating conflicts of the 20th century. The influence of the Nazi strike on Russia in 1941, the horrendous casualties on the to the east Front, the Russian triumph over fascism (still celebrated on 9 May) and the Soviet occupation of East Germany for over 40 years, still have an

influence on the relationship. There have been several demonstrations of close individual connections at the highest level of government: Kohl/Yeltsin, Schroeder/Putin. The relationship between Merkel and Putin/Medvedev is, although, calmer. Germany enjoys powerful economic binds with Russia and is a biggest support inside the EU for closer relations with Russia. The Foreign Ministry has established an office for inter-societal collaboration while the Petersburg Dialogue facilitates associates between political leaders and high ranking players in business, culture, learning and the media. German businesses, including numerous little and medium-sized enterprises have nearly increase two-fold their business capacity in Russia every two years since 1998. In 2007, Germany was by far the biggest exporter to Russia with 32% of total EU trade goods to Russia, more than tripling from €6,660 million in 2000 to €28 billion in 2007. The identical is factual for trades, which increased from €14,263 in 2000 to €27.6 billion in 2007m accounting for 19% of total EU trades from Russia. The trade balance in 2007 was affirmative at €437 million for the first time since 2000. According to Rosstat data, Germany is the fifth biggest shareholder in Russia (7% of all foreign investments in Russia). Germany is also the fifth large-scale receiver of investments from Russia (4% of the total). The fastest growing parts for German investment are IT, communication technologies and high-tech commerce. Many organizations promote nearer financial and trade binds such as the influential Ost-Ausschuss der Deutschen Wirtschaft. Germany was Russia's major creditor in the Paris association retaining more than 40% of Russian credits. Germany is Russia's large-scale energy-customer of Russia within the EU, taking 34% of its oil and 42% of its gas from the homeland. Germany imported 36,915 thousand tons of oil and 1,477,669 t-j-cv of gas from Russia in 2006. This close collaboration, and furthermore high dependence, has a long custom and is echoed in the creation of numerous joint ventures such as the contentious Nordstrom pipeline.

**3.3. Japan:-**According to Hiroko (2005), it is said ever since World War 2 Japan has formulated its foreign policy to primarily defend its home land. Its foreign policy largely depends on its relations with the US, but due to recent economic woes and loss of influence in Asia Japan is forced to review its foreign policy after many decades. Japan has maintained a policy of non-aggression for more than 60 years. Its policy of not imposing its will by force but rather change itself according to recent events, this sometime is referred as "trends of the time" has helped Japan become a world economic power in a very short time.

**3.3.1. India–Japan relation:-**India and Japan have always had strong relations. Japan has been very keen in deepening its bonds with India ever since its independence. In fact India is the largest recipient of development aid from Japan. Japanese companies were one of the first ones to invest in India. Japan and India have steadily grown their trade over the years.

**3.3.2. Japan – China:-** Japanese and Chinese relations go back centuries. Both countries have been at odds with each other over different issues for decades; however trade between both countries has not stopped but rather has grown.

**Conclusion:-**A considerable amount of research is done on conflicts amid countries which back the assertion that having relationships that are incessantly in state of flux can be perilous for GDP, foreign direct investment and even for domestic investment as well. Regardless of the magnitude of the conflict, minor or major, it has its repercussions amidst countries and in region as well. Indian foreign policy will be the most crucial determinant that will set the tone for the future milestones; imprudence here would mean unenviable results, and a perpetual downward spiral. So, the foreign policy has to be well thought off, discreet and diligently applied after culminating the theme. In retrospect, the span of middle 1980's to 1990's is denoted as lost decade, when India was fuming with religious intolerance and turmoil. Most of the opportunities went ashes due those dire straits. Than the IT boom followed by

private sector headway, helped the dwindling Indian economy to find a foothold. Shackled with constraints, in fact a lot dire internal concerns are hampering the Indian economy, not to forget the 300 million Indian living below the poverty line, latent talent yet to be utilized, living a precarious life. So it's becoming quite reminiscent in terms of wage rate with Chinese model, where you see the urban going through technology ridden period and deprived rural away from globalization. It is just one impediment; one more road block is the health related issues, one of the pressing problems of India; appalling number of HIV infected population, poor health facilities in rural could will make progress dawdling. Infrastructure, Social justice, religious ferment are other detrimental factors that require deepen focus of Indian think tank in order to devise a plan of how to disentangle from pressing and fuming internal concerns. It's a fact that millions of Indian are living under poverty line with miserable conditions, decrepit roads and dilapidated towns reveal the rest of the story but yet the country is blessed with great potential, it has a decent workforce along with an infrastructure that can ameliorate to excel its economy, it has sea ports, air ports, railway and road network albeit not a benchmark infrastructure but enough to back the FDI and this system can be enhanced subsequently. One major concern probably that will hamper their growth and economy is the competitive strategy with neighbors, which will be the biggest impediment for India to become an economic power house. We have discussed the successful models of countries which thrived and established their economies by collaboration with neighborhood, and probably it's a key arbiter to economic success, china is grabbing the foreign direct investments and enjoying amicable relations with neighborhood, Japan has also followed more or less the same track and as far as Germany is concerned it's the heart of production in Europe and has collaborative approach particularly for neighbors. This all indicate a point to ponder for India which sturdily patronage the collaborative strategy with neighbors to alleviate its economy to become an economic power house of the world.

**ROLE OF FOREIGN DIRECT INVESTMENT IN INDIA****Dr. Naikwade Abhijit C.**

Superintendent, K. J. Somaiya College, Kopergaon.

**Abstract**

International Economic Integration plays a vital role in Economic Development of any country. Foreign Direct Investment is one and only major instrument of attracting International Economic Integration in any economy. It serves as a link between investment and saving. Many developing countries like India, are facing the deficit of savings. This problem can be solved with the help of Foreign Direct Investment. Foreign investment helps in reducing the defect of BOP. The flow of foreign investment is a profit making industry like insurance, real estate and business services and serving as a catalyst for the growth of economy in India. The present study is based on the objectives like (a) to know the requirement of amount of foreign investment by India, for its economic Development and (b) to analyze the trend and role of FDI & FIIs in improving the quality and availability of goods has been beyond doubt. To analyze all these objectives data has been gathered through secondary sources like reports and publication of Govt. and RBI relating to foreign Investment. After analyzing all the facts it may be concluded that maximum global foreign investment's flows are attracted by the developed countries rather than developing and under developing countries. Foreign investment flows are supplementing the scarce domestic investments in developing countries particularly in India. Further this paper recommends that we should welcome the inflow of foreign investment because it enable us to achieve our cherished goal like making favorable the balance of payment, rapid economic development, removal of poverty, and internal personal disparity in the development and also it is very much convenient and favorable for Indian economy.

**Introduction :** Foreign investment plays a significant role in development of any economy as like India. Many countries provide many incentives for attracting the foreign direct investment (FDI). Need of FDI depends on saving and investment rate in any country. Foreign Direct investment act as a bridge to fulfill the gap between investment and saving. In the process of economic development foreign capital helps to cover the domestic saving constraint and provide access to the superior technology that promote efficiency and productivity of the existing production capacity and generate new production opportunity.

**Objectives of Study**

- To understand the need for FDI in India.
- To rank the sectors based upon highest FDI inflows.
- PROBLEMS FOR LOW FDI FLOW TO INDIA
- Pattern of FDI (Industry wise)

**Research Methodology :** The present study is based on the objectives like how much amount of foreign investment is required for India's economic growth and to analysis the trend of FDI & FIIs for economic development and how the status of economy has improved after economic reforms. To fulfill all above said objectives data has been gathered from secondary sources like reports and publication of Govt. and RBI relating to foreign Investment, economic journals, books, magazines and internet etc.

**Non-Banking Financial Companies (NBFC):** 49% FDI is allowed from all sources on the automatic route subject to guidelines issued from RBI from time to time.

**FDI in Insurance sector in India:** FDI up to 26% in the Insurance sector is allowed on the automatic route subject to obtaining license from Insurance Regulatory & Development Authority (IRDA)

**FDI in Telecommunication sector:** In basic, cellular, value added services and global mobile personal communications by satellite, FDI is limited to 49% subject to licensing and security requirements and adherence by the companies (who are investing and the companies in which investment is being made) to the license conditions for foreign equity cap and lock-in period for transfer and addition of equity and other license provisions.

**Problems for low FDI flow to INDIA:-** India, the largest democratic country with the second largest population in the world, with rule of law and a highly educated English speaking work force, the country is considered as a safe haven for foreign investors. Yet, India seems to be suffering from a host of self-imposed restrictions and problems regarding opening its markets completely too global investors by implementing full scale economic reforms. Some of the major impediments for India's poor performance in the area of FDI are: political instability, poor infrastructure, confusing tax and tariff policies, Draconian labour laws, well entrenched corruption and governmental regulations

**1. Lack of adequate infrastructure:** It is cited as a major hurdle for FDI inflows into India. This bottleneck in the form of poor infrastructure discourages foreign investors in investing in India. India's age old and biggest infrastructure problem is the supply of electricity. Power cuts are considered as a common problem and many industries are forced to close their business.

**2. Stringent labor laws:** Large firms in India are not allowed to retrench or layoff any workers, or close down the unit without the permission of the state government. These laws protect the workers and thwart legitimate attempts to restructure business. To retrench unnecessary workers, firms require approval from both employees and state governments-approval that is rarely given. Further, Trade Unions extort huge sums from companies through over-generous voluntary retirement schemes.

**3. Corruption:** Corruption is found in nearly every public service, from defense to distribution of subsidized food to the poor people, to the generation and transmission of electric power. The combination of legal hurdles, lack of institutional reforms, bureaucratic decision-making and the allegations of corruption at the top have turned foreign investors away from India.

**4. Lack of decision making authority with the state governments:** The reform process of liberalizing the economy is concentrated mainly in the Centre and the State Governments are not given much power. In most key infrastructure areas, the central government remains in control. Brazil, China, and Russia are examples where regional governments take the lead in pushing reforms and prompting further actions by the central government.

**5) Unexplored markets:** In India there is large scope for the investors because there is a large section of markets have not explored or unutilized. In India there is enormous potential customer market with large middle class income group who would be target group for new markets. Example: BPO was one sector where the investors had large scope exploring the markets where the service was provided with just a call, with almost customer satisfaction.

**6) Availability of natural resources:** As we that India has large volume of natural resources such as coal, iron ore, Natural gas etc. If natural resources are available they can be used in production process or for extraction of mines by the foreign investors.

**Pattern of FDI (Industry wise)** Only quantity of FDI is not important but it is more important that where this amount is invested. If FDI is coming in heavy industry, Basic capital Goods industry, infrastructure Development, Agriculture Development etc, certainly it will be fruitful and would increase the growth and production of Indian economy. If it will be invested in the more profit making non-priority industries such as luxurious, semi-luxuries industries i.e. A.C, T.V. Refrigerator, cosmetics etc. there will be increase in the consumption rate only and not in the capital formation in Indian economy. In this context, we would like to analyse the pattern of FDI inflow in the Indian economy in the following paragraphs. The data pertaining to the above discussion is given in table no 10. During the period 2002-11 highest amount of FDI went to financing sector and Insurance sector. Real estate, Business services and manufacturing got the second place in same period. The third important sector which attracted next highest amount of FDI was computer services industry and construction industry that held the 4th place and services sector held the 5th place in same period. While investment through

FDI came lowest in research & service (0.07%), education (0.61%), mine (0.23%), Health and Medical (0.83%) etc in above said period. On the base of above discussion it is clear that most of the FDI has gone to non-priority sector. Because FDI depends on profitability, industrial policy, customs, rates, FERA, regulations etc. But in case of India inflow of FDI is not satisfactory for the point of view of objectives of development of industries.

**Findings of the Study:** - On the basis of present study the findings are:

- The study reveals that the saving rate is less than investment rate in the study period.
- The foreign investment increased in both term i.e. FDI and FIIs.
- The FDI has better performance that attracts the 58.29 percent amount of total foreign investment inflow.
- Equity is the important route of FDI inflow that is 50289.96 billion dollar in India.
- Second important route of foreign indirect investment is FIIs. Through this route inflow of foreign investment found 56800 billion Dollars (US Dollar).
- The highest amount 6878 billion dollars of FDI in India came from Mauritius which is 42.76 percent of total cumulative FDI in study period while USA has 2nd and UK has 5th place.
- The highest amount of FDI has gone to financing, Insurance, Real Estate and Business services which are 33.05 percent and minimum went to research & scientific services which is 0.07 percent of total cumulative inflow of FDI study period in India.

**Conclusion & Recommendation:** On the basis of study we draw conclusion that maximum global foreign investment's flows are attracted by the developed countries rather than developing and under developing countries. Foreign investment flows are supplementing the scare domestic investments in developing countries particularly in India. But foreign investor never adopts environment friendly technique to maximize their profit. These investments met the financial requirement for building up the basic and essential infrastructure industries of priority sector. But we finds that the highest amount of FDI gone to financing sector, insurance sector, Real estate and Business services which is 33.05 percent of total cumulative inflow of FDI in study period in India. It's a serious matter in context of foreign direct investment objectives. Main reason of this sifting is high risk and low profit in concern sectors. Because the FDI are associated with various types of risks which are expected to provide various linkages in the development of Indian economy. But there is an upward trend in the flows of foreign investment particularly in study period. We should provide the better environment for attracting the foreign investment through direct as well as indirect methods. We should welcome inflow of foreign investment in such way that it should be convenient and favorable for Indian economy and enable us to achieve our cherished goal like rapid economic development, removal of poverty, internal personal disparity in the development and making our Balance of Payment favorable

**CONTRIBUTION OF AGRICULTURE FORMS IN AN INDIAN ECONOMY-[2013-15]****Dr. Kashide Ramesh Tukaram***Assistant Professor, Dept of Economics, A.W.College, Otur Tal-Junnar Dist-Pune*

**Introduction:** Agriculture sector is a backbone of the Indian economy. Agriculture is source of subsistence for more than 70% of peoples in the rural areas. It precipitance around 17.5% to the total G.D.P. of India .And agriculture sector is also the largest employer contributing 49% of the total labour force. A part from employment, agriculture also plays an important role in food security. However the growth rate of the agriculture sector in India has been changing. The growth rate of the agriculture in India mainly depends on the rainfall as majority of the cultivated area in India depends on rainfall. With the introduction of green revolution the agriculture sector experienced forceful growth rate during late 2013s' to early 2015s'. India is the world's largest producer of pulses, rice, wheat, spices and spice products. India has many areas to choose for business such as dairy, meat, poultry, fisheries and food grains etc. Introduction of green revolution and availability of technology has helped to increase total production of major crops in India.However lack of irrigation facility and inefficient government policies, lack of effective policy for the minimum support price, Lack of boost the productivity, Lack of welfare of the small and marginalized farmers should also be taken into consideration.

**Keywords-***Agriculture Development, Agriculture Problem, Agriculture Productivity, Agriculture Growth, Green Revolution.*

**Role of Agriculture in an Indian economy** The agriculture sector is the backbone of an economy which supplies the basic factor to mankind and now raw material for industrialization. Therefore the role of agriculture for the development of an economy may be stereo typed as below:Increase in agricultural production and the rise in the per-capita income of the rural community, together with the industrialization and urbanization. In this way, agricultural sector helps promote economic growth by securing as a addendum to industrial sector.

1. Contribution to National Income
2. Source of Food Supply
3. Agricultural Products
4. Pre-Requisite for Raw Material
5. Shift of Manpower
6. Creation of Infrastructure
7. Relief from Shortage of Capital
8. Helpful to Reduce Inequality
9. Based on Democratic Notions
10. Create Effective Demand
11. Helpful in Phasing out Economic Depression
12. Source of Foreign Exchange for the Country
13. Contribution to Capital Formation
14. Employment Opportunities for Rural People
15. Improving Rural Welfare
16. Extension of Market for Industrial Output.
17. Source of Livelihood

18. Role of Agriculture for Industrial Development

19. Commercial Importance 20. Source of Government Revenue

21. Role of Agriculture in Economic Planning

**Contribution of Agricultural In GDP** This is a good symptom for the Indian economy from the agriculture sector. Agriculture is an important sector of the Indian economy. Contribution of agriculture and allied sectors was 30.01% percent of DGP of the country in 2013-14. The percentage share of agriculture and allied sector in GDP declined to 17.5% percentage in 2015-16. Though the agriculture has been the mainstay of the Indian economy. The table given below shows that percentage share of agricultural exports was about 32.02 % percent of the total in 2013-14-.value of agricultural exports was 18.6% percent of the total exports in 2015-16.

**Contribution of Agriculture in GDP**

Source:

Year	Agricultural exports	% share of agricultural and allied sector in DGP produce
2013-14	32.0	30.01
2014-15	16.8	15.9
2015-16	18.6	17.5

Sources: Agriculture Census 2016-17.

**Current Problem and challenges of agriculture sector in India** Agricultural growth in India over the past sixty seven year has been pointed out by sure features which needs close attention among the more important of these are. The major challenges faced by the agriculture sector in India include Soil attrition, adverse weather conditions, floods, pest captivate, water, logging, salinity, denudation of forests and over populations problem to agriculture. However lack of irrigation facility and incompetent government policies has led to peace in the sector. The process of structural modification has also been quite slow. Still majority of the cultivated area is dependent on the yearly rainfall. There has been increasing case of crop failure and farmer suicide in the recent years. Also majority of the rural population who are dependent on agriculture have small land holdings where the marginal productivity of each member is close to zero. There should be strong policies to boost the productivity of the agricultural sector. However the effectiveness of the scheme can only be analyzed after its complement.

1. Seeds
2. Manures, fertilizers and biocide
3. Irrigation
4. Lack of mechanization
5. Soil erosion
6. Agricultural marketing
7. Inadequate storage facilities
8. Inadequate transport
9. Cropping pattern
10. Land ownership
11. Sub-division of holding
12. Land Tenure
13. Conditions of agricultural labour
14. Neglect of crop rotation

15. Inadequate use of fertilizers
16. The use of poor quality seeds
17. Inadequate water supply
18. Inadequate use of efficient farm equipment

**Conclusion:** Most of the peoples are directly or indirectly dependent on the agriculture sector. Some are directly attached with the farming and some other people are complex in doing business with these goods. India has the capacity to produce the food grains which can make vast difference in Indian Economy. To achieve targeted mark by the government it needs to provide support in case of land, bank loans and other machineries to the small farmers along with the big farmers with this we can expect some improvement in Indian economy. Agricultural progress is insuperable to provide food for growing non-agricultural labour force, raw materials for industrial production and saving and tax revenue to support development of the rest of the economy, to earn foreign exchange and to provide a growing market for domestic manufactures.

**IMPACTS AND CHALLENGES OF GST IN INDIA****Prof. Vinayak Pawar**

MES. Garware College of Commerce

**Abstract**

Goods and Services tax is a historic tax Reform in indirect tax system of India. Always tax play very important role in every economy. since last many years discussion on GST going on in India but finally it will come in to force from 1 July 2017. The aim of GST application is to reduce complex in Indian indirect tax system and provide them suitable system of tax. In India we have various types of central state and local government taxes so India want to make one nation one tax system. Goods and Services tax is beneficieate for industry government and consumers also as well as because of GST the cost of production will be lower that's why Indian product can capture world market. And they can compete with Global products. So GST is expected to make an India a common market with common tax rates and produces and Remove economic barriers. That is benefisher for improve business of India. So GST may be defined as a tax on goods and services which are leviable at earn point of supply. In which at a time of sale of goods or providing the services the seller or service provider may claim the input credit of tax which he has paid while purchasing the goods. As compare to existing tax system GST is always benefisher because the GST tax rate is lower than existing tax rates. Thats why common man gate benefited.

**Introduction :** The GST has been already introduce in nearly 160 countries and France was the first to introduce GST in the year 1954 in views of numerous benefits GST brings in to the economy introduction of GST has been on the political agenda of the country for quite some time. The journey to introduction in India has been long and is a culmination of the efforts of many political leaders, economic thinker and officers of the center and state government. The idea was GST first introduced in the year 2000 during the prime minister of Shri. Atal Bihari Vajpayee and a committee was setup headed by the west Bengal finance minister Shri. Asim Das Gupta to design a GST modal. In 2003 Vajpayee Government setup another task force under Shri. Vijay Kelkar to recommended tax reforms on February 28<sup>th</sup> 2006. the union finance minister in his budget fir 2006-2007 propose that GST would be introduced from April 1<sup>st</sup> 2010. the empowered committee of state finance minister which had formulated a design of state VAT was requested to come up with road map and structure for the GST. Joined working group of officials having representative of the state as well as center were set up to examine various aspect of GST and draw up report specially on exemption and there should taxation of service and taxation of interstate supply. An introduction of GST required constitutional amendment political consensus could not be garnered for a long time the constitutions 122 amendment bill 2014 was introduced in loksabha on dec 19 2014 and passed by loksabha in may 2015.

**Objectives of study**

- 1) To understand structure of GST
- 2) To understand Features of GST
- 3) To study the impact of GST on various sector of economy
- 4) To study challenges of GST in India

**Research Methodology:** For this current research paper researcher is used secondary methods for data collection means all information researchers are collect from various books magazine and online sources of information.

**II. Main features of GST**

- 1) GST is applicable on supply of goods and services.
- 2) GST is a single tax system means GST is whole of the country including the state of Jammu & Kashmir.
- 3) There are four tax slabs namely 5% 12% 18% and 28% for all goods and services.

- 4) Import of Goods is treated as inter-state supplies and would be sub deducted to IGST in additions to the applicable custom duties.
- 5) GST collars the entire production of Goods and Services except Alcohol and fire petroleum products (Crude, Petrol, Diesel, Natural Gas or out of GST).
- 6) Zero rating of exports and interstate sales of Goods and Supply of services.
- 7) No Scope for multiple levy of tax on Goods and Services. Such as, Sales tax, entry tax, luxury tax etc.
- 8) A common law and procedures entire the country under a single administration.

**A) Benefits of GST to Common Man.**

Every tax system affect on a Common man.

- 1) Goods and Services tax system will bring reduction in prices of Goods and Services in most of cases because elimination of cascading effects.
- 2) GST tax system is simple than existing tax system.
- 3) The aim of GST is Providing Uniform tax rates in entire country.
- 4) GST will bring more transparency in indirect tax system.
- 5) Employment opportunity will increases rapidly

**B) Benefits to Trade and industry.**

- 1) GST will bring reduction in multiplicity of cascading taxation. It follows multistate collection mechanism. It means tax is collected at every state and the audit of tax paid at the previous stage is available as a set off at the next stage of transaction.
- 2) GST tax system will bring greater transparency and disclosure in system through returns.
- 3) It will help more efficient neutralization of taxes especially for export.
- 4) GST will shift tax incidence to consumers through systematic way and thus benefit the industry.
- 5) Development of Common National market GST is introduced a uniform taxation law across states and different sectors in respect to indirect taxes which would make it easier to supply goods and services free across the country. No separates compliance of indirect taxes laws. Only GST laws need to be complied resulting in reduction in compliance costs. Multiple records keeping are not necessary.

GST Audit is required to be conducted by a Chartered Accountant or Cost Accountant for a firm having turnover Crore.

**C) Benefits to Government.**

- 1) The uniform SGST and IGST are expected to reduce tax evasion.
- 2) It will improve the overall investment climate and boost foreign investment in India.
- 3) GST is expected to increase Government revenue by widening the tax base and improving the taxpayer compliance.
- 4) GST will give a major boost to the make in India and startup India initiative of the government of India by making goods and services produced in India more competitive in the national market.
- 5) It will bring improvement in export at international market because of uniform tax rates in entire country.

**Impact of GST tax in India** After the GST is implemented there will be certain amount of impact in ever sector. Let us look at these impacts one by one in a brief manner. Some of these impacts can be temporary while others may remain permanent. The impact is expected in a high rate as the sudden change in the game of tax is going bring slight or a huge leap in the world of business depending on the category of business.

**Automobiles:** It will result in 10-17 percent of fall in prices assuming 18 percent GST rate. Lesser benefits might be accrued by the tractors as these are against the taxes paid on input. Though looking on the bright side the automobile sector will emerge as the tax that this field is paying a much higher tax than the tax that will be acquired from it after the GST implementation. It will lead to the easy and direct transfer of vehicles to the dealer. The stock will be transferred to your own warehouse and further will be transferred from warehouse to dealer.

**Textiles** The tax for textile industry is divided into 9 categories at the moment that varies from 4 to 12 percent. The textile sector is also bound to pay taxes to the unorganized players who extract tax based on the size of the business. It depends on the fiber if it is natural or manmade as the synthetic requires high service and the natural requires almost no duty. The mills are taxed at higher rate more than the power looms which discourages the integration of production. The GST implementation will boost exports as it will have no complicated schemes.

**Engineering, capital goods and power equipment** GST will have a positive impact on these and it will improve the prospects of engineering, capital goods and power equipment (ECPE) sector by reducing all the complications. These industries are involved with both manufacturing and servicing of the goods which makes the tax rate of this business high because of double tax and also creates a puzzle ground of structure. This will be broken down into much simpler structure with help of GST due to common tax.

**Hotels** Let us estimate that the GST rate will be 18% in this case the impact will remain neutral as currently the hotels pay 8.7 percent and luxury tax at around 8-12%. Restaurants pay service tax at around 5.6% and VAT at around 12%- 14.5%.

**Logistics** GST will lead to elimination of central sales tax and inter-state value-added tax arbitrage possibilities. This will lead to consolidation of warehouses and increased efficiencies in the logistics chain.

**Pharmaceuticals** It could bring a negative impact on this sector. The indirect paid by this sector could increase by 60 percent which is a thing to worry about and MRP could increase by 4 percent.

**Telecom** All the service related sectors are expected to suffer from this implementation as the service tax might shoot up. Even the moderate rise in tax could blow a hit on demand and profits.

#### **Challenges of GST**

- 1) **IT Infrastructure is Require:** There is a main challenge in front of GST application to develop IT –Infrastructure because all process of GST is online based and every businessman wants to file that's why it infrastructure is require.
- 2) **Office Training:** In any new law the old law as well as the new thought process of trust need to be imbibed. The unlearning of the old law and learning GST provisions is imperative all central and state government officers whether in vat, services tax, excise or customs would have to learn the GST Provision and possible implications viz a viz present gamut of taxes further GST law heavily depend on banks and information technology and hence proper training has to be given to the departmental officers.
- 3) **New Registrants :-** GST is expected to bring within its fold many new registrants will have been hitherto kept outside the preview of tax manly due to exemptions and also since the taxable event is wider in scope in GST transaction of existing registered assesses and registration of new assesses and resolving of migrants issues is a big challenges
- 4) **Increase In Tax Management Expenses:-**Currently many small businesses do not engaged professionals they themselves calculate and pay taxes and file returns on their own to save costs but

in the GST regime they will require professional assistance as the entire system is IT- driven under GST and it is a completely new tax system.

- 5) **Need For New Software For Big Business Houses:-**Currently most of big business houses, firm have been using accounting software for filling tax returns for exercise VAT & Service Tax already incorporated. The change of GST will required them to purchase new software or ERP for filling GST returns and compliances with results in additional cost of purchasing new software.
- 6) **Problem for E-Commerce:-** Now a day's many SMEs operating e -business or online selling through their own website or through third party website will be required to register to all state to sale to different parts of India under GST regime. Furthermore they will require paying taxes like any large organization.

**Conclusion:-**In Spite of all above challenges and myriad problems discuss above GST users a transference to measure taxes levied on a product bringing an end to the host of hidden and embedded taxes that were been paid so far. GST is expected to facilitate free flow of Goods and Services across the country and therefore expected to add to India GDP 1to 1.8 % further reduction in multiple city of taxes will lead to confidence building of foreign investor thus giving a boost to foreign direct investment in the country.

## **AGRICULTURAL MARKETING DEVELOPMENT**

**Prof. Dr. Mane Ashok Nana**

*Department of Commerce, Arts & Commerce College Belapur, Tal- Shrirampur, Dist-Ahmednagar.*

### **PART I: AGRICULTURAL MARKETING DEVELOPMENT**

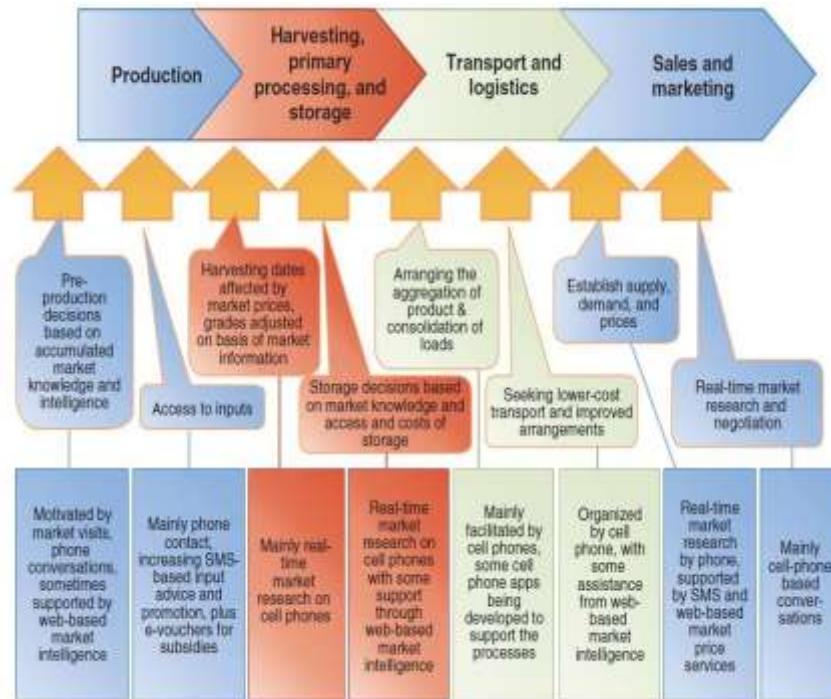

**Introduction:-**Agricultural marketing covers the services involved in moving an agricultural product from the farm to the consumer. Numerous interconnected activities are involved in doing this, such as planning production, growing and harvesting, grading, packing, transport, storage, agro- and food processing, distribution, advertising and sale. Some definitions would even include "The acts of buying supplies, renting equipment, and paying labour", arguing that marketing is everything a business does. Such activities cannot take place without the exchange of information and are often heavily dependent on the availability of suitable finance. Marketing systems are dynamic; they are competitive and involve continuous change and improvement. Businesses that have lower costs, are more efficient, and can deliver quality products, are those that prosper. Those that have high costs, fail to adapt to changes in market demand and provide poorer qualities are often forced out of business. Marketing has to be customer-oriented and has to provide the farmer, transporter, trader, processor, etc. with a profit. This requires those involved in marketing chains to understand buyer requirements, both in terms of product and business conditions.

**Agricultural marketing support:-**In the United States the Agricultural Marketing Service (AMS) is a division of USDA and has programs for cotton, dairy, fruit and vegetable, livestock and seed, poultry, and tobacco. These programs provide testing, standardization, grading and market news services and oversee marketing agreements and orders, administer research and promotion programs, and purchase commodities for federal food programs. The AMS also enforces certain federal laws. USDA also provides support to the Agricultural Marketing Resource Center at Iowa State University and to Penn State University. Several organizations provide support to developing countries to develop their agricultural marketing systems, including FAO's agricultural marketing unit and various donor organizations. There has also recently been considerable interest by NGOs to carry out activities to link farmers to markets. In recent years several developing countries have established government-sponsored marketing or agribusiness units.

#### **Agricultural Marketing Development Is Used In Following Types:-**

1. Agricultural advisory services and the market
2. Market infrastructure
3. Market information
4. Marketing training
5. Enabling environments
6. Recent developments

#### **How it works Example Through Following Diagram:-**

### Types of agricultural markets in India and their classification:-

Market for agricultural produce may broadly be divided into three categories

- Wholesale market
- Retail market
- Fairs

### PART II: Classification of Markets:

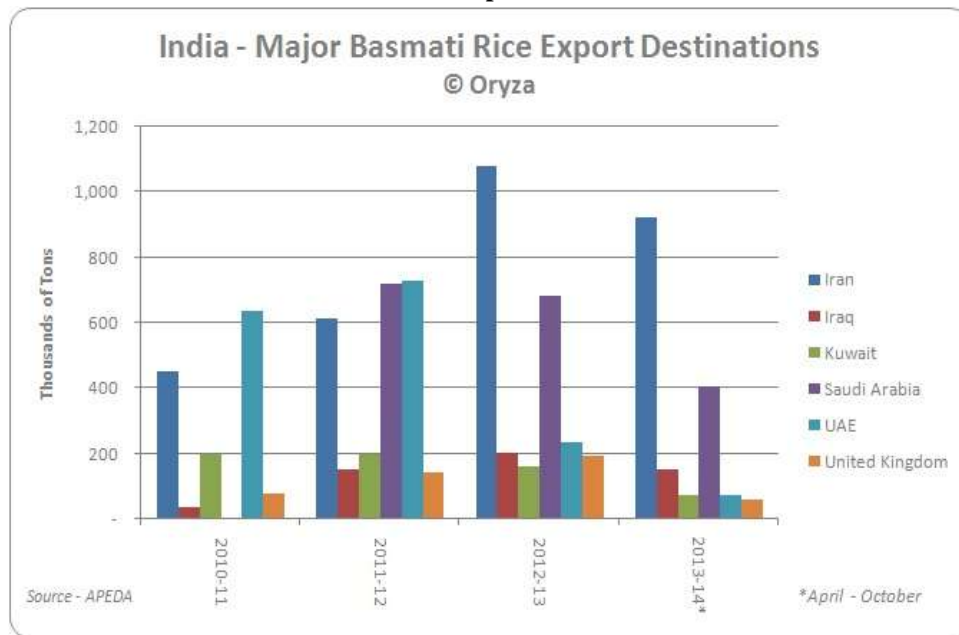

Markets may be classified on the basis of each of the twelve dimensions already listed

1. On the Basis of Location or Place of Operation
2. On the Basis of Area/Coverage
3. On the Basis of Time Span
4. On the Basis of Volumes of Transactions
5. On the Basis of Nature of Transaction
6. On the Basis of Number of Commodities in which Transaction Takes Place
7. On the Basis of Degree of Competition
8. On the Basis of Nature of Commodities
9. On the Basis of Stage of Marketing
10. On the Basis of Extent of Public Intervention
11. On the Basis of Type of Population Served
12. On the Basis of Market Functionaries and Accrual of Marketing Margins

**Example of Basmati Rice which is export of some destinations in few year ago:-**The areas of basmati rice production in India are in the states of Uttar Pradesh, Punjab, Haryana, Rajasthan, Himachal Pradesh, Delhi, Uttarakhand, Madhya Pradesh and Bihar. India's total basmati production for the 2011/12 crop year that ended June was 5 million tonnes.<sup>[6]</sup> In India, Haryana is the major basmati rice cultivating state, producing more than 60% of the total basmati rice produced in India. Example through chart is as follows:-

### Basmati Rice Export Destinations

**Conclusion:-** Agricultural extension reform requires policy vision and determination, and a nationwide strategy that can be implemented. Whether to decentralize and devolve, totally privatize or institute contractual arrangements with the private sector (including venture capital companies, non-governmental organizations, rural producer organizations, and extension advisory service firms), or promote end-user financing (or co-financing) of extension - these are country-specific questions requiring systematic analysis and preparation, gradual change, system coordination and system oversight. A multispectral extension network offers an inclusive approach to rural development. It brings together agricultural extension providers, promotes communication for rural development, and establishes rural extension activities for non-agricultural populations in rural areas as well as an agricultural extension/communication strategy. In all cases where nationally integrated food security systems are being advanced, multiple sectors are encouraged to work collaboratively to combat food insecurity and generate income. In India Agriculture Marketing Development day to day improved. Agriculture product market is developed due to recent changes and development in Marketing system.

## IMPACT OF DEMONETIZATION ON MONEY & BANKING IN INDIA AN APPLICATION OF MULTIPLE LINEAR REGRESSION MODEL

**Dr.Sandip.V.Tile**

Assistant Professor, Department of Economics, KTHM College, Nashik

**Introduction:** Demonetization is an act where the old unit of currency gets retired and replaced with a new currency unit. It can also be considered as withdrawal of a specific currency from market. On November 8, 2016, currency notes of denominations of Rs.1000 and Rs.500 valued at 15.4 trillion and constituting 86.9 per cent of the value of total notes in circulation was demonetized. The act of Demonetization denotes the great need of digitization in the Indian economy. Demonetization led to several changes for the financial sector like significant change in currency demand, relatively rapid growth in bank deposits, detection of suspicious denominations & transactions, Increase the mutual fund investment etc. The fact of the matter is that the Currency in Circulation (CIC), Demand deposit with the banks and deposit kept by other financial institutions (M4) & financial sector especially banking business has experienced drastic changes in their regular trends. During demonetisation and the subsequent period, there has been a distinct increase in saving flows into equity/ debt oriented mutual funds and life insurance policies. Apart from this, non-banking financial companies seem to have recorded improvement in collections and disbursements. The challenge, going forward, would be to channel the funds into productive segments of the economy and expand the footprints of the digital economy, which has undergone a sharp increase □ another important consequence of demonetization. In a nutshell there is statistically significant impact of demonetization on Money stocks & Banking Business in India. The research paper mainly focused on the analysis of the impact of demonetization on money & banking business in India. The researcher has used the multiple linear regression models for this purpose.

### **Objectives of the study:**

- 1) To study the Impact of Demonetization on Money Stock (M4)
- 2) To study the Impact of Demonetization on Banking Business in India

### **Research Methodology:**

#### **1) Hypothesis:**

The following are the main hypothesis of the study:

#### **Main Hypothesis:**

- H1: There is significant impact of Digital Transactions (DTX) on Money Stock in India (M4)
- H1: There is significant impact of Digital Transactions (DTX) on Banking Business in India

#### **Null Hypothesis:**

- H0: There is no significant impact of Digital Transactions (DTX) on Money Stock in India (M4)
- H0: There is no significant impact of Digital Transactions (DTX) on Banking Business in India.
